Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **TME[6:0]**: Trigger memory elements

0: No trigger memory

1-64: Number of trigger memory elements

>64: Values greater than 64 are interpreted as 64

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 15:2 **TMSA[13:0]**: Trigger memory start address.

Start address of trigger memory in message RAM (32-bit word address, see *Figure 728: Message RAM configuration*).

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 1:0 Reserved, must be kept at reset value.

### 59.4.48 FDCAN TT reference message configuration register (FDCAN_TTRMC)

Address offset: 0x0104

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RMPS | XTD | Res. | RID[28:16] | | | | | | | | | | | | |
| rw | rw | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RID[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **RMPS**: Reference message Payload select

Ignored in case of time slaves.

0: Reference message has no additional payload

1: The following elements are taken from Tx buffer 0:

Message marker MM,
Event FIFO control EFC,
Data length code DLC,
Data Bytes DB (level 1: bytes 2-8, level 0, 2: bytes 5-8)
These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 30 **XTD**: Extended identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 29 Reserved, must be kept at reset value.

Bits 28:0 **RID[28:0]**: Reference identifier.

Identifier transmitted with reference message and used for reference message filtering. Standard or extended reference identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

## 59.4.49 FDCAN TT operation configuration register (FDCAN_TTOCF)

Address offset: 0x0108

Reset value: 0x0001 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | EVTP | ECC | EGTF | AWL[7:0] | | | | | | | |
| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EECS | IRTO[6:0] | | | | | | | LDSDL[2:0] | | | TM | GEN | Res. | OM[1:0] | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw | rw |

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **EVTP**: Event trigger polarity.

0: Rising edge trigger

1: Falling edge trigger

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 25 **ECC**: Enable clock calibration.

0: Automatic clock calibration in FDCAN level 0, 2 is disabled

1: Automatic clock calibration in FDCAN level 0, 2 is enabled

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 24 **EGTF**: Enable global time Filtering.

0: Global time filtering in FDCAN level 0, 2 is disabled

1: Global time filtering in FDCAN level 0, 2 is enabled

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 23:16 **AWL[7:0]**: Application watchdog limit.

The application watchdog can be disabled by programming AWL to 0x00.

0x00–FF: Maximum time after which the application has to serve the application watchdog. The application watchdog is incremented once each 256 NTUs.

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 15 **EECS**: Enable external clock synchronization
If enabled, TUR configuration (FDCAN_TURCF.NCL only) may be updated during FDCAN operation.
0: External clock synchronization in FDCAN level 0, 2 disabled
1: External clock synchronization in FDCAN level 0, 2 enabled
These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 14:8 **IRTO[6:0]**: Initial reference trigger offset.
0x00–7F Positive offset, range from 0 to 127
These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 7:5 **LDSDL[2:0]**: LD of synchronization deviation limit.
The synchronization deviation limit SDL is configured by its dual logarithm LDSDL with SDL = 2 * (LDSDL + 5). SDL is comprised between 32 and 4096. It should not exceed the clock tolerance given by the CAN bit timing configuration.
These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 4 **TM**: Time master.
0: Time master function disabled
1: Potential time master
These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 3 **GEN**: Gap enable.
0: Strictly time-triggered operation
1: External event-synchronized time-triggered operation
These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **OM[1:0]**: Operation mode.
00: Event-driven CAN communication, default
01: TTCAN level 1
10: TTCAN level 2
11: TTCAN level 0
These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

### 59.4.50 FDCAN TT matrix limits register (FDCAN_TTMLM)

Address offset: 0x010C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | ENTT[11:0] | | | | | | | | | | | |
| | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **ENTT[11:0]**: Expected Number of Tx triggers

0x000–FFF Expected number of Tx triggers in one matrix cycle.

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TXEW[3:0]**: Tx enable Window

0x0–F Length of Tx enable window, 1-16 NTU cycles

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 7:6 **CSS[1:0]**: Cycle start synchronization

Enables sync pulse output .

00: No sync pulse

01: Sync pulse at start of basic cycle

10: Sync pulse at start of matrix cycle

11: Reserved

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 5:0 **CCM[5:0]:** Cycle count Max

0x00: 1 basic cycle per matrix cycle

0x01: 2 basic cycles per matrix cycle

0x03: 4 basic cycles per matrix cycle

0x07: 8 basic cycles per matrix cycle

0x0F: 16 basic cycles per matrix cycle

0x1F: 32 basic cycles per matrix cycle

0x3F: 64 basic cycles per matrix cycle

Others: Reserved

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

*Note: ISO 11898-4, Section 5.2.1 requires that only the listed cycle count values are configured. Other values are possible, but may lead to inconsistent matrix cycles.*

### 59.4.51 FDCAN TUR configuration register (FDCAN_TURCF)

The length of the NTU is given by: NTU = CAN clock period x NC/DC.

NC is an 18-bit value. Its high part, NCH[17:16] is hard wired to 0b01. Therefore the range of NC extends from 0x10000 to 0x1FFFF. The value configured by NCL is the initial value for

FDCAN_TURNA.NAV[15:0]. DC is set to 0x1000 by hardware reset and it may not be written to 0x0000.

- Level 1: NC 4 × DC and NTU = CAN bit time
- Levels 0 and 2: NC 8 × DC

The actual value of FDCAN_TUR may be changed by the clock drift compensation function of TTCAN level 0 and level 2 in order to adjust the node local view of the NTU to the time master view of the NTU. DC will not be changed by the automatic drift compensation, FDCAN_TURNA.NAV may be adjusted around NC in the range of the synchronization deviation limit given by FDCAN_TTOCF.LDSDL. NC and DC should be programmed to the largest suitable values in achieve the best computational accuracy for the drift compensation process.

Address offset: 0x0110

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ELT | Res. | DC[13:0] | | | | | | | | | | | | | |
| rw | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NCL[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **ELT**: Enable local time.

0: Local time is stopped, default

1: Local time is enabled

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

*Note: The local time is started by setting ELT. It remains active until ELT is reset or until the next hardware reset. FDCAN_TURCF.DC is locked when FDCAN_TURCF.ELT = 1. If ELT is written to 0, the readable value will stay at 1 until the new value has been synchronized into the CAN clock domain. During this time write access to the other bits of the register remains locked.*

Bit 30 Reserved, must be kept at reset value.

Bits 29:16 **DC[13:0]**: Denominator configuration.

0x0000: Illegal value

0x0001 to 0x3FFF: Denominator configuration

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

Bits 15:0 **NCL[15:0]**: Numerator configuration low.

Write access to the TUR numerator configuration low is only possible during configuration with FDCAN_TURCF.ELT = 0 or if FDCAN_TTOCF.EECS (external clock synchronization enabled) is set. When a new value for NCL is written outside TT configuration mode, the new value takes effect when FDCAN_TTOST.WECS is cleared to 0. NCL is locked FDCAN_TTOST.WECS is 1.

0x0000–FFFF Numerator configuration low

These are protected write bits, write access is possible only when bit CCE and bit INIT of FDCAN_CCCR register are set to 1.

*Note: If NC < 7 × DC in TTCAN level 1, it is required that subsequent time marks in the trigger memory must differ by at least two NTUs.*

### 59.4.52 FDCAN TT operation control register (FDCAN_TTOCN)

Address offset: 0x0114

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| LCKC | Res. | ESCN | NIG | TMG | FGP | GCS | TTIE | TMC[1:0] | | RTIE | SWS[1:0] | | SWP | ECS | SGT |
| r | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **LCKC**: TT operation control register Locked.
Set by a write access to register FDCAN_TTOCN. Reset when the updated configuration has been
synchronized into the CAN clock domain.
0: Write access to FDCAN_TTOCN enabled
1: Write access to FDCAN_TTOCN locked

Bit 14 Reserved, must be kept at reset value.

Bit 13 **ESCN**: External synchronization control
If enabled the FDCAN synchronizes its cycle time phase to an external event signaled by a rising edge at event trigger pin (see *Section 59.3.16: Synchronization to external time schedule*).
0: External synchronization disabled
1: External synchronization enabled

Bit 12 **NIG**: Next is Gap.
This bit can only be set when the FDCAN is the actual time master and when it is configured for external event-synchronized time-triggered operation (FDCAN_TTOCF.GEN = 1)
0: No action, reset by reception of any reference message
1: Transmit next reference message with Next_is_Gap = 1

Bit 11 **TMG**: Time mark Gap.
0: Reset by each reference message
1: Next reference message started when register time mark interrupt FDCAN_TTIR.RTMI is activated

Bit 10 **FGP**: Finish Gap.
Set by the CPU, reset by each reference message
0: No reference message requested
1: Application requested start of reference message

Bit 9 **GCS**: Gap control select
0: Gap control independent from event trigger
1: Gap control by input event trigger pin

Bit 8 **TTIE**: Trigger time mark interrupt pulse enable
External time mark events are configured by trigger memory element TMEX. A trigger time mark interrupt pulse is generated when the trigger memory element becomes active, and the FDCAN is in synchronization state In_Schedule or In_Gap.
0: Trigger time mark interrupt output m_ttcan_tmp disabled
1: Trigger time mark interrupt output m_ttcan_tmp enabled

Bits 7:6 **TMC[1:0]**: Register time mark Compare.
00: No Register time mark interrupt generated
01: Register time mark interrupt if time mark = cycle time
10: Register time mark interrupt if time mark = local time
11: Register time mark interrupt if time mark = global time
*Note: When changing the time mark reference (cycle, local, global time), it is recommended to first write TMC = 00, then reconfigure FDCAN_TTTMK, and finally set FDCAN_TMC to the intended time reference.*

Bit 5 **RTIE**: Register time mark interrupt pulse enable.
Register time mark interrupts are configured by register FDCAN_TTTMK. A register time mark interrupt pulse with the length of one m_ttcan_clk period is generated when time referenced by FDCAN_TTOCN.TMC (cycle, local, or global) equals FDCAN_TTTMK.TM, independent of the synchronization state.
0: Register time mark interrupt output disabled
1: Register time mark interrupt output enabled

Bits 4:3 **SWS[1:0]**: Stop watch source.
00: Stop watch disabled
01: Actual value of cycle time is copied to FDCAN_TTCPT.SWV
10: Actual value of local time is copied to FDCAN_TTCPT.SWV
11: Actual value of global time is copied to FDCAN_TTCPT.SWV

Bit 2 **SWP**: Stop watch polarity.
0: Rising edge trigger
1: Falling edge trigger

Bit 1 **ECS**: External clock synchronization.
Writing a 1 to ECS sets FDCAN_TTOST.WECS if the node is the actual time master. ECS is reset after one APB clock period. The external clock synchronization takes effect at the start of the next basic cycle.

Bit 0 **SGT**: Set global time.
Writing a 1 to SGT sets FDCAN_TTOST.WGDT if the node is the actual time master. SGT is reset after one APB clock period. The global time preset takes effect when the node transmits the next reference message with the Master_Ref_Mark modified by the preset value written to FDCAN_TTGTP.

### 59.4.53 FDCAN TT global time preset register (FDCAN_TTGTP)

If TTOST.WGDT is set, the next reference message will be transmitted with the Master_Ref_Mark modified by the preset value and with Disc_Bit = 1, presetting the global time in all nodes simultaneously.

TP is reset to 0x0000 each time a reference message with Disc_Bit = 1 becomes valid or if the node is not the current time master. TP is locked while FDCAN_TTOST.WGTD = 1 after setting FDCAN_TTOCN.SGT until the reference message with Disc_Bit = 1 becomes valid or until the node is no longer the current time master.

Address offset: 0x0118

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TP[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **CTP[15:0]**: Cycle time target phase
CTP is write-protected while FDCAN_TTOCN.ESCN or FDCAN_TTOST.SPL are set (see *Section 59.3.16: Synchronization to external time schedule*).
0x0000–FFFF Defines the target value of cycle time when a rising edge of event trigger is expected

Bits 15:0 **TP[15:0]**: Time Preset.
TP is write-protected while FDCAN_TTOST.WGTD is set.
0x0000–7FFF next master reference mark = master reference mark + TP
0x8000 reserved
0x8001–FFFF Next master reference mark = master reference mark - (0x10000 - TP).

## 59.4.54 FDCAN TT time mark register (FDCAN_TTTMK)

A time mark interrupt (FDCAN_TTIR.TMI = 1) is generated when the time base indicated by FDCAN_TTOCN.TMC (cycle time, local time, or global time) has the same value as TM.

Address offset: 0x011C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **LCKM**: TT time mark register Locked.
Always set by a write access to registers FDCAN_TTOCN. Set by write access to register FDCAN_TTTMK when FDCAN_TTOCN.TMC 00. Reset when the registers have been synchronized into the CAN clock domain.
0: Write access to FDCAN_TTTMK enabled
1: Write access to FDCAN_TTTMK locked

Bits 30:23 Reserved, must be kept at reset value.

Bits 22:16 **TICC[6:0]**: Time mark cycle code.
Cycle count for which the time mark is valid.
0b000000x valid for all cycles
0b000001c valid every second cycle at cycle count mod2 = c
0b00001cc valid every fourth cycle at cycle count mod4 = cc
0b0001ccc valid every eighth cycle at cycle count mod8 = ccc
0b001cccc valid every sixteenth cycle at cycle count mod16 = cccc
0b01ccccc valid every thirty-second cycle at cycle count mod32 = ccccc
0b1cccccc valid every sixty-fourth cycle at cycle count mod64 = cccccc

Bits 15:0 **TM[15:0]**: Time mark.
0x0000–FFFF time mark

*Note: When using byte access to register FDCAN_TTTMK it is recommended to first disable the time mark compare function (FDCAN_TTOCN.TMC = 00) to avoid comparisons on inconsistent register values.*

## 59.4.55 FDCAN TT interrupt register (FDCAN_TTIR)

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset will clear the register.

Address offset: 0x0120

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **CER**: Configuration error.
Trigger out of order.
0: No error found in trigger list
1: Error found in trigger list

Bit 17 **AW**: Application watchdog.
0: Application watchdog served in time
1: Application watchdog not served in time

Bit 16 **WT**: Watch trigger.
0: No missing reference message
1: Missing reference message (level 0: cycle time 0xFF00)

Bit 15 **IWTG**: Initialization watch trigger.
The initialization is restarted by resetting IWT.
0 No missing reference message during system startup
1 No system startup due to missing reference message

Bit 14 **ELC**: Error level Changed.
Not set when error level changed during initialization.
0: No change in error level
1: Error level changed

Bit 13 **SE2**: Scheduling error 2.
0: No scheduling error 2
1: Scheduling error 2 occurred

Bit 12 **SE1**: Scheduling error 1.
0: No scheduling error 1
1: Scheduling error 1 occurred

Bit 11 **TXO**: Tx count overflow.
0: Number of Tx trigger as expected
1: More Tx trigger than expected in one cycle

Bit 10 **TXU**: Tx count underflow.
0: Number of Tx trigger as expected
1: Less Tx trigger than expected in one cycle

Bit 9 **GTE**: Global time error.
Synchronization deviation SD exceeds limit specified by FDCAN_TTOCF.LDSDL, TTCAN level 0, 2 only.
0: Synchronization deviation within limit
1: Synchronization deviation exceeded limit

Bit 8 **GTD**: Global time discontinuity.
0: No discontinuity of global time
1: Discontinuity of global time

Bit 7 **GTW**: Global time wrap
0: No global time wrap occurred
1: Global time wrap from 0xFFFF to 0x0000 occurred

Bit 6 **SWE**: Stop watch event
0: No rising/falling edge at stop watch trigger pin detected
1 :Rising/falling edge at stop watch trigger pin detected

Bit 5 **TTMI:** Trigger time mark event internal
Internal time mark events are configured by trigger memory element TMIN (see *Section 59.3.22: FDCAN trigger memory element*). Set when the trigger memory element becomes active, and the FDCAN is in synchronization state In_Gap or In_Schedule.
0: Time mark not reached
1: Time mark reached (level 0: cycle time FDCAN_TTOCF.RTO x 0x200)

Bit 4 **RTMI**: Register time mark interrupt.
Set when time referenced by TTOCN.TMC (cycle, local, or global) equals FDCAN_TTTMK.TM, independently from the synchronization state.
0: Time mark not reached
1: Time mark reached

Bit 3 **SOG**: Start of Gap
0 No reference message seen with Next_is_Gap bit set
1 Reference message with Next_is_Gap bit set becomes valid

Bit 2 **CSM**: Change of synchronization mode.
0: No change in master to slave relation or schedule synchronization
1: Master to slave relation or schedule synchronization changed,
also set when FDCAN_TTOST.SPL is reset

Bit 1 **SMC**: Start of matrix cycle.
0: No matrix cycle started since bit has been reset
1: Matrix cycle started

Bit 0 **SBC**: Start of basic cycle.
0: No basic cycle started since bit has been reset
1: Basic cycle started

### 59.4.56 FDCAN TT interrupt enable register (FDCAN_TTIE)

The settings in the TT interrupt enable register determine which status changes in the TT interrupt register will result in an interrupt.

Address offset: 0x0124

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

1: TT interrupt enabled

Bit 7 **GTWE**: Global time wrap interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

Bit 6 **SWEE**: Stop watch event interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

Bit 5 **TTMIE:** Trigger time mark event internal interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

Bit 4 **RTMIE**: Register time mark interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

Bit 3 **SOGE**: Start of gap interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

Bit 2 **CSME**: Change of synchronization mode interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

Bit 1 **SMCE**: Start of matrix cycle interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

Bit 0 **SBCE**: Start of basic cycle interrupt enable
0: TT interrupt disabled
1: TT interrupt enabled

### 59.4.57 FDCAN TT interrupt line select register (FDCAN_TTILS)

The TT interrupt Line select register assigns an interrupt generated by a specific interrupt flag from the TT interrupt register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via FDCAN_ILE.EINT0 and FDCAN_ILE.EINT1.

Address offset: 0x0128

0: TT interrupt assigned to interrupt line 0
1: TT interrupt assigned to interrupt line 1

Bit 0 **SBCL:** Start of basic cycle interrupt Line
0: TT interrupt assigned to interrupt line 0
1: TT interrupt assigned to interrupt line 1

### 59.4.58 FDCAN TT operation status register (FDCAN_TTOST)

Address offset: 0x012C

Reset value: 0x0000 0080

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| SPL | WECS | AWE | WFE | GSI | TMP[2:0] | | | GFI | WGTD | Res. | Res. | Res. | Res. | Res. | Res. |
| r | r | r | r | r | r | r | r | r | r | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RTO[7:0] | | | | | | | | QCS | QGTP | SYS[1:0] | | MS[1:0] | | EL[1:0] | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 **SPL**: Schedule phase lock.

The bit is valid only when external synchronization is enabled (FDCAN_TTOCN.ESCN = 1). In this case it signals that the difference between cycle time configured by FDCAN_TTGTP.CTP and the cycle time at the rising edge at event trigger pin is less or equal 9 NTU (see *Section 59.3.16: Synchronization to external time schedule*).

0: Phase outside range

1: Phase inside range

Bit 30 **WECS**: Wait for external clock synchronization.

0: No external clock synchronization pending

1: Node waits for external clock synchronization to take effect. The bit is reset at the start of the next basic cycle.

Bit 29 **AWE**: Application watchdog event.

The application watchdog is served by reading FDCAN_TTOST. When the watchdog is not served in time, bit AWE is set, all FDCAN communication is stopped, and the FDCAN is set into bus monitoring mode.

0: Application watchdog served in time

1: Failed to serve application watchdog in time

Bit 28 **WFE**: Wait for event.

0: No Gap announced, reset by a reference message with Next_is_Gap = 0

1: Reference message with Next_is_Gap = 1 received

Bit 27 **GSI**: Gap started Indicator.

0: No Gap in schedule, reset by each reference message and for all time slaves

1: Gap time after basic cycle has started

Bits 26:24 **TMP[2:0]**: Time master priority.

0x0-7 Priority of actual time master

Bit 23 **GFI**: Gap finished Indicator.

Set when the CPU writes FDCAN_TTOCN.FGP, or by a time mark interrupt if TMG = 1, or via input pin (event trigger) if FDCAN_TTOCN.GCS = 1. Not set by Ref_Trigger_Gap or when Gap is finished by another node sending a reference message.

0: Reset at the end of each reference message

1: Gap finished by FDCAN

Bit 22 **WGTD**: Wait for global time discontinuity.

0: No global time preset pending

1: Node waits for the global time preset to take effect. The bit is reset when the node has transmitted a reference message with Disc_Bit = 1 or after it received a reference message.

Bits 21:16 Reserved, must be kept at reset value.

Bits 15:8 **RTO[7:0]**: Reference trigger offset.
The reference trigger offset value is a signed integer with a range from -127 (0x81) to 127 (0x7F). There is no notification when the lower limit of-127 is reached. In case the FDCAN becomes time master (MS[1:0] = 11), the reset of RTO is delayed due to synchronization between Host and CAN clock domain. For time slaves the value configured by FDCAN_TTOCF.IRTO is read.
0x00-FF Actual reference trigger offset value

Bit 7 **QCS**: Quality of clock Speed.
Only relevant in TTCAN level 0 and level 2, otherwise fixed to 1.
0: Local clock speed not synchronized to time master clock speed
1: Synchronization deviation ≤ SDL

Bit 6 **QGTP**: Quality of global time phase.
Only relevant in TTCAN level 0 and level 2, otherwise fixed to 0.
0: Global time not valid
1: Global time in phase with time master

Bits 5:4 **SYS[1:0]**: Synchronization state
00: Out of Synchronization
01: Synchronizing to FDCAN communication
10: Schedule suspended by Gap (In_Gap)
11: Synchronized to schedule (In_Schedule)

Bits 3:2 **MS[1:0]**: Master state.
00: Master_Off, no master properties relevant
01: Operating as time Slave
10: Operating as backup time master
11: Operating as current time master

Bits 1:0 **EL[1:0]**: Error level.
00: Severity 0 - No error
01: Severity 1 - Warning
10: Severity 2 - error
11: Severity 3 - Severe error

### 59.4.59 FDCAN TUR numerator actual register (FDCAN_TURNA)

There is no drift compensation in TTCAN level 1 (NAV = NC). In TTCAN level 0 and level 2, the drift between the node local clock and the time master local clock is calculated. The drift is compensated when the synchronization deviation (difference between NC and the calculated NAV) is lower than 2 * (FDCAN_TTOCF.LDSDL + 5). With FDCAN_TTOCF.LDSDL < 7, this results in a maximum range for NAV of (NC - 0x1000) ≤ NAV ≤ (NC + 0x1000).

Address offset: 0x0130

Reset value: 0x0000 0000

| LT[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 **GT[15:0]**: Global time.
Non-fractional part of the sum of the node local time and its local offset (see *Section 59.3.11: Local time, cycle time, global time, and external clock synchronization*).
0x0000–FFFF Global time value of FDCAN network

Bits 15:0 **LT[15:0]**: Local time.
Non-fractional part of local time, incremented once each local NTU (see *Section 59.3.11: Local time, cycle time, global time, and external clock synchronization*).
0x0000–FFFF Local time value of FDCAN node

## 59.4.61 FDCAN TT cycle time and count register (FDCAN_TTCTC)

Address offset: 0x0138

Reset value: 0x003F 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC[5:0] | | | | | |
| | | | | | | | | | | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CT[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **CC[5:0]**: Cycle count.
0x00–3F Number of actual basic cycle in the system matrix

Bits 15:0 **CT[15:0]**: Cycle time
Non-fractional part of the difference of the node local time and Ref_Mark (see *Section 59.3.11: Local time, cycle time, global time, and external clock synchronization*).
0x0000–FFFF Cycle time value of FDCAN basic cycle

## 59.4.62 FDCAN TT capture time register (FDCAN_TTCPT)

Address offset: 0x013C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| SWV[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CCV[5:0] | | | | | |
| | | | | | | | | | | r | r | r | r | r | r |

Bits 31:16 **SWV[15:0]**: Stop watch value.
On a rising / falling edge (as configured via FDCAN_TTOCN.SWP) at the stop watch trigger pin, when FDCAN_TTOCN.SWS] is different from 00 and FDCAN_TTIR.SWE is 0, the actual time value as selected by FDCAN_TTOCN.SWS (cycle, local, global) is copied to SWV and TFDCAN_TIR.SWE will be set to 1.Capturing of the next stop watch value is enabled by resetting FDCAN_TTIR.SWE.
0x0000–FFFF Captured stop watch value

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **CCV[5:0]**: Cycle count value
Cycle count value captured together with SWV.
0x00–3F Captured cycle count value

## 59.4.63 FDCAN TT cycle sync mark register (FDCAN_TTCSM)

Address offset: 0x0140

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CSM[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CSM[15:0]**: Cycle sync mark.

The cycle sync mark is measured in cycle time. It is updated when the reference message becomes valid and retains its value until the next reference message becomes valid.

0x0000–FFFF Captured cycle time

## 59.4.64 FDCAN TT trigger select register (FDCAN_TTTS)

The settings in the FDCAN_TTTS register select the input to be used as event trigger and stop watch trigger.

Address offset: 0x0300

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 **REL[3:0]**: Core release = 1

Bits 27:24 **STEP[3:0]**: Step of core release = 1

Bits 23:20 **SUBSTEP[3:0]**: Sub-step of core release = 1

Bits 19:16 **YEAR[3:0]**: Timestamp year =

Bits 15:8 **MON[7:0]**: Timestamp month = 12

Bits 7:0 **DAY[7:0]**: Timestamp day = 18

## 59.5.2 Calibration configuration register (FCCAN_CCU_CCFG)

Address offset: 0x0004

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| SWR | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CDIV[3:0] | | | |
| rw | | | | | | | | | | | | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| OCPM[7:0] | | | | | | | | CFL | BCC | Res. | TQBT[4:0] | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw | rw | rw | rw | rw |

Bit 31 **SWR**: Software Reset

Writing a 1 to this bit will reset the calibration FSM to state Not_Calibrated (CCU_CSTAT.CALS = 00). The calibration watchdog value CWD.WDV is also reset. Registers FDCAN_CCFG, CCU_CSTAT and the calibration watchdog configuration CWD.WDC are unchanged. The bit remains set until reset is completed.

Write access by the Host CPU to registers/bits marked with “P=Protected Write” is possible only when the FDCAN control bits FDCAN_CCCR.CCE = 1 AND FDCAN_CCCR.INIT = 1.

Bits 30:20 Reserved, must be kept at reset value.

Bits 19:16 **CDIV[3:0]**: Clock Divider

The clock divider has to be configured when the clock calibration is bypassed (BCC = 1) to ensure that the FDCAN requirement is fulfilled.

0000: Divide by 1
0001: Divide by 2
0010: Divide by 4
0011: Divide by 6
0100: Divide by 8
0101: Divide by 10
0110: Divide by 12
0111: Divide by 14
1000: Divide by 16
1001: Divide by 18
1010: Divide by 20
1011: Divide by 22
1100: Divide by 24
1101: Divide by 26
1110: Divide by 28
1111: Divide by 30

Write access by the Host CPU to registers/bits marked with “P=Protected Write” is possible only when the FDCAN control bits FDCAN_CCCR.CCE = 1 AND FDCAN_CCCR.INIT = 1.

Bits 15:8 **OCPM[7:0]**: Oscillator clock periods minimum

Configures the minimum number of periods in two CAN bit times. OCPM is used in basic calibration to avoid false measurements in case of glitches on the bus line. The configured number of periods is OCPM × 32. The configuration depends on the frequency (from 80 to 100 MHz) and the bitrate configured in FDCAN1 and FDCAN2 (from 125 kbit/s up to 1 Mbit/s). It is recommended to configure a value slightly below two CAN bit times. The reset value is 1.6 bit times at 80 MHz fdcan_ker_ck and 1 Mbit/s CAN bitrate.

Write access by the Host CPU to registers/bits marked with “P=Protected Write” is possible only when the FDCAN control bits FDCAN_CCCR.CCE = 1 AND FDCAN_CCCR.INIT = 1.

Bit 7 **CFL**: Calibration Field length

0: Calibration field length is 32 bits

1: Calibration field length is 64 bits

Write access by the Host CPU to registers/bits marked with “P=Protected Write” is possible only when the FDCAN control bits FDCAN_CCCR.CCE = 1 AND FDCAN_CCCR.INIT = 1.

Bit 6 **BCC**: Bypass clock calibration

If this bit is set, the clock input fdcan_ker_ck is routed to the time quanta clock through a clock divider configurable via CDIV, cu_cok is always 1. In this case the baudrate prescaler of the connected FDCANs has to be configured to generate the FDCAN internal time quanta clock.

0: Clock calibration unit generates time quanta clock

1: Clock calibration unit bypassed (default configuration)

*Note: As long as fdcan_ker_ck is equal or above 80 MHz the clock calibration on CAN unit is functional, even when BCC = 1. The calibration state can be read from register CCU_CSTAT.*

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **TQBT[4:0]**: Time quanta per bit time

Configures the number of time quanta per bit time. Same value as configured in FDCAN1 and FDCAN2. The range of the resulting time quanta clock fdcan_tq_ck is from 0.5 MHz (bitrate of 125 kbit/s with 4 tq per bit time) to 25 MHz (bitrate of 1 Mbit/s with 25 tq per bit time). Valid values are 4 to 25. Configured values below 4 are interpreted as 4, values above 25 are interpreted as 25.

Write access by the Host CPU to registers/bits marked with “P=Protected Write” is possible only when the FDCAN control bits FDCAN_CCCR.CCE = 1 AND FDCAN_CCCR.INIT = 1.

## 59.5.3 Calibration status register (FCCAN_CCU_CSTAT)

Address offset: 0x0008

Reset value: 0x0203 FFFF

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:30 **CALS[1:0]**: Calibration state

00: Not_Calibrated

01: Basic_Calibrated

10: Precision_Calibrated

11: Reserved

Bit 29 Reserved, must be kept at reset value.

Bits 28:18 **TQC[10:0]**: Time quanta counter

Captured number of time quanta in calibration field (32 or 64 bits). Only valid when the clock calibration unit is in state Precision_Calibrated.

Bits 17:0 **OCPC[17:0]**: Oscillator clock period counter

Captured number of oscillator clock periods in calibration field (32 or 64 bits). Only valid when the clock calibration unit is in state Precision_Calibrated.

## 59.5.4 Calibration watchdog register (FCCAN_CCU_CWD)

Address offset: 0x000C

Reset value: 0x0000 0000

The calibration watchdog is started after the first falling edge when the calibration FSM is in state Not_Calibrated (CCU_CSTAT.CALS = 00). In this state the calibration watchdog monitors the message received. In case no message was received until the calibration watchdog has counted down to 0, the calibration FSM stays in state Not_Calibrated (CCU_CSTAT.CALS = 00), the counter is reloaded with FDCAN_RWD.WDC and basic calibration is restarted after the next falling edge.

When in state Basic_Calibrated (CCU_CSTAT.CALS = 01), the calibration watchdog is restarted with each received message . In case no message was received until the calibration watchdog has counted down to 0, the calibration FSM returns to state Not_Calibrated (CCU_CSTAT.CALS = 00), the counter is reloaded with FDCAN_RWD.WDC and basic calibration is restarted after the next falling edge.

When a quartz message is received, state Precision_Calibrated (CCU_CSTAT.CALS = 10) is entered and the calibration watchdog is restarted. In this state the calibration watchdog monitors the quartz message received input. In case no message from a quartz controlled node is received by the attached TTCAN until the calibration watchdog has counted down to 0, the calibration FSM transits back to state Basic_Calibrated (CCU_CSTAT.CALS = 01). The signal is active when the CAN protocol engine on the attached TTCAN is started i.e. when the INIT bit is reset.

A calibration watchdog event also sets interrupt flag CCU_IR.CWE. If enabled by CCU_IE.CWEE, interrupt line is activated (set to high). Interrupt line remains active until interrupt flag CCU_IR.CWE is reset.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| WDV[15:0] | | | | | | | | | | | | | | | |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **WDV[15:0]**: Watchdog value
Actual calibration watchdog counter value.

Bits 15:0 **WDC[15:0]**: WDC
Watchdog configuration
Start value of the calibration watchdog counter. With the reset value of 00 the counter is disabled.
Write access by the Host CPU to registers/bits marked with “P = Protected Write” is possible only when the FDCAN control bits FDCAN_CCCR.CCE = 1 AND FDCAN_CCCR.INIT = 1.

### 59.5.5 Clock calibration unit interrupt register (FCCAN_CCU_IR)

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset will clear the register. The configuration of CCU_IE controls whether an interrupt is generated or not.

Address offset: 0x0010

Reset value: 0x0000 0000

# 60 USB on-the-go high-speed (OTG)

## 60.1 Introduction

This section presents the architecture and the programming model of the OTG controller.

The following acronyms are used throughout the section:

| | |
|---|---|
| FS | Full-speed |
| LS | Low-speed |
| HS | High-speed |
| MAC | Media access controller |
| OTG | On-the-go |
| PFC | Packet FIFO controller |
| PHY | Physical layer |
| USB | Universal serial bus |
| UTMI | USB 2.0 Transceiver Macrocell interface (UTMI) |
| LPM | Link power management |
| BCD | Battery charging detector |
| HNP | Host negotiation protocol |
| SRP | Session request protocol |

References are made to the following documents:

- USB On-The-Go Supplement, Revision 2.0
- Universal Serial Bus Revision 2.0 Specification
- USB 2.0 Link Power Management Addendum Engineering Change Notice to the USB 2.0 specification, July 16, 2007
- Errata for USB 2.0 ECN: Link Power Management (LPM) - 7/2007
- Battery Charging Specification, Revision 1.2

The USB OTG is a dual-role device (DRD) controller that supports both device and host functions and is fully compliant with the *On-The-Go Supplement to the USB 2.0 Specification*. It can also be configured as a host-only or device-only controller, fully compliant with the *USB 2.0 Specification.* OTG supports the speeds defined in the *Table 455: OTG speeds supported* below.The USB OTG supports both HNP and SRP. The only external device required is a charge pump for $V_{BUS}$ in OTG mode.

**Table 455. OTG speeds supported**

| - | HS (480 Mb/s) | FS (12 Mb/s) | LS (1.5 Mb/s) |
|---|---|---|---|
| Host mode | X | X | X |
| Device mode | X | X | - |

## 60.2 OTG main features

The main features can be divided into three categories: general, host-mode and device-mode features.

### 60.2.1 General features

The OTG interface general features are the following:

- It is USB-IF certified to the Universal Serial Bus Specification Rev 2.0
- OTG supports the following PHY interfaces:
  - An on-chip full-speed PHY
  - A UTMI interface for internal HS PHY
- It includes full support (PHY) for the optional On-The-Go (OTG) protocol detailed in the On-The-Go Supplement Rev 2.0 specification
  - Integrated support for A-B device identification (ID line)
  - Integrated support for host Negotiation protocol (HNP) and session request protocol (SRP)
  - It allows host to turn $V_{BUS}$ off to conserve battery power in OTG applications
  - It supports OTG monitoring of $V_{BUS}$ levels with internal comparators
  - It supports dynamic host-peripheral switch of role
- It is software-configurable to operate as:
  - SRP capable USB HS Peripheral (B-device)
  - SRP capable USB HS/LS host (A-device)
  - USB On-The-Go Full-Speed Dual Role device
- It supports HS SOF and LS Keep-alives with
  - SOF pulse PAD connectivity
  - SOF pulse internal connection to timer (TIMx)
  - Configurable framing period
  - Configurable end of frame interrupt
- OTG embeds an internal DMA with shareholding support and software selectable AHB burst type in DMA mode.
- It supports Descriptor-Based Scatter/Gather DMA controller for device and host mode. (Descriptor-Based Congruent-Sequential DMA is not supported). Scatter/Gather DMA operation is supported in both device and host mode. This feature will improve performance for device mode isochronous endpoints. Note that hubs (split transfers)

are not supported in host scatter/gather DMA mode of operation. Split transfers are supported only in host buffer DMA (internal DMA) mode of operation.

- It includes power saving features such as system stop during USB suspend, switch-off of clock domains internal to the digital core, PHY and DFIFO power management.
- It features a dedicated RAM of 4 Kbytes with advanced FIFO control:
  - Configurable partitioning of RAM space into different FIFOs for flexible and efficient use of RAM
  - Each FIFO can hold multiple packets
  - Dynamic memory allocation
  - Configurable FIFO sizes that are not powers of 2 to allow the use of contiguous memory locations
- It guarantees max USB bandwidth for up to one frame (1 ms) without system intervention.
- It supports charging port detection as described in Battery Charging Specification Revision 1.2 on the FS PHY transceiver only.

### 60.2.2 Host-mode features

The OTG interface main features and requirements in host-mode are the following:

- External charge pump for $V_{BUS}$ voltage generation.
- Up to 16 host channels (pipes): each channel is dynamically reconfigurable to allocate any type of USB transfer.
- Built-in hardware scheduler holding:
  - Up to 16 interrupt plus isochronous transfer requests in the periodic hardware queue
  - Up to 16 control plus bulk transfer requests in the non-periodic hardware queue
- Management of a shared Rx FIFO, a periodic Tx FIFO and a nonperiodic Tx FIFO for efficient usage of the USB data RAM.

### 60.2.3 Peripheral-mode features

The OTG interface main features in peripheral-mode are the following:

- 1 bidirectional control endpoint0
- 8 IN endpoints (EPs) configurable to support bulk, interrupt or isochronous transfers
- 8 OUT endpoints configurable to support bulk, interrupt or isochronous transfers
- Management of a shared Rx FIFO and a Tx-OUT FIFO for efficient usage of the USB data RAM
- Management of up to 9 dedicated Tx-IN FIFOs (one for each active IN EP) to put less load on the application
- Support for the soft disconnect feature.

## 60.3 OTG implementation

**Table 456. OTG implementation(1)**

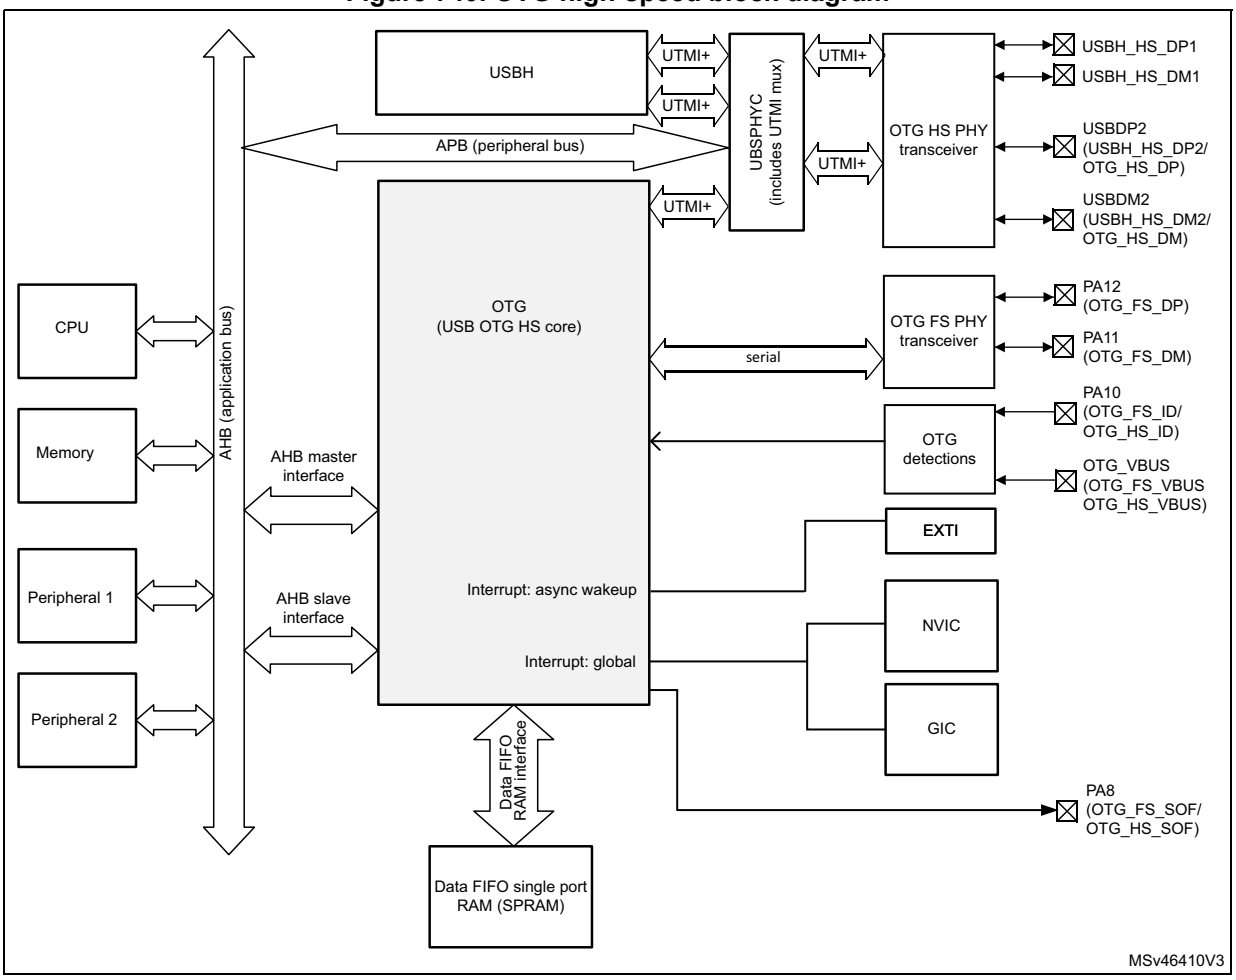
| USB features | OTG for STM32MP15xxx |
|---|---|
| Device bidirectional endpoints (including EP0) | 9 |
| Host mode channels | 16 |
| Size of dedicated SRAM | 4 KB |
| USB 2.0 link power management (LPM) support | X |
| OTG revision supported | 2.0 |
| Attach detection protocol (ADP) support | - |
| Battery charging detection (BCD) support | X |
| ULPI available to primary IOs via muxing | - |
| Integrated PHY | FS and HS |
| Scatter/gather DMA | X |
| Dedicated interrupt lines for EP1 | - |

1. “X” = supported, “-” = not supported, “FS” = supported in FS mode, “HS” = supported in HS mode.

## 60.4 OTG functional description

### 60.4.1 OTG block diagram

**Figure 740. OTG high-speed block diagram**



### 60.4.2 USB OTG pin and internal signals

**Table 457. OTG input/output pins**

| Signal name | Signal type | Description |
|---|---|---|
| OTG_HS_DP | Digital input/output | USB OTG D+ line |
| OTG_HS_DM | Digital input/output | USB OTG D- line |
| OTG_FS_DP | Digital input/output | USB OTG D+ line (FS PHY) |
| OTG_FS_DM | Digital input/output | USB OTG D- line (FS PHY) |
| OTG_HS_ID | Digital input | USB OTG ID |
| OTG_HS_VBUS | Analog input | USB OTG VBUS |
| OTG_HS_SOF | Digital output | USB OTG Start Of Frame (visibility) |

**Table 457. OTG input/output pins (continued)**

| Signal name | Signal type | Description |
|---|---|---|
| OTG_FS_ID | Digital input/output | USB OTG ID (use this pin with FS PHY) |
| OTG_FS_VBUS | Digital input/output | USB OTG VBUS (use this pin with FS PHY) |
| OTG_FS_SOF | Digital input/output | USB OTG Start Of Frame (visibility, use this pin with FS PHY) |

**Table 458. OTG input/output signals**

| Signal name | Signal type | Description |
|---|---|---|
| usb_sof | Digital output | USB OTG start-of-frame event for on chip peripherals |
| usb_wkup | Digital output | USB OTG wakeup event output |
| usb_gbl_it | Digital output | USB OTG global interrupt |

### 60.4.3 OTG core

The USB OTG receives the 48 MHz clock from the reset and clock controller (RCC), see *Figure 82: Peripheral clock distribution for USB*. The USB clock is used for driving the 48 MHz domain at full-speed (12 Mbit/s) and must be enabled prior to configuring the OTG core.

The CPU reads and writes from/to the OTG core registers through the AHB peripheral bus. It is informed of USB events through the single USB OTG interrupt line described in *Section 60.12: OTG interrupts*.

The CPU submits data over the USB by writing 32-bit words to dedicated OTG locations (push registers). The data are then automatically stored into Tx-data FIFOs configured within the USB data RAM. There is one Tx FIFO push register for each in-endpoint (peripheral mode) or out-channel (host mode).

The CPU receives the data from the USB by reading 32-bit words from dedicated OTG addresses (pop registers). The data are then automatically retrieved from a shared Rx FIFO configured within the 4-Kbyte USB data RAM. There is one Rx FIFO pop register for each out-endpoint or in-channel.

The USB protocol layer is driven by the serial interface engine (SIE) and serialized over the USB by the transceiver module within the on-chip physical layer (PHY).

### 60.4.4 Embedded full speed OTG PHY

The full-speed OTG PHY includes the following components:

- FS/LS transceiver module used by both host and device. It directly drives transmission and reception on the single-ended USB lines.
- integrated ID pull-up resistor used to sample the ID line for A/B device identification.
- DP/DM integrated pull-up and pull-down resistors controlled by the OTG core depending on the current role of the device. As a peripheral, it enables the DP pull-up resistor to signal full-speed peripheral connections as soon as $V_{BUS}$ is sensed to be at a valid level (B-session valid). In host mode, pull-down resistors are enabled on both

DP/DM. Pull-up and pull-down resistors are dynamically switched when the peripheral role is changed via the host negotiation protocol (HNP).

- Pull-up/pull-down resistor ECN circuit. The DP pull-up consists of 2 resistors controlled separately from the OTG as per the resistor Engineering Change Notice applied to USB Rev2.0. The dynamic trimming of the DP pull-up strength allows to achieve a better noise rejection and Tx/Rx signal quality.
- $V_{BUS}$ sensing comparators with hysteresis used to detect $V_{BUS}$ valid, A-B session valid and session-end voltage thresholds. They are used to drive the session request protocol (SRP), detect valid startup and end-of-session conditions, and constantly monitor the $V_{BUS}$ supply during USB operations.

To guarantee a correct operation for the USB OTG peripheral, the AHB frequency should be higher than 30 MHz.

### 60.4.5 High-speed OTG PHY

The USB OTG core includes an internal UTMI interface which is connected to an internal HS PHY (see *Section 60.4.1: OTG block diagram*).

## 60.5 OTG dual role device (DRD)

### 60.5.1 ID line detection

The host or peripheral (the default) role is assumed depending on the ID input pin. The ID line status is determined on plugging in the USB cable, depending on whether a MicroA or MicroB plug is connected to the micro-AB receptacle.

- If the B-side of the USB cable is connected with a floating ID wire, the integrated pull-up resistor detects a high ID level and the default peripheral role is confirmed. In this configuration the OTG complies with the standard FSM described in section 4.2.4: ID pin of the On-the-Go specification Rev2.0, supplement to the USB2.0.
- If the A-side of the USB cable is connected with a grounded ID, the OTG issues an ID line status change interrupt (CIDSCHG bit in OTG_GINTSTS) for host software initialization, and automatically switches to the host role. In this configuration the OTG complies with the standard FSM described by section 4.2.4: ID pin of the On-the-Go specification Rev2.0, supplement to the USB2.0.

### 60.5.2 HNP dual role device

The HNP capable bit in the Global USB configuration register (HNPCAP bit in OTG_ GUSBCFG) enables the OTG core to dynamically change its role from A-host to A-peripheral and vice-versa, or from B-Peripheral to B-host and vice-versa according to the host negotiation protocol (HNP). The current device status can be read by the combined values of the connector ID status bit in the Global OTG control and status register (CIDSTS bit in OTG_GOTGCTL) and the current mode of operation bit in the global interrupt and status register (CMOD bit in OTG_GINTSTS).

The HNP program model is described in detail in *Section 60.15: OTG programming model*.

### 60.5.3 SRP dual role device

The SRP capable bit in the global USB configuration register (SRPCAP bit in OTG_GUSBCFG) enables the OTG core to switch off the generation of $V_{BUS}$ for the A-device to save power. Note that the A-device is always in charge of driving $V_{BUS}$ regardless of the host or peripheral role of the OTG.

The SRP A/B-device program model is described in detail in *Section 60.15: OTG programming model*.

## 60.6 USB peripheral

This section gives the functional description of the OTG in the USB peripheral mode. The OTG works as an USB peripheral in the following circumstances:

- OTG B-Peripheral
  - OTG B-device default state if B-side of USB cable is plugged in
- OTG A-Peripheral
  - OTG A-device state after the HNP switches the OTG to its peripheral role
- B-device
  - If the ID line is present, functional and connected to the B-side of the USB cable, and the HNP-capable bit in the Global USB Configuration register (HNPCAP bit in OTG_GUSBCFG) is cleared.
- Peripheral only
  - The force device mode bit (FDMOD) in the *Section 60.14.4: OTG USB configuration register (OTG_GUSBCFG)* is set to 1, forcing the OTG core to work as an USB peripheral-only. In this case, the ID line is ignored even if it is present on the USB connector.

*Note: To build a bus-powered device implementation in case of the B-device or peripheral-only configuration, an external regulator has to be added, that generates the necessary power-supply from $V_{BUS}$.*

### 60.6.1 SRP-capable peripheral

The SRP capable bit in the Global USB configuration register (SRPCAP bit in OTG_GUSBCFG) enables the OTG to support the session request protocol (SRP). In this way, it allows the remote A-device to save power by switching off $V_{BUS}$ while the USB session is suspended.

The SRP peripheral mode program model is described in detail in the *B-device session request protocol* section.

### 60.6.2 Peripheral states

#### Powered state

The $V_{BUS}$ input detects the B-session valid voltage by which the USB peripheral is allowed to enter the powered state (see USB2.0 section 9.1). The OTG then automatically connects the DP pull-up resistor to signal full-speed device connection to the host and generates the session request interrupt (SRQINT bit in OTG_GINTSTS) to notify the powered state.

The $V_{BUS}$ input also ensures that valid $V_{BUS}$ levels are supplied by the host during USB operations. If a drop in $V_{BUS}$ below B-session valid happens to be detected (for instance because of a power disturbance or if the host port has been switched off), the OTG automatically disconnects and the session end detected (SEDET bit in OTG_GOTGINT) interrupt is generated to notify that the OTG has exited the powered state.

In the powered state, the OTG expects to receive some reset signaling from the host. No other USB operation is possible. When a reset signaling is received the reset detected interrupt (USBRST in OTG_GINTSTS) is generated. When the reset signaling is complete, the enumeration done interrupt (ENUMDNE bit in OTG_GINTSTS) is generated and the OTG enters the Default state.

#### Soft disconnect

The powered state can be exited by software with the soft disconnect feature. The DP pull-up resistor is removed by setting the soft disconnect bit in the device control register (SDIS bit in OTG_DCTL), causing a device disconnect detection interrupt on the host side even though the USB cable was not really removed from the host port.

#### Default state

In the Default state the OTG expects to receive a SET_ADDRESS command from the host. No other USB operation is possible. When a valid SET_ADDRESS command is decoded on the USB, the application writes the corresponding number into the device address field in the device configuration register (DAD bit in OTG_DCFG). The OTG then enters the address state and is ready to answer host transactions at the configured USB address.

#### Suspended state

The OTG peripheral constantly monitors the USB activity. After counting 3 ms of USB idleness, the early suspend interrupt (ESUSP bit in OTG_GINTSTS) is issued, and confirmed 3 ms later, if appropriate, by the suspend interrupt (USBSUSP bit in OTG_GINTSTS). The device suspend bit is then automatically set in the device status register (SUSPSTS bit in OTG_DSTS) and the OTG enters the suspended state.

The suspended state may optionally be exited by the device itself. In this case the application sets the remote wakeup signaling bit in the device control register (RWUSIG bit in OTG_DCTL) and clears it after 1 to 15 ms.

When a resume signaling is detected from the host, the resume interrupt (WKUPINT bit in OTG_GINTSTS) is generated and the device suspend bit is automatically cleared.

### 60.6.3 Peripheral endpoints

The OTG core instantiates the following USB endpoints:

- Control endpoint 0:
  - Bidirectional and handles control messages only
  - Separate set of registers to handle in and out transactions
  - Proper control (OTG_DIEPCTL0/OTG_DOEPCTL0), transfer configuration (OTG_DIEPTSIZ0/OTG_DOEPTSIZ0), and status-interrupt

(OTG_DIEPINT0/)OTG_DOEPINT0) registers. The available set of bits inside the control and transfer size registers slightly differs from that of other endpoints

- 8 IN endpoints
  - Each of them can be configured to support the isochronous, bulk or interrupt transfer type
  - Each of them has proper control (OTG_DIEPCTL*x*), transfer configuration (OTG_DIEPTSIZ*x*), and status-interrupt (OTG_DIEPINT*x*) registers
  - The device IN endpoints common interrupt mask register (OTG_DIEPMSK) is available to enable/disable a single kind of endpoint interrupt source on all of the IN endpoints (EP0 included)
  - Support for incomplete isochronous IN transfer interrupt (IISOIXFR bit in OTG_GINTSTS), asserted when there is at least one isochronous IN endpoint on which the transfer is not completed in the current frame. This interrupt is asserted along with the end of periodic frame interrupt (OTG_GINTSTS/EOPF).
- 8 OUT endpoints
  - Each of them can be configured to support the isochronous, bulk or interrupt transfer type
  - Each of them has a proper control (OTG_DOEPCTL*x*), transfer configuration (OTG_DOEPTSIZ*x*) and status-interrupt (OTG_DOEPINT*x*) register
  - Device OUT endpoints common interrupt mask register (OTG_DOEPMSK) is available to enable/disable a single kind of endpoint interrupt source on all of the OUT endpoints (EP0 included)
  - Support for incomplete isochronous OUT transfer interrupt (INCOMPISOOUT bit in OTG_GINTSTS), asserted when there is at least one isochronous OUT endpoint on which the transfer is not completed in the current frame. This interrupt is asserted along with the end of periodic frame interrupt (OTG_GINTSTS/EOPF).

### Endpoint control

- The following endpoint controls are available to the application through the device endpoint-*x* IN/OUT control register (OTG_DIEPCTL*x*/OTG_DOEPCTL*x*):
  - Endpoint enable/disable
  - Endpoint activate in current configuration
  - Program USB transfer type (isochronous, bulk, interrupt)
  - Program supported packet size
  - Program Tx FIFO number associated with the IN endpoint
  - Program the expected or transmitted data0/data1 PID (bulk/interrupt only)
  - Program the even/odd frame during which the transaction is received or transmitted (isochronous only)
  - Optionally program the NAK bit to always negative-acknowledge the host regardless of the FIFO status
  - Optionally program the STALL bit to always stall host tokens to that endpoint
  - Optionally program the SNOOP mode for OUT endpoint not to check the CRC field of received data

### Endpoint transfer

The device endpoint-*x* transfer size registers (OTG_DIEPTSIZ*x*/OTG_DOEPTSIZ*x*) allow the application to program the transfer size parameters and read the transfer status. Programming must be done before setting the endpoint enable bit in the endpoint control register. Once the endpoint is enabled, these fields are read-only as the OTG core updates them with the current transfer status.

The following transfer parameters can be programmed:

- Transfer size in bytes
- Number of packets that constitute the overall transfer size

### Endpoint status/interrupt

The device endpoint-*x* interrupt registers (OTG_DIEPINT*x*/OTG_DOPEPINT*x)* indicate the status of an endpoint with respect to USB- and AHB-related events. The application must read these registers when the OUT endpoint interrupt bit or the IN endpoint interrupt bit in the core interrupt register (OEPINT bit in OTG_GINTSTS or IEPINT bit in OTG_GINTSTS, respectively) is set. Before the application can read these registers, it must first read the device all endpoints interrupt (OTG_DAINT) register to get the exact endpoint number for the device endpoint-*x* interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG_DAINT and OTG_GINTSTS registers

The peripheral core provides the following status checks and interrupt generation:

- Transfer completed interrupt, indicating that data transfer was completed on both the application (AHB) and USB sides
- Setup stage has been done (control-out only)
- Associated transmit FIFO is half or completely empty (in endpoints)
- NAK acknowledge has been transmitted to the host (isochronous-in only)
- IN token received when Tx FIFO was empty (bulk-in/interrupt-in only)
- Out token received when endpoint was not yet enabled
- Babble error condition has been detected
- Endpoint disable by application is effective
- Endpoint NAK by application is effective (isochronous-in only)
- More than 3 back-to-back setup packets were received (control-out only)
- Timeout condition detected (control-in only)
- Isochronous out packet has been dropped, without generating an interrupt

## 60.7 USB host

This section gives the functional description of the OTG in the USB host mode. The OTG works as a USB host in the following circumstances:

- OTG A-host
  - OTG A-device default state when the A-side of the USB cable is plugged in
- OTG B-host
  - OTG B-device after HNP switching to the host role
- A-device
  - If the ID line is present, functional and connected to the A-side of the USB cable, and the HNP-capable bit is cleared in the Global USB Configuration register (HNPCAP bit in OTG_GUSBCFG). Integrated pull-down resistors are automatically set on the DP/DM lines.
- Host only
  - The force host mode bit (FHMOD) in the *OTG USB configuration register (OTG_GUSBCFG)* forces the OTG core to work as a USB host-only. In this case, the ID line is ignored even if present on the USB connector. Integrated pull-down resistors are automatically set on the DP/DM lines.

*Note: On-chip 5 V $V_{BUS}$ generation is not supported. For this reason, a charge pump or, if 5 V are available on the application board, a basic power switch must be added externally to drive the 5 V $V_{BUS}$ line. The external charge pump can be driven by any GPIO output. This is required for the OTG A-host, A-device and host-only configurations.*

### 60.7.1 SRP-capable host

SRP support is available through the SRP capable bit in the global USB configuration register (SRPCAP bit in OTG_GUSBCFG). With the SRP feature enabled, the host can save power by switching off the $V_{BUS}$ power while the USB session is suspended.

The SRP host mode program model is described in detail in the *A-device session request protocol*) section.

### 60.7.2 USB host states

#### Host port power

On-chip 5 V $V_{BUS}$ generation is not supported. For this reason, a charge pump or, if 5 V are available on the application board, a basic power switch, must be added externally to drive the 5 V $V_{BUS}$ line. The external charge pump can be driven by any GPIO output or via an $I^2C$ interface connected to an external PMIC (power management IC). When the application decides to power on $V_{BUS}$, it must also set the port power bit in the host port control and status register (PPWR bit in OTG_HPRT).

#### $V_{BUS}$ valid

When HNP or SRP is enabled the VBUS sensing pin should be connected to $V_{BUS}$. The $V_{BUS}$ input ensures that valid $V_{BUS}$ levels are supplied by the charge pump during USB operations. Any unforeseen $V_{BUS}$ voltage drop below the $V_{BUS}$ valid threshold (4.4 V) leads to an OTG interrupt triggered by the session end detected bit (SEDET bit in OTG_GOTGINT). The application is then required to remove the $V_{BUS}$ power and clear the port power bit.

When HNP and SRP are both disabled, the VBUS sensing pin does not need to be connected to $V_{BUS}$ and it can be used as GPIO.

The charge pump overcurrent flag can also be used to prevent electrical damage. Connect the overcurrent flag output from the charge pump to any GPIO input and configure it to generate a port interrupt on the active level. The overcurrent ISR must promptly disable the $V_{BUS}$ generation and clear the port power bit.

### Host detection of a peripheral connection

If SRP or HNP are enabled, even if USB peripherals or B-devices can be attached at any time, the OTG will not detect any bus connection until $V_{BUS}$ is no longer sensed at a valid level (5 V). When $V_{BUS}$ is at a valid level and a remote B-device is attached, the OTG core issues a host port interrupt triggered by the device connected bit in the host port control and status register (PCDET bit in OTG_HPRT).

When HNP and SRP are both disabled, USB peripherals or B-device are detected as soon as they are connected. The OTG core issues a host port interrupt triggered by the device connected bit in the host port control and status (PCDET bit in OTG_HPRT).

### Host detection of peripheral a disconnection

The peripheral disconnection event triggers the disconnect detected interrupt (DISCINT bit in OTG_GINTSTS).

### Host enumeration

After detecting a peripheral connection the host must start the enumeration process by sending USB reset and configuration commands to the new peripheral.

Before starting to drive a USB reset, the application waits for the OTG interrupt triggered by the debounce done bit (DBCDNE bit in OTG_GOTGINT), which indicates that the bus is stable again after the electrical debounce caused by the attachment of a pull-up resistor on DP (FS) or DM (LS).

The application drives a USB reset signaling (single-ended zero) over the USB by keeping the port reset bit set in the host port control and status register (PRST bit in OTG_HPRT) for a minimum of 10 ms and a maximum of 20 ms. The application takes care of the timing count and then of clearing the port reset bit.

Once the USB reset sequence has completed, the host port interrupt is triggered by the port enable/disable change bit (PENCHNG bit in OTG_HPRT). This informs the application that the speed of the enumerated peripheral can be read from the port speed field in the host port control and status register (PSPD bit in OTG_HPRT) and that the host is starting to drive SOFs (FS) or Keep alives (LS). The host is now ready to complete the peripheral enumeration by sending peripheral configuration commands.

### Host suspend

The application decides to suspend the USB activity by setting the port suspend bit in the host port control and status register (PSUSP bit in OTG_HPRT). The OTG core stops sending SOFs and enters the suspended state.

The suspended state can be optionally exited on the remote device's initiative (remote wakeup). In this case the remote wakeup interrupt (WKUPINT bit in OTG_GINTSTS) is generated upon detection of a remote wakeup signaling, the port resume bit in the host port control and status register (PRES bit in OTG_HPRT) self-sets, and resume signaling is

automatically driven over the USB. The application must time the resume window and then clear the port resume bit to exit the suspended state and restart the SOF.

If the suspended state is exited on the host initiative, the application must set the port resume bit to start resume signaling on the host port, time the resume window and finally clear the port resume bit.

### 60.7.3 Host channels

The OTG core instantiates 16 host channels. Each host channel supports an USB host transfer (USB pipe). The host is not able to support more than 16 transfer requests at the same time. If more than 16 transfer requests are pending from the application, the host controller driver (HCD) must re-allocate channels when they become available from previous duty, that is, after receiving the transfer completed and channel halted interrupts.

Each host channel can be configured to support in/out and any type of periodic/nonperiodic transaction. Each host channel makes us of proper control (OTG_HCCHAR*x*), transfer configuration (OTG_HCTSIZ*x*) and status/interrupt (OTG_HCINT*x*) registers with associated mask (OTG_HCINTMSK*x*) registers.

#### Host channel control

- The following host channel controls are available to the application through the host channel-*x* characteristics register (OTG_HCCHAR*x*):
  - Channel enable/disable
  - Program the HS/FS/LS speed of target USB peripheral
  - Program the address of target USB peripheral
  - Program the endpoint number of target USB peripheral
  - Program the transfer IN/OUT direction
  - Program the USB transfer type (control, bulk, interrupt, isochronous)
  - Program the maximum packet size (MPS)
  - Program the periodic transfer to be executed during odd/even frames

#### Host channel transfer

The host channel transfer size registers (OTG_HCTSIZ*x*) allow the application to program the transfer size parameters, and read the transfer status. Programming must be done before setting the channel enable bit in the host channel characteristics register. Once the endpoint is enabled the packet count field is read-only as the OTG core updates it according to the current transfer status.

- The following transfer parameters can be programmed:
  - transfer size in bytes
  - number of packets making up the overall transfer size
  - initial data PID

#### Host channel status/interrupt

The host channel-*x* interrupt register (OTG_HCINT*x*) indicates the status of an endpoint with respect to USB- and AHB-related events. The application must read these register when the host channels interrupt bit in the core interrupt register (HCINT bit in OTG_GINTSTS) is set. Before the application can read these registers, it must first read the host all channels interrupt (OTG_HAINT) register to get the exact channel number for the

host channel-x interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG_HAINT and OTG_GINTSTS registers. The mask bits for each interrupt source of each channel are also available in the OTG_HCINTMSKx register.

- The host core provides the following status checks and interrupt generation:
  - Transfer completed interrupt, indicating that the data transfer is complete on both the application (AHB) and USB sides
  - Channel has stopped due to transfer completed, USB transaction error or disable command from the application
  - Associated transmit FIFO is half or completely empty (IN endpoints)
  - ACK response received
  - NAK response received
  - STALL response received
  - USB transaction error due to CRC failure, timeout, bit stuff error, false EOP
  - Babble error
  - frame overrun
  - data toggle error

### 60.7.4 Host scheduler

The host core features a built-in hardware scheduler which is able to autonomously re-order and manage the USB transaction requests posted by the application. At the beginning of each frame the host executes the periodic (isochronous and interrupt) transactions first, followed by the nonperiodic (control and bulk) transactions to achieve the higher level of priority granted to the isochronous and interrupt transfer types by the USB specification.

The host processes the USB transactions through request queues (one for periodic and one for nonperiodic). Each request queue can hold up to 8 entries. Each entry represents a pending transaction request from the application, and holds the IN or OUT channel number along with other information to perform a transaction on the USB. The order in which the requests are written to the queue determines the sequence of the transactions on the USB interface.

At the beginning of each frame, the host processes the periodic request queue first, followed by the nonperiodic request queue. The host issues an incomplete periodic transfer interrupt (IPXFR bit in OTG_GINTSTS) if an isochronous or interrupt transaction scheduled for the current frame is still pending at the end of the current frame. The OTG core is fully responsible for the management of the periodic and nonperiodic request queues.The periodic transmit FIFO and queue status register (OTG_HPTXSTS) and nonperiodic transmit FIFO and queue status register (OTG_HNPTXSTS) are read-only registers which can be used by the application to read the status of each request queue. They contain:

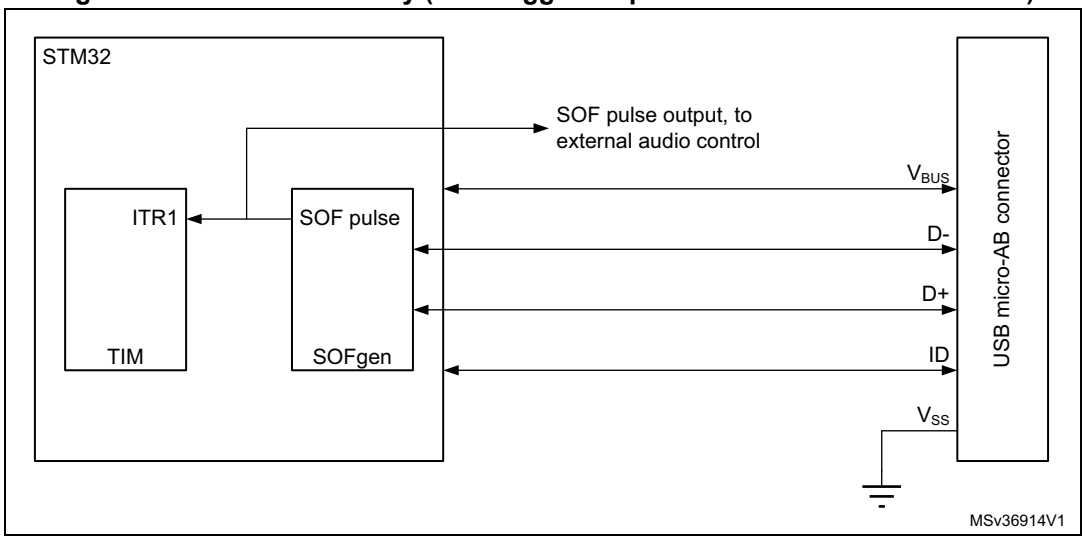
- The number of free entries currently available in the periodic (nonperiodic) request queue (8 max)
- Free space currently available in the periodic (nonperiodic) Tx FIFO (out-transactions)
- IN/OUT token, host channel number and other status information.

As request queues can hold a maximum of 8 entries each, the application can push to schedule host transactions in advance with respect to the moment they physically reach the SB for a maximum of 8 pending periodic transactions plus 8 pending non-periodic transactions.

To post a transaction request to the host scheduler (queue) the application must check that there is at least 1 entry available in the periodic (nonperiodic) request queue by reading the PTXQSAV bits in the OTG_HNPTXSTS register or NPTQXSAV bits in the OTG_HNPTXSTS register.

## 60.8 SOF trigger

**Figure 741. SOF connectivity (SOF trigger output to TIM and ITR1 connection)**



The OTG core provides means to monitor, track and configure SOF framing in the host and peripheral, as well as an SOF pulse output connectivity feature.

Such utilities are especially useful for adaptive audio clock generation techniques, where the audio peripheral needs to synchronize to the isochronous stream provided by the PC, or the host needs to trim its framing rate according to the requirements of the audio peripheral.

### 60.8.1 Host SOFs

In host mode the number of PHY clocks occurring between the generation of two consecutive SOF (HS/FS) or Keep-alive (LS) tokens is programmable in the host frame interval register (HFIR), thus providing application control over the SOF framing period. An interrupt is generated at any start of frame (SOF bit in OTG_GINTSTS). The current frame number and the time remaining until the next SOF are tracked in the host frame number register (HFNUM).

A SOF pulse signal, is generated at any SOF starting token and with a width of 20 HCLK cycles. The SOF pulse is also internally connected to the input trigger of the timer, so that the input capture feature, the output compare feature and the timer can be triggered by the SOF pulse.

### 60.8.2 Peripheral SOFs

In device mode, the start of frame interrupt is generated each time an SOF token is received on the USB (SOF bit in OTG_GINTSTS). The corresponding frame number can be read from the device status register (FNSOF bit in OTG_DSTS). A SOF pulse signal with a width of 20 HCLK cycles is also generated.The SOF pulse signal is also internally connected to

the TIM input trigger, so that the input capture feature, the output compare feature and the timer can be triggered by the SOF pulse.

The end of periodic frame interrupt (OTG_GINTSTS/EOPF) is used to notify the application when 80%, 85%, 90% or 95% of the time frame interval elapsed depending on the periodic frame interval field in the device configuration register (PFIVL bit in OTG_DCFG). This feature can be used to determine if all of the isochronous traffic for that frame is complete.

## 60.9 OTG low-power modes

*Table 459* below defines the STM32 low power modes and their compatibility with the OTG.

**Table 459. Compatibility of STM32 low power modes with the OTG**

| Mode | Description | USB compatibility |
|---|---|---|
| Run | MCU fully active | Required when USB not in suspend state. |
| Sleep | USB suspend exit causes the device to exit Sleep mode. Peripheral registers content is kept. | Available while USB is in suspend state. |
| Stop | USB suspend exit causes the device to exit Stop mode. Peripheral registers content is kept(1). | Available while USB is in suspend state. |
| Standby | Powered-down. The peripheral must be reinitialized after exiting Standby mode. | Not compatible with USB applications. |

1. Within Stop mode there are different possible settings. Some restrictions may also exist, please refer to *Section 9: Power control (PWR)* to understand which (if any) restrictions apply when using OTG.

The following bits and procedures reduce power consumption.

The power consumption of the OTG PHY is controlled by two or three bits in the general core configuration register, depending on OTG revision supported.

- PHY power down (OTG_GCCFG/PWRDWN)

  It switches on/off the full-speed transceiver module of the PHY. It must be preliminarily set to allow any USB operation
- $V_{BUS}$ detection enable (OTG_GCCFG/VBDEN)

  It switches on/off the $V_{BUS}$ sensing comparators associated with OTG operations

Power reduction techniques are available while in the USB suspended state, when the USB session is not yet valid or the device is disconnected.

- Stop PHY clock (STPPCLK bit in OTG_PCGCCTL)

  When setting the stop PHY clock bit in the clock gating control register, most of the 48 MHz clock domain internal to the OTG full-speed core is switched off by clock gating. The dynamic power consumption due to the USB clock switching activity is cut even if the 48 MHz clock input is kept running by the application

  Most of the transceiver is also disabled, and only the part in charge of detecting the asynchronous resume or remote wakeup event is kept alive.
- Gate HCLK (GATEHCLK bit in OTG_PCGCCTL)

  When setting the Gate HCLK bit in the clock gating control register, most of the system clock domain internal to the OTG core is switched off by clock gating. Only the register read and write interface is kept alive. The dynamic power consumption due to the USB

clock switching activity is cut even if the system clock is kept running by the application for other purposes.

- USB system stop

  When the OTG is in the USB suspended state, the application may decide to drastically reduce the overall power consumption by a complete shut down of all the clock sources in the system. USB System Stop is activated by first setting the Stop PHY clock bit and then configuring the system deep sleep mode in the power control system module (PWR).

  The OTG core automatically reactivates both system and USB clocks by asynchronous detection of remote wakeup (as an host) or resume (as a device) signaling on the USB.

To save dynamic power, the USB data FIFO is clocked only when accessed by the OTG core.

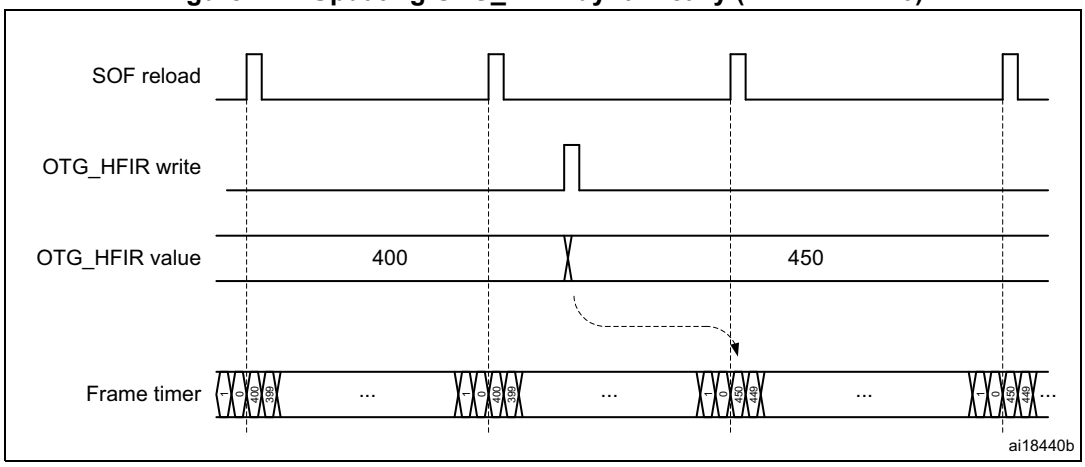
## 60.10 Dynamic update of the OTG_HFIR register

The USB core embeds a dynamic trimming capability of micro-SOF framing period in host mode allowing to synchronize an external device with the micro-SOF frames.

When the OTG_HFIR register is changed within a current micro-SOF frame, the SOF period correction is applied in the next frame as described in *Figure 742*.

For a dynamic update, it is required to set RLDCTRL=0.

**Figure 742. Updating OTG_HFIR dynamically (RLDCTRL = 0)**

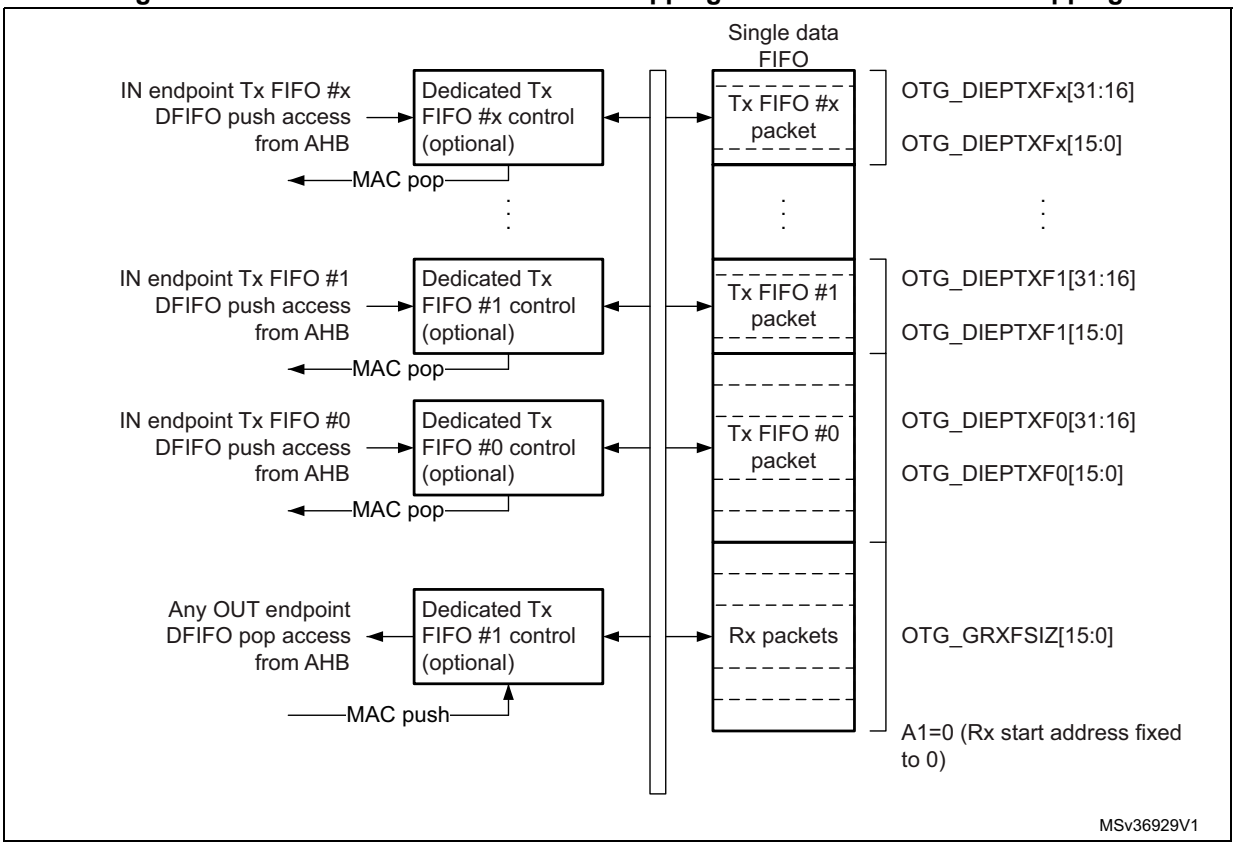


## 60.11 USB data FIFOs

The USB system features 4 Kbytes of dedicated RAM with a sophisticated FIFO control mechanism. The packet FIFO controller module in the OTG core organizes RAM space into Tx FIFOs into which the application pushes the data to be temporarily stored before the USB transmission, and into a single Rx FIFO where the data received from the USB are temporarily stored before retrieval (popped) by the application. The number of instructed FIFOs and how these are organized inside the RAM depends on the device's role. In peripheral mode an additional Tx FIFO is instructed for each active IN endpoint. Any FIFO size is software configured to better meet the application requirements.

### 60.11.1 Peripheral FIFO architecture

**Figure 743. Device-mode FIFO address mapping and AHB FIFO access mapping**



#### Peripheral Rx FIFO

The OTG peripheral uses a single receive FIFO that receives the data directed to all OUT endpoints. Received packets are stacked back-to-back until free space is available in the Rx FIFO. The status of the received packet (which contains the OUT endpoint destination number, the byte count, the data PID and the validity of the received data) is also stored by the core on top of the data payload. When no more space is available, host transactions are NACKed and an interrupt is received on the addressed endpoint. The size of the receive FIFO is configured in the receive FIFO size register (OTG_GRXFSIZ).

The single receive FIFO architecture makes it more efficient for the USB peripheral to fill in the receive RAM buffer:

- All OUT endpoints share the same RAM buffer (shared FIFO)
- The OTG core can fill in the receive FIFO up to the limit for any host sequence of OUT tokens

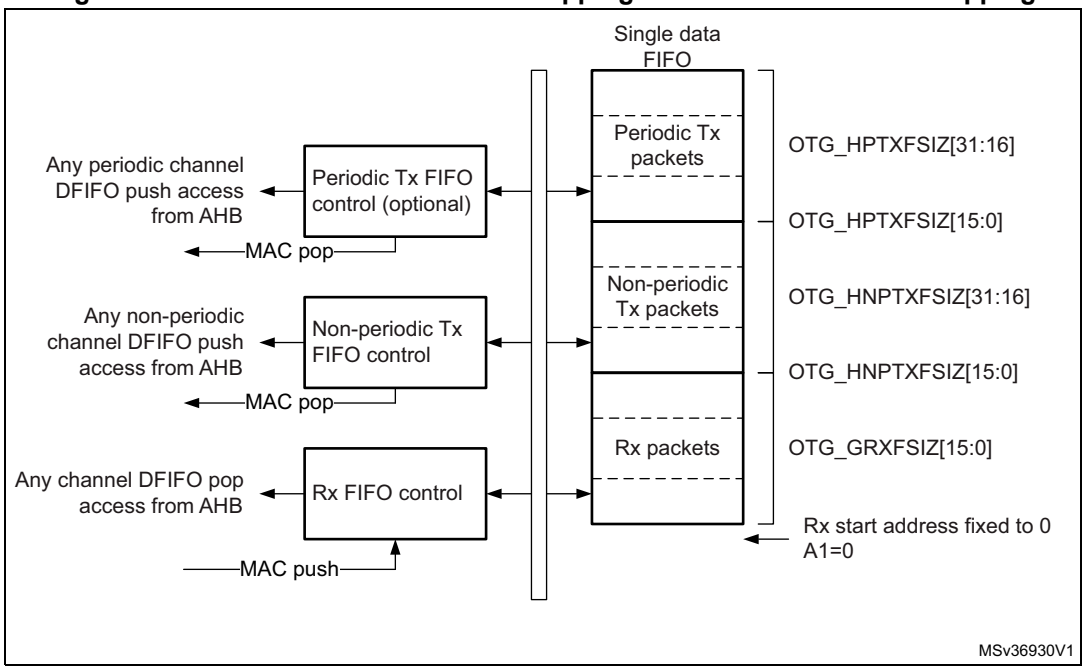
The application keeps receiving the Rx FIFO non-empty interrupt (RXFLVL bit in OTG_GINTSTS) as long as there is at least one packet available for download. It reads the packet information from the receive status read and pop register (OTG_GRXSTSP) and finally pops data off the receive FIFO by reading from the endpoint-related pop address.

### Peripheral Tx FIFOs

The core has a dedicated FIFO for each IN endpoint. The application configures FIFO sizes by writing the endpoint 0 transmit FIFO size register (OTG_DIEPTXF0) for IN endpoint0 and the device IN endpoint transmit FIFOx registers (OTG_DIEPTXFx) for IN endpoint-x.

## 60.11.2 Host FIFO architecture

**Figure 744. Host-mode FIFO address mapping and AHB FIFO access mapping**



### Host Rx FIFO

The host uses one receiver FIFO for all periodic and nonperiodic transactions. The FIFO is used as a receive buffer to hold the received data (payload of the received packet) from the USB until it is transferred to the system memory. Packets received from any remote IN endpoint are stacked back-to-back until free space is available. The status of each received packet with the host channel destination, byte count, data PID and validity of the received data are also stored into the FIFO. The size of the receive FIFO is configured in the receive FIFO size register (OTG_GRXFSIZ).

The single receive FIFO architecture makes it highly efficient for the USB host to fill in the receive data buffer:

- All IN configured host channels share the same RAM buffer (shared FIFO)
- The OTG core can fill in the receive FIFO up to the limit for any sequence of IN tokens driven by the host software

The application receives the Rx FIFO not-empty interrupt as long as there is at least one packet available for download. It reads the packet information from the receive status read and pop register and finally pops the data off the receive FIFO.

### Host Tx FIFOs

The host uses one transmit FIFO for all non-periodic (control and bulk) OUT transactions and one transmit FIFO for all periodic (isochronous and interrupt) OUT transactions. FIFOs are used as transmit buffers to hold the data (payload of the transmit packet) to be transmitted over the USB. The size of the periodic (nonperiodic) Tx FIFO is configured in the host periodic (nonperiodic) transmit FIFO size OTG_HPTXFSIZ / OTG_HNPTXFSIZ) register.

The two Tx FIFO implementation derives from the higher priority granted to the periodic type of traffic over the USB frame. At the beginning of each frame, the built-in host scheduler processes the periodic request queue first, followed by the nonperiodic request queue.

The two transmit FIFO architecture provides the USB host with separate optimization for periodic and nonperiodic transmit data buffer management:

- All host channels configured to support periodic (nonperiodic) transactions in the OUT direction share the same RAM buffer (shared FIFOs)
- The OTG core can fill in the periodic (nonperiodic) transmit FIFO up to the limit for any sequence of OUT tokens driven by the host software

The OTG core issues the periodic Tx FIFO empty interrupt (PTXFE bit in OTG_GINTSTS) as long as the periodic Tx FIFO is half or completely empty, depending on the value of the periodic Tx FIFO empty level bit in the AHB configuration register (PTXFELVL bit in OTG_GAHBCFG). The application can push the transmission data in advance as long as free space is available in both the periodic Tx FIFO and the periodic request queue. The host periodic transmit FIFO and queue status register (OTG_HPTXSTS) can be read to know how much space is available in both.

OTG core issues the non periodic Tx FIFO empty interrupt (NPTXFE bit in OTG_GINTSTS) as long as the nonperiodic Tx FIFO is half or completely empty depending on the non periodic Tx FIFO empty level bit in the AHB configuration register (TXFELVL bit in OTG_GAHBCFG). The application can push the transmission data as long as free space is available in both the nonperiodic Tx FIFO and nonperiodic request queue. The host nonperiodic transmit FIFO and queue status register (OTG_HNPTXSTS) can be read to know how much space is available in both.

## 60.11.3 FIFO RAM allocation

### Device mode

**Receive FIFO RAM allocation:** the application should allocate RAM for SETUP packets:

- 10 locations must be reserved in the receive FIFO to receive SETUP packets on control endpoint. The core does not use these locations, which are reserved for SETUP packets, to write any other data.
- One location is to be allocated for Global OUT NAK.
- Status information is written to the FIFO along with each received packet. Therefore, a minimum space of (largest packet size / 4) + 1 must be allocated to receive packets. If multiple isochronous endpoints are enabled, then at least two (largest packet size / 4) + 1 spaces must be allocated to receive back-to-back packets. Typically, two (largest packet size / 4) + 1 spaces are recommended so that when the previous packet is being transferred to the CPU, the USB can receive the subsequent packet.
- Along with the last packet for each endpoint, transfer complete status information is also pushed to the FIFO. One location for each OUT endpoint is recommended.

Device RxFIFO =

(5 * number of control endpoints + 8) + ((largest USB packet used / 4) + 1 for status information) + (2 * number of OUT endpoints) + 1 for Global NAK

Example: The MPS is 1,024 bytes for a periodic USB packet and 512 bytes for a non-periodic USB packet. There are three OUT endpoints, three IN endpoints, one control endpoint, and three host channels.

Device RxFIFO = (5 * 1 + 8) + ((1,024 / 4) +1) + (2 * 4) + 1 = 279

**Transmit FIFO RAM allocation:** the minimum RAM space required for each IN endpoint Transmit FIFO is the maximum packet size for that particular IN endpoint.

*Note: More space allocated in the transmit IN endpoint FIFO results in better performance on the USB.*

### Host mode

Receive FIFO RAM allocation:

Status information is written to the FIFO along with each received packet. Therefore, a minimum space of (largest packet size / 4) + 1 must be allocated to receive packets. If multiple isochronous channels are enabled, then at least two (largest packet size / 4) + 1 spaces must be allocated to receive back-to-back packets. Typically, two (largest packet size / 4) + 1 spaces are recommended so that when the previous packet is being transferred to the CPU, the USB can receive the subsequent packet.

Along with the last packet in the host channel, transfer complete status information is also pushed to the FIFO. So one location must be allocated for this.

Host RxFIFO = (largest USB packet used / 4) + 1 for status information + 1 transfer complete

Example: Host RxFIFO = ((1,024 / 4) + 1) + 1 = 258

Transmit FIFO RAM allocation:

The minimum amount of RAM required for the host Non-periodic Transmit FIFO is the largest maximum packet size among all supported non-periodic OUT channels.

Typically, two largest packet sizes worth of space is recommended, so that when the current packet is under transfer to the USB, the CPU can get the next packet.

Non-Periodic TxFIFO = largest non-periodic USB packet used / 4

Example: Non-Periodic TxFIFO = (512 / 4) = 128

The minimum amount of RAM required for host periodic Transmit FIFO is the largest maximum packet size out of all the supported periodic OUT channels. If there is at least one isochronous OUT endpoint, then the space must be at least two times the maximum packet size of that channel.

Host Periodic TxFIFO = largest periodic USB packet used / 4

Example: Host Periodic TxFIFO = (1,024 / 4) = 256

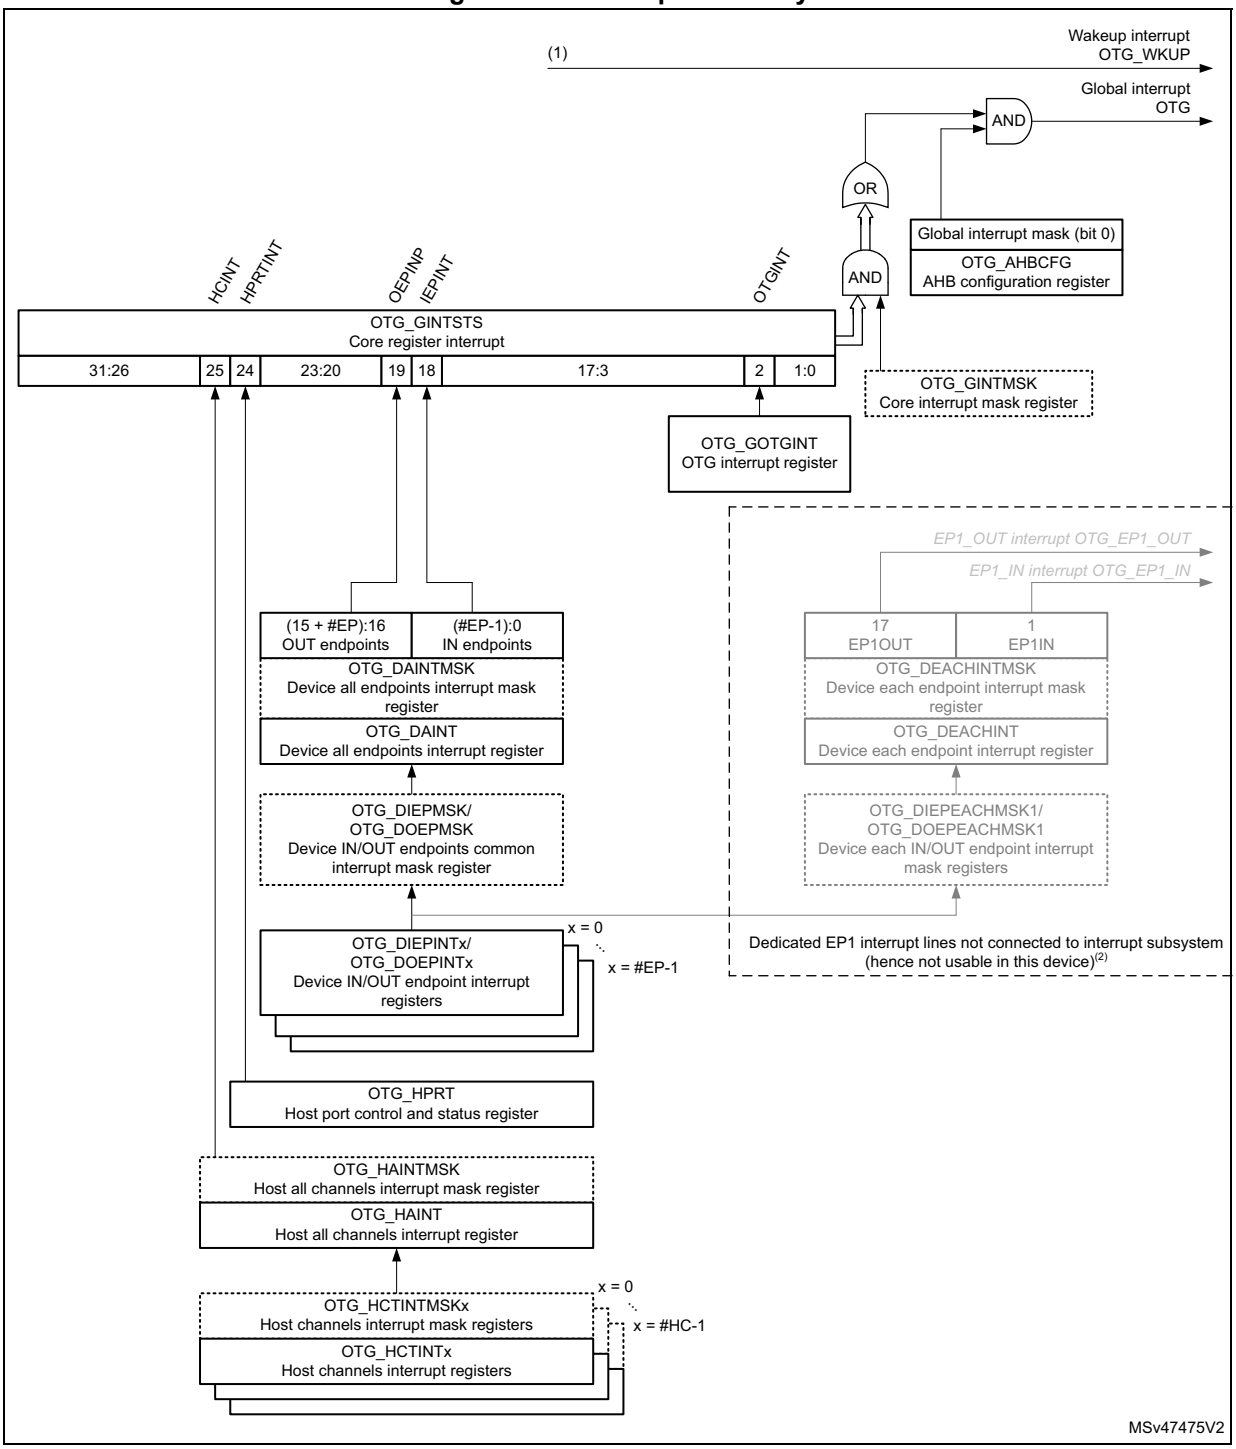
*Note: More space allocated in the Transmit Non-periodic FIFO results in better performance on the USB.*

## 60.12 OTG interrupts

When the OTG controller is operating in one mode, either device or host, the application must not access registers from the other mode. If an illegal access occurs, a mode mismatch interrupt is generated and reflected in the core interrupt register (MMIS bit in the OTG_GINTSTS register). When the core switches from one mode to the other, the registers in the new mode of operation must be reprogrammed as they would be after a power-on reset.

*Figure 745* shows the interrupt hierarchy.

**Figure 745. Interrupt hierarchy**



1. OTG_WKUP becomes active (high state) when resume condition occurs during L1 SLEEP or L2 SUSPEND states.
2. See *Table 456: OTG implementation*.

## 60.13 OTG control and status registers

By reading from and writing to the control and status registers (CSRs) through the AHB slave interface, the application controls the OTG controller. These registers are 32 bits wide, and the addresses are 32-bit block aligned. The OTG registers must be accessed by words (32 bits).

CSRs are classified as follows:

- Core global registers
- Host-mode registers
- Host global registers
- Host port CSRs
- Host channel-specific registers
- Device-mode registers
- Device global registers
- Device endpoint-specific registers
- Power and clock-gating registers
- Data FIFO (DFIFO) access registers

Only the core global, power and clock-gating, data FIFO access, and host port control and status registers can be accessed in both host and device modes. When the OTG controller is operating in one mode, either device or host, the application must not access registers from the other mode. If an illegal access occurs, a mode mismatch interrupt is generated and reflected in the core interrupt register (MMIS bit in the OTG_GINTSTS register). When the core switches from one mode to the other, the registers in the new mode of operation must be reprogrammed as they would be after a power-on reset.

### 60.13.1 CSR memory map

The host and device mode registers occupy different addresses. All registers are implemented in the AHB clock domain.

#### Global CSR map

These registers are available in both host and device modes.

**Table 460. Core global control and status registers (CSRs)**

| Acronym | Address offset | Register name |
|---|---|---|
| OTG_GOTGCTL | 0x000 | *Section 60.14.1: OTG control and status register (OTG_GOTGCTL)* |
| OTG_GOTGINT | 0x004 | *Section 60.14.2: OTG interrupt register (OTG_GOTGINT)* |
| OTG_GAHBCFG | 0x008 | *Section 60.14.3: OTG AHB configuration register (OTG_GAHBCFG)* |

### Data FIFO (DFIFO) access register map

These registers, available in both host and device modes, are used to read or write the FIFO space for a specific endpoint or a channel, in a given direction. If a host channel is of type IN, the FIFO can only be read on the channel. Similarly, if a host channel is of type OUT, the FIFO can only be written on the channel.

**Table 463. Data FIFO (DFIFO) access register map**

| FIFO access register section | Offset address | Access |
|---|---|---|
| Device IN endpoint 0/Host OUT Channel 0: DFIFO write access<br>Device OUT endpoint 0/Host IN Channel 0: DFIFO read access | 0x1000–0x1FFC | w<br>r |
| Device IN endpoint 1/Host OUT Channel 1: DFIFO write access<br>Device OUT endpoint 1/Host IN Channel 1: DFIFO read access | 0x2000–0x2FFC | w<br>r |
| ... | ... | ... |
| Device IN endpoint x(1)/Host OUT Channel x(1): DFIFO write access<br>Device OUT endpoint x(1)/Host IN Channel x(1): DFIFO read access | 0xX000–0xXFFC | w<br>r |

1. Where x is 8in device mode and 15in host mode.

### Power and clock gating CSR map

There is a single register for power and clock gating. It is available in both host and device modes.

**Table 464. Power and clock gating control and status registers**

| Acronym | Offset address | Register name |
|---|---|---|
| OTG_PCGCCTL | 0xE00–0xE04 | *Section 60.14.66: OTG power and clock gating control register (OTG_PCGCCTL)* |

## 60.14 OTG registers

These registers are available in both host and device modes, and do not need to be reprogrammed when switching between these modes.

Bit values in the register descriptions are expressed in binary unless otherwise specified.

### 60.14.1 OTG control and status register (OTG_GOTGCTL)

Address offset: 0x000

Reset value: 0x0001 0000

The OTG_GOTGCTL register controls the behavior and reflects the status of the OTG function of the core.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CUR MOD | OTG VER | BSVLD | ASVLD | DBCT | CID STS |
| | | | | | | | | | | r | rw | r | r | r | r |

| Res. | Res. | Res. | EHEN | DHNP EN | HSHNP EN | HNP RQ | HNG SCS | BVALO VAL | BVALO EN | AVALO VAL | AVALO EN | VBVAL OVAL | VBVAL OEN | SRQ | SRQ SCS |
| | | | rw | rw | rw | rw | r | rw | rw | rw | rw | rw | rw | rw | r |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **CURMOD:** Current mode of operation

Indicates the current mode (host or device).

0: Device mode

1: Host mode

Bit 20 **OTGVER:** OTG version

Selects the OTG revision.

0:OTG Version 1.3. OTG1.3 is obsolete for new product development.

1:OTG Version 2.0. In this version the core supports only data line pulsing for SRP.

Bit 19 **BSVLD:** B-session valid

Indicates the device mode transceiver status.

0: B-session is not valid.

1: B-session is valid.

In OTG mode, the user can use this bit to determine if the device is connected or disconnected.

*Note: Only accessible in device mode.*

Bit 18 **ASVLD:** A-session valid

Indicates the host mode transceiver status.

0: A-session is not valid

1: A-session is valid

*Note: Only accessible in host mode.*

Bit 17 **DBCT:** Long/short debounce time

Indicates the debounce time of a detected connection.

0: Long debounce time, used for physical connections (100 ms + 2.5 µs)

1: Short debounce time, used for soft connections (2.5 µs)

*Note: Only accessible in host mode.*

Bit 16 **CIDSTS:** Connector ID status

Indicates the connector ID status on a connect event.

0: The OTG controller is in A-device mode

1: The OTG controller is in B-device mode

*Note: Accessible in both device and host modes.*

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **EHEN:** Embedded host enable

It is used to select between OTG A device state machine and embedded host state machine.

0: OTG A device state machine is selected

1: Embedded host state machine is selected

Bit 11 **DHNPEN:** Device HNP enabled

The application sets this bit when it successfully receives a SetFeature.SetHNPEnable command from the connected USB host.

0: HNP is not enabled in the application

1: HNP is enabled in the application

*Note: Only accessible in device mode.*

Bit 10 **HSHNPEN:** host set HNP enable

The application sets this bit when it has successfully enabled HNP (using the SetFeature.SetHNPEnable command) on the connected device.

0: Host Set HNP is not enabled

1: Host Set HNP is enabled

*Note: Only accessible in host mode.*

Bit 9 **HNPRQ:** HNP request

The application sets this bit to initiate an HNP request to the connected USB host. The application can clear this bit by writing a 0 when the host negotiation success status change bit in the OTG_GOTGINT register (HNSSCHG bit in OTG_GOTGINT) is set. The core clears this bit when the HNSSCHG bit is cleared.

0: No HNP request

1: HNP request

*Note: Only accessible in device mode.*

Bit 8 **HNGSCS:** Host negotiation success

The core sets this bit when host negotiation is successful. The core clears this bit when the HNP request (HNPRQ) bit in this register is set.

0: Host negotiation failure

1: Host negotiation success

*Note: Only accessible in device mode.*

Bit 7 **BVALOVAL:** B-peripheral session valid override value.

This bit is used to set override value for Bvalid signal when BVALOEN bit is set.

0: Bvalid value is '0' when BVALOEN = 1

1: Bvalid value is '1' when BVALOEN = 1

*Note: Only accessible in device mode.*

Bit 6 **BVALOEN:** B-peripheral session valid override enable.

This bit is used to enable/disable the software to override the Bvalid signal using the BVALOVAL bit.

0:Override is disabled and Bvalid signal from the respective PHY selected is used internally by the core

1:Internally Bvalid received from the PHY is overridden with BVALOVAL bit value

*Note: Only accessible in device mode.*

Bit 5 **AVALOVAL:** A-peripheral session valid override value.

This bit is used to set override value for Avalid signal when AVALOEN bit is set.

0: Avalid value is '0' when AVALOEN = 1

1: Avalid value is '1' when AVALOEN = 1

*Note: Only accessible in host mode.*

Bit 4 **AVALOEN:** A-peripheral session valid override enable.

This bit is used to enable/disable the software to override the Avalid signal using the AVALOVAL bit.

0:Override is disabled and Avalid signal from the respective PHY selected is used internally by the core

1:Internally Avalid received from the PHY is overridden with AVALOVAL bit value

*Note: Only accessible in host mode.*

Bit 3 **VBVALOVAL:** $V_{BUS}$ valid override value.

This bit is used to set override value for vbusvalid signal when VBVALOEN bit is set.

0: vbusvalid value is '0' when VBVALOEN = 1

1: vbusvalid value is '1' when VBVALOEN = 1

*Note: Only accessible in host mode.*

Bit 2 **VBVALOEN:** $V_{BUS}$ valid override enable.

This bit is used to enable/disable the software to override the vbusvalid signal using the VBVALOVAL bit.

0: Override is disabled and vbusvalid signal from the respective PHY selected is used internally by the core

1: Internally vbusvalid received from the PHY is overridden with VBVALOVAL bit value

*Note: Only accessible in host mode.*

Bit 1 **SRQ:** Session request

The application sets this bit to initiate a session request on the USB. The application can clear this bit by writing a 0 when the host negotiation success status change bit in the OTG_GOTGINT register (HNSSCHG bit in OTG_GOTGINT) is set. The core clears this bit when the HNSSCHG bit is cleared.

If the user uses the USB 1.1 full-speed serial transceiver interface to initiate the session request, the application must wait until $V_{BUS}$ discharges to 0.2 V, after the B-session valid bit in this register (BSVLD bit in OTG_GOTGCTL) is cleared.

0: No session request

1: Session request

*Note: Only accessible in device mode.*

Bit 0 **SRQSCS:** Session request success

The core sets this bit when a session request initiation is successful.

0: Session request failure

1: Session request success

*Note: Only accessible in device mode.*

## 60.14.2 OTG interrupt register (OTG_GOTGINT)

Address offset: 0x04

Reset value: 0x0000 0000

The application reads this register whenever there is an OTG interrupt and clears the bits in this register to clear the OTG interrupt.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ID CHNG | DBC DNE | ADTO CHG | HNG DET | Res. |
| | | | | | | | | | | | rc_w1 | rc_w1 | rc_w1 | rc_w1 | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | HNSS CHG | SRSS CHG | Res. | Res. | Res. | Res. | Res. | SEDET | Res. | Res. |
| | | | | | | rc_w1 | rc_w1 | | | | | | rc_w1 | | |

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **IDCHNG**:
This bit when set indicates that there is a change in the value of the ID input pin.

Bit 19 **DBCDNE:** Debounce done
The core sets this bit when the debounce is completed after the device connect. The application can start driving USB reset after seeing this interrupt. This bit is only valid when the HNP Capable or SRP Capable bit is set in the OTG_GUSBCFG register (HNPCAP bit or SRPCAP bit in OTG_GUSBCFG, respectively).
*Note: Only accessible in host mode.*

Bit 18 **ADTOCHG:** A-device timeout change
The core sets this bit to indicate that the A-device has timed out while waiting for the B-device to connect.
*Note: Accessible in both device and host modes.*

Bit 17 **HNGDET:** Host negotiation detected
The core sets this bit when it detects a host negotiation request on the USB.
*Note: Accessible in both device and host modes.*

Bits 16:10 Reserved, must be kept at reset value.

Bit 9 **HNSSCHG:** Host negotiation success status change
The core sets this bit on the success or failure of a USB host negotiation request. The application must read the host negotiation success bit of the OTG_GOTGCTL register (HNGSCS bit in OTG_GOTGCTL) to check for success or failure.
*Note: Accessible in both device and host modes.*

Bits 7:3 Reserved, must be kept at reset value.

Bit 8 **SRSSCHG:** Session request success status change
The core sets this bit on the success or failure of a session request. The application must read the session request success bit in the OTG_GOTGCTL register (SRQSCS bit in OTG_GOTGCTL) to check for success or failure.
*Note: Accessible in both device and host modes.*

Bit 2 **SEDET:** Session end detected
The core sets this bit to indicate that the level of the voltage on $V_{BUS}$ is no longer valid for a B-Peripheral session when $V_{BUS} < 0.8$ V.
*Note: Accessible in both device and host modes.*

Bits 1:0 Reserved, must be kept at reset value.

### 60.14.3 OTG AHB configuration register (OTG_GAHBCFG)

Address offset: 0x008

Reset value: 0x0000 0000

This register can be used to configure the core after power-on or a change in mode. This register mainly contains AHB system-related configuration parameters. Do not change this register after the initial programming. The application must program this register before starting any transactions on either the AHB or the USB.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | PTXFE LVL | TXFE LVL | Res. | DMAEN | HBSTLEN[3:0] | | | | GINT MSK |
| | | | | | | | rw | rw | | rw | rw | rw | rw | rw | rw |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PTXFELVL:** Periodic Tx FIFO empty level

Indicates when the periodic Tx FIFO empty interrupt bit in the OTG_GINTSTS register (PTXFE bit in OTG_GINTSTS) is triggered.

0: PTXFE (in OTG_GINTSTS) interrupt indicates that the Periodic Tx FIFO is half empty

1: PTXFE (in OTG_GINTSTS) interrupt indicates that the Periodic Tx FIFO is completely empty

*Note: Only accessible in host mode.*

Bit 7 **TXFELVL:** Tx FIFO empty level

In device mode, this bit indicates when IN endpoint Transmit FIFO empty interrupt (TXFE in OTG_DIEPINTx) is triggered:

0:The TXFE (in OTG_DIEPINTx) interrupt indicates that the IN endpoint Tx FIFO is half empty

1:The TXFE (in OTG_DIEPINTx) interrupt indicates that the IN endpoint Tx FIFO is completely empty

In host mode, this bit indicates when the nonperiodic Tx FIFO empty interrupt (NPTXFE bit in OTG_GINTSTS) is triggered:

0:The NPTXFE (in OTG_GINTSTS) interrupt indicates that the nonperiodic Tx FIFO is half empty

1:The NPTXFE (in OTG_GINTSTS) interrupt indicates that the nonperiodic Tx FIFO is completely empty

Bit 6 Reserved, must be kept at reset value.

Bit 5 **DMAEN:** DMA enabled

0: The core operates in slave mode

1: The core operates in DMA mode

Bits 4:1 **HBSTLEN[3:0]:** Burst length/type

0000 Single: Bus transactions use single 32 bit accesses (not recommended)

0001 INCR: Bus transactions use unspecified length accesses (not recommended, uses the INCR AHB bus command)

0011 INCR4: Bus transactions target 4x 32 bit accesses

0101 INCR8: Bus transactions target 8x 32 bit accesses

0111 INCR16: Bus transactions based on 16x 32 bit accesses

Others: Reserved

Bit 0 **GINTMSK:** Global interrupt mask

The application uses this bit to mask or unmask the interrupt line assertion to itself. Irrespective of this bit's setting, the interrupt status registers are updated by the core.

0: Mask the interrupt assertion to the application.

1: Unmask the interrupt assertion to the application.

*Note: Accessible in both device and host modes.*

## 60.14.4 OTG USB configuration register (OTG_GUSBCFG)

Address offset: 0x00C

Reset value: 0x0000 1400

This register can be used to configure the core after power-on or a changing to host mode or device mode. It contains USB and USB-PHY related configuration parameters. The application must program this register before starting any transactions on either the AHB or the USB. Do not make changes to this register after the initial programming.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 Reserved, must be kept at reset value.

Bit 30 **FDMOD:** Force device mode

Writing a 1 to this bit, forces the core to device mode irrespective of the OTG_ID input pin.
0: Normal mode
1: Force device mode
After setting the force bit, the application must wait at least 25 ms before the change takes effect.

*Note: Accessible in both device and host modes.*

Bit 29 **FHMOD:** Force host mode

Writing a 1 to this bit, forces the core to host mode irrespective of the OTG_ID input pin.
0: Normal mode
1: Force host mode
After setting the force bit, the application must wait at least 25 ms before the change takes effect.

*Note: Accessible in both device and host modes.*

Bits 28:26 Reserved, must be kept at reset value.

Bits 25:23 Reserved, must be kept at reset value.

Bit 22 **TSDPS**: TermSel DLine pulsing selection

This bit selects utmi_termselect to drive the data line pulse during SRP (session request protocol).
0: Data line pulsing using utmi_txvalid (default)
1: Data line pulsing using utmi_termsel

Bits 21:16 Reserved, must be kept at reset value.

Bit 15 **PHYLPC:** PHY Low-power clock select

This bit selects either 480 MHz or 48 MHz (low-power) PHY mode. In FS and LS modes, the PHY can usually operate on a 48 MHz clock to save power.
0: 480 MHz internal PLL clock
1: 48 MHz external clock
In 480 MHz mode, the UTMI interface operates at either 60 or 30 MHz, depending on whether the 8- or 16-bit data width is selected. In 48 MHz mode, the UTMI interface operates at 48 MHz in FS and LS modes.

Bit 14 Reserved, must be kept at reset value.

Bits 13:10 **TRDT[3:0]:** USB turnaround time

These bits allows to set the turnaround time in PHY clocks. They must be configured according to or *Table 466: TRDT values (HS)*, depending on the application AHB frequency. Higher TRDT values allow stretching the USB response time to IN tokens in order to compensate for longer AHB read access latency to the data FIFO.

*Note: Only accessible in device mode.*

Bit 9 **HNPCAP:** HNP-capable

The application uses this bit to control the OTG controller's HNP capabilities.
0: HNP capability is not enabled.
1: HNP capability is enabled.

*Note: Accessible in both device and host modes.*

Bit 8 **SRPCAP:** SRP-capable

The application uses this bit to control the OTG controller's SRP capabilities. If the core operates as a non-SRP-capable
B-device, it cannot request the connected A-device (host) to activate $V_{BUS}$ and start a session.
0: SRP capability is not enabled.
1: SRP capability is enabled.

*Note: Accessible in both device and host modes.*

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PHYSEL:** Full speed serial transceiver select

0: USB 2.0 internal UTMI high-speed PHY.
1: USB 1.1 full-speed serial transceiver.

Bit 5 Reserved, must be kept at reset value.

Bit 4 Reserved, must be kept at reset value.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **TOCAL[2:0]:** FS timeout calibration

The number of PHY clocks that the application programs in this field is added to the full-speed interpacket timeout duration in the core to account for any additional delays introduced by the PHY. This can be required, because the delay introduced by the PHY in generating the line state condition can vary from one PHY to another.
The USB standard timeout value for full-speed operation is 16 to 18 (inclusive) bit times. The application must program this field based on the speed of enumeration. The number of bit times added per PHY clock is 0.25 bit times.

**Table 465. TRDT values**

| AHB frequency range (MHz) | | TRDT minimum value |
|---|---|---|
| Min | Max | |
| 14.2 | 15 | 0xF |
| 15 | 16 | 0xE |
| 16 | 17.2 | 0xD |
| 17.2 | 18.5 | 0xC |

| 21.8 | 24 | 0x9 |
| 24 | 27.5 | 0x8 |
| 27.5 | 32 | 0x7 |
| 32 | - | 0x6 |

**Table 466. TRDT values (HS)**

| AHB frequency range (MHz) | | TRDT minimum value |
|---|---|---|
| Min | Max | |
| 30 | - | 0x9 |

## 60.14.5 OTG reset register (OTG_GRSTCTL)

Address offset: 0x10

Reset value: 0x8000 0000

The application uses this register to reset various hardware features inside the core.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| AHB IDL | DMAR EQ | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| r | r | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | TXFNUM[4:0] | | | | | TXF FLSH | RXF FLSH | Res. | Res. | PSRST | CSRST |
| | | | | | rw | rw | rw | rw | rw | rs | rs | | | rs | rs |

Bit 31 **AHBIDL:** AHB master idle

Indicates that the AHB master state machine is in the Idle condition.

*Note: Accessible in both device and host modes.*

Bit 30 **DMAREQ:** DMA request signal enabled

This bit indicates that the DMA request is in progress. Used for debug.

Bits 29:11 Reserved, must be kept at reset value.

Bits 10:6 **TXFNUM[4:0]:** Tx FIFO number

This is the FIFO number that must be flushed using the Tx FIFO Flush bit. This field must not be changed until the core clears the Tx FIFO Flush bit.

00000:

- Non-periodic Tx FIFO flush in host mode
- Tx FIFO 0 flush in device mode

00001:

- Periodic Tx FIFO flush in host mode
- Tx FIFO 1 flush in device mode

00010: Tx FIFO 2 flush in device mode

...

01111: Tx FIFO 15 flush in device mode

10000: Flush all the transmit FIFOs in device or host mode.

*Note: Accessible in both device and host modes.*

Bit 5 **TXFFLSH:** Tx FIFO flush

This bit selectively flushes a single or all transmit FIFOs, but cannot do so if the core is in the midst of a transaction.

The application must write this bit only after checking that the core is neither writing to the Tx FIFO nor reading from the Tx FIFO. Verify using these registers:

Read—NAK Effective interrupt ensures the core is not reading from the FIFO

Write—AHBIDL bit in OTG_GRSTCTL ensures the core is not writing anything to the FIFO.

Flushing is normally recommended when FIFOs are reconfigured. FIFO flushing is also recommended during device endpoint disable. The application must wait until the core clears this bit before performing any operations. This bit takes eight clocks to clear, using the slower clock of phy_clk or hclk.

*Note: Accessible in both device and host modes.*

Bit 4 **RXFFLSH:** Rx FIFO flush

The application can flush the entire Rx FIFO using this bit, but must first ensure that the core is not in the middle of a transaction.

The application must only write to this bit after checking that the core is neither reading from the Rx FIFO nor writing to the Rx FIFO.

The application must wait until the bit is cleared before performing any other operations. This bit requires 8 clocks (slowest of PHY or AHB clock) to clear.

*Note: Accessible in both device and host modes.*

Bit 3 Reserved, must be kept at reset value.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **PSRST:** Partial soft reset

Resets the internal state machines but keeps the enumeration info. Could be used to recover some specific PHY errors.

*Note: Accessible in both device and host modes.*

Bit 0 **CSRST:** Core soft reset

Resets the HCLK and PHY clock domains as follows:

Clears the interrupts and all the CSR register bits except for the following bits:

– GATEHCLK bit in OTG_PCGCCTL
– STPPCLK bit in OTG_PCGCCTL
– FSLSPCS bits in OTG_HCFG
– DSPD bit in OTG_DCFG
– SDIS bit in OTG_DCTL
– OTG_GCCFG register

All module state machines (except for the AHB slave unit) are reset to the Idle state, and all the transmit FIFOs and the receive FIFO are flushed.

Any transactions on the AHB Master are terminated as soon as possible, after completing the last data phase of an AHB transfer. Any transactions on the USB are terminated immediately.

The application can write to this bit any time it wants to reset the core. This is a self-clearing bit and the core clears this bit after all the necessary logic is reset in the core, which can take several clocks, depending on the current state of the core. Once this bit has been cleared, the software must wait at least 3 PHY clocks before accessing the PHY domain (synchronization delay). The software must also check that bit 31 in this register is set to 1 (AHB Master is Idle) before starting any operation.

Typically, the software reset is used during software development and also when the user dynamically changes the PHY selection bits in the above listed USB configuration registers. When you change the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain has to be reset for proper operation.

*Note: Accessible in both device and host modes.*

### 60.14.6 OTG core interrupt register (OTG_GINTSTS)

Address offset: 0x014

Reset value: 0x1400 0020

This register interrupts the application for system-level events in the current mode (device mode or host mode).

Some of the bits in this register are valid only in host mode, while others are valid in device mode only. This register also indicates the current mode. To clear the interrupt status bits of the rc_w1 type, the application must write 1 into the bit.

The FIFO status interrupts are read-only; once software reads from or writes to the FIFO while servicing these interrupts, FIFO interrupt conditions are cleared automatically.

The application must clear the OTG_GINTSTS register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 **WKUPINT:** Resume/remote wakeup detected interrupt

Wakeup interrupt during suspend(L2) or LPM(L1) state.

– During suspend(L2):

In device mode, this interrupt is asserted when a resume is detected on the USB. In host mode, this interrupt is asserted when a remote wakeup is detected on the USB.

– During LPM(L1):

This interrupt is asserted for either host initiated resume or device initiated remote wakeup on USB.

*Note: Accessible in both device and host modes.*

Bit 30 **SRQINT:** Session request/new session detected interrupt

In host mode, this interrupt is asserted when a session request is detected from the device. In device mode, this interrupt is asserted when $V_{BUS}$ is in the valid range for a B-peripheral device. Accessible in both device and host modes.

Bit 29 **DISCINT:** Disconnect detected interrupt

Asserted when a device disconnect is detected.

*Note: Only accessible in host mode.*

Bit 28 **CIDSCHG:** Connector ID status change

The core sets this bit when there is a change in connector ID status.

*Note: Accessible in both device and host modes.*

Bit 27 Reserved, must be kept at reset value.

Bit 26 **PTXFE:** Periodic Tx FIFO empty

Asserted when the periodic transmit FIFO is either half or completely empty and there is space for at least one entry to be written in the periodic request queue. The half or completely empty status is determined by the periodic Tx FIFO empty level bit in the OTG_GAHBCFG register (PTXFELVL bit in OTG_GAHBCFG).

*Note: Only accessible in host mode.*

Bit 25 **HCINT:** Host channels interrupt

The core sets this bit to indicate that an interrupt is pending on one of the channels of the core (in host mode). The application must read the OTG_HAINT register to determine the exact number of the channel on which the interrupt occurred, and then read the corresponding OTG_HCINTx register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the OTG_HCINTx register to clear this bit.

*Note: Only accessible in host mode.*

Bit 24 **HPRTINT:** Host port interrupt

The core sets this bit to indicate a change in port status of one of the OTG controller ports in host mode. The application must read the OTG_HPRT register to determine the exact event that caused this interrupt. The application must clear the appropriate status bit in the OTG_HPRT register to clear this bit.

*Note: Only accessible in host mode.*

Bit 23 Reserved, must be kept at reset value.

Bit 22 **DATAFSUSP:** Data fetch suspended

This interrupt is valid only in DMA mode. This interrupt indicates that the core has stopped fetching data for IN endpoints due to the unavailability of TxFIFO space or request queue space. This interrupt is used by the application for an endpoint mismatch algorithm. For example, after detecting an endpoint mismatch, the application:

- Sets a global nonperiodic IN NAK handshake
- Disables IN endpoints
- Flushes the FIFO
- Determines the token sequence from the IN token sequence learning queue
- Re-enables the endpoints

Clears the global nonperiodic IN NAK handshake If the global nonperiodic IN NAK is cleared, the core has not yet fetched data for the IN endpoint, and the IN token is received: the core generates an “IN token received when FIFO empty” interrupt. The OTG then sends a NAK response to the host. To avoid this scenario, the application can check the FetSusp interrupt in OTG_GINTSTS, which ensures that the FIFO is full before clearing a global NAK handshake. Alternatively, the application can mask the “IN token received when FIFO empty” interrupt when clearing a global IN NAK handshake.

Bit 21 **IPXFR:** Incomplete periodic transfer

In host mode, the core sets this interrupt bit when there are incomplete periodic transactions still pending, which are scheduled for the current frame.

**INCOMPISOOUT:** Incomplete isochronous OUT transfer

In device mode, the core sets this interrupt to indicate that there is at least one isochronous OUT endpoint on which the transfer is not completed in the current frame. This interrupt is asserted along with the End of periodic frame interrupt (EOPF) bit in this register.

Bit 20 **IISOIXFR:** Incomplete isochronous IN transfer

The core sets this interrupt to indicate that there is at least one isochronous IN endpoint on which the transfer is not completed in the current frame. This interrupt is asserted along with the End of periodic frame interrupt (EOPF) bit in this register.

*Note: Only accessible in device mode.*

Bit 19 **OEPINT:** OUT endpoint interrupt

The core sets this bit to indicate that an interrupt is pending on one of the OUT endpoints of the core (in device mode). The application must read the OTG_DAINT register to determine the exact number of the OUT endpoint on which the interrupt occurred, and then read the corresponding OTG_DOEPINTx register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding OTG_DOEPINTx register to clear this bit.

*Note: Only accessible in device mode.*

Bit 18 **IEPINT:** IN endpoint interrupt

The core sets this bit to indicate that an interrupt is pending on one of the IN endpoints of the core (in device mode). The application must read the OTG_DAINT register to determine the exact number of the IN endpoint on which the interrupt occurred, and then read the corresponding OTG_DIEPINTx register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding OTG_DIEPINTx register to clear this bit.

*Note: Only accessible in device mode.*

Bits 17:16 Reserved, must be kept at reset value.

Bit 15 **EOPF:** End of periodic frame interrupt

Indicates that the period specified in the periodic frame interval field of the OTG_DCFG register (PFIVL bit in OTG_DCFG) has been reached in the current frame.

*Note: Only accessible in device mode.*

Bit 14 **ISOODRP:** Isochronous OUT packet dropped interrupt

The core sets this bit when it fails to write an isochronous OUT packet into the Rx FIFO because the Rx FIFO does not have enough space to accommodate a maximum size packet for the isochronous OUT endpoint.

*Note: Only accessible in device mode.*

Bit 13 **ENUMDNE:** Enumeration done

The core sets this bit to indicate that speed enumeration is complete. The application must read the OTG_DSTS register to obtain the enumerated speed.

*Note: Only accessible in device mode.*

Bit 12 **USBRST:** USB reset

The core sets this bit to indicate that a reset is detected on the USB.

*Note: Only accessible in device mode.*

Bit 11 **USBSUSP:** USB suspend

The core sets this bit to indicate that a suspend was detected on the USB. The core enters the suspended state when there is no activity on the data lines for an extended period of time.

*Note: Only accessible in device mode.*

Bit 10 **ESUSP:** Early suspend

The core sets this bit to indicate that an Idle state has been detected on the USB for 3 ms.

*Note: Only accessible in device mode.*

Bits 9:8 Reserved, must be kept at reset value.

Bit 7 **GONAKEFF:** Global OUT NAK effective

Indicates that the Set global OUT NAK bit in the OTG_DCTL register (SGONAK bit in OTG_DCTL), set by the application, has taken effect in the core. This bit can be cleared by writing the Clear global OUT NAK bit in the OTG_DCTL register (CGONAK bit in OTG_DCTL).

*Note: Only accessible in device mode.*

Bit 6 **GINAKEFF:** Global IN non-periodic NAK effective

Indicates that the Set global non-periodic IN NAK bit in the OTG_DCTL register (SGINAK bit in OTG_DCTL), set by the application, has taken effect in the core. That is, the core has sampled the Global IN NAK bit set by the application. This bit can be cleared by clearing the Clear global non-periodic IN NAK bit in the OTG_DCTL register (CGINAK bit in OTG_DCTL).

This interrupt does not necessarily mean that a NAK handshake is sent out on the USB. The STALL bit takes precedence over the NAK bit.

*Note: Only accessible in device mode.*

Bit 5 **NPTXFE:** Non-periodic Tx FIFO empty

This interrupt is asserted when the non-periodic Tx FIFO is either half or completely empty, and there is space for at least one entry to be written to the non-periodic transmit request queue. The half or completely empty status is determined by the non-periodic Tx FIFO empty level bit in the OTG_GAHBCFG register (TXFELVL bit in OTG_GAHBCFG).

*Note: Accessible in host mode only.*

Bit 4 **RXFLVL:** Rx FIFO non-empty

Indicates that there is at least one packet pending to be read from the Rx FIFO.

*Note: Accessible in both host and device modes.*

Bit 3 **SOF:** Start of frame

In host mode, the core sets this bit to indicate that an SOF (FS), or Keep-Alive (LS) is transmitted on the USB. The application must write a 1 to this bit to clear the interrupt.

In device mode, in the core sets this bit to indicate that an SOF token has been received on the USB. The application can read the OTG_DSTS register to get the current frame number. This interrupt is seen only when the core is operating in FS.

*Note: This register may return '1' if read immediately after power on reset. If the register bit reads '1' immediately after power on reset it does not indicate that an SOF has been sent (in case of host mode) or SOF has been received (in case of device mode). The read value of this interrupt is valid only after a valid connection between host and device is established. If the bit is set after power on reset the application can clear the bit.*

*Note: Accessible in both host and device modes.*

Bit 2 **OTGINT:** OTG interrupt

The core sets this bit to indicate an OTG protocol event. The application must read the OTG interrupt status (OTG_GOTGINT) register to determine the exact event that caused this interrupt. The application must clear the appropriate status bit in the OTG_GOTGINT register to clear this bit.

*Note: Accessible in both host and device modes.*

Bit 1 **MMIS:** Mode mismatch interrupt

The core sets this bit when the application is trying to access:

– A host mode register, when the core is operating in device mode

– A device mode register, when the core is operating in host mode

The register access is completed on the AHB with an OKAY response, but is ignored by the core internally and does not affect the operation of the core.

*Note: Accessible in both host and device modes.*

Bit 0 **CMOD:** Current mode of operation

Indicates the current mode.

0: Device mode

1: Host mode

*Note: Accessible in both host and device modes.*

### 60.14.7 OTG interrupt mask register (OTG_GINTMSK)

Address offset: 0x018

Reset value: 0x0000 0000

This register works with the core interrupt register to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the core interrupt (OTG_GINTSTS) register bit corresponding to that interrupt is still set.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 60.14.8 OTG receive status debug read register (OTG_GRXSTSR)

Address offset for read: 0x01C

Reset value: 0x0000 0000

This description is for register OTG_GRXSTSR in Device mode.

A read to the receive status debug read register returns the contents of the top of the receive FIFO.

The core ignores the receive status read when the receive FIFO is empty and returns a value of 0x0000 0000.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **STSPHST:** Status phase start

Indicates the start of the status phase for a control write transfer. This bit is set along with the OUT transfer completed PKTSTS pattern.

Bits 26:25 Reserved, must be kept at reset value.

Bits 24:21 **FRMNUM[3:0]:** Frame number

This is the least significant 4 bits of the frame number in which the packet is received on the USB. This field is supported only when isochronous OUT endpoints are supported.

Bits 20:17 **PKTSTS[3:0]:** Packet status

Indicates the status of the received packet
0001: Global OUT NAK (triggers an interrupt)
0010: OUT data packet received
0011: OUT transfer completed (triggers an interrupt)
0100: SETUP transaction completed (triggers an interrupt)
0110: SETUP data packet received
Others: Reserved

Bits 16:15 **DPID[1:0]:** Data PID

Indicates the data PID of the received OUT data packet
00: DATA0
10: DATA1
01: DATA2
11: MDATA

Bits 14:4 **BCNT[10:0]:** Byte count

Indicates the byte count of the received data packet.

Bits 3:0 **EPNUM[3:0]:** Endpoint number

Indicates the endpoint number to which the current received packet belongs.

### 60.14.9 OTG receive status debug read [alternate] (OTG_GRXSTSR)

Address offset for read: 0x01C

Reset value: 0x0000 0000

This description is for register OTG_GRXSTSR in Host mode.

A read to the receive status debug read register returns the contents of the top of the receive FIFO.

The core ignores the receive status read when the receive FIFO is empty and returns a value of 0x0000 0000.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:17 **PKTSTS[3:0]:** Packet status
Indicates the status of the received packet
0010: IN data packet received
0011: IN transfer completed (triggers an interrupt)
0101: Data toggle error (triggers an interrupt)
0111: Channel halted (triggers an interrupt)
Others: Reserved

Bits 16:15 **DPID[1:0]:** Data PID
Indicates the data PID of the received packet
00: DATA0
10: DATA1
01: DATA2
11: MDATA

Bits 14:4 **BCNT[10:0]:** Byte count
Indicates the byte count of the received IN data packet.

Bits 3:0 **CHNUM[3:0]:** Channel number
Indicates the channel number to which the current received packet belongs.

### 60.14.10 OTG status read and pop registers (OTG_GRXSTSP)

Address offset for pop: 0x020

Reset value: 0x0000 0000

This description is for register OTG_GRXSTSP in Device mode.

Similarly to OTG_GRXSTSR (receive status debug read register) where a read returns the contents of the top of the receive FIFO, a read to OTG_GRXSTSP (receive status read and pop register) additionally pops the top data entry out of the Rx FIFO.

The core ignores the receive status pop/read when the receive FIFO is empty and returns a value of 0x0000 0000. The application must only pop the receive status FIFO when the receive FIFO non-empty bit of the core interrupt register (RXFLVL bit in OTG_GINTSTS) is asserted.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **STSPHST:** Status phase start

Indicates the start of the status phase for a control write transfer. This bit is set along with the OUT transfer completed PKTSTS pattern.

Bits 26:25 Reserved, must be kept at reset value.

Bits 24:21 **FRMNUM[3:0]:** Frame number

This is the least significant 4 bits of the frame number in which the packet is received on the USB. This field is supported only when isochronous OUT endpoints are supported.

Bits 20:17 **PKTSTS[3:0]:** Packet status

Indicates the status of the received packet
0001: Global OUT NAK (triggers an interrupt)
0010: OUT data packet received
0011: OUT transfer completed (triggers an interrupt)
0100: SETUP transaction completed (triggers an interrupt)
0110: SETUP data packet received
Others: Reserved

Bits 16:15 **DPID[1:0]:** Data PID
Indicates the data PID of the received OUT data packet
00: DATA0
10: DATA1
01: DATA2
11: MDATA

Bits 14:4 **BCNT[10:0]:** Byte count
Indicates the byte count of the received data packet.

Bits 3:0 **EPNUM[3:0]:** Endpoint number
Indicates the endpoint number to which the current received packet belongs.

### 60.14.11 OTG status read and pop registers [alternate] (OTG_GRXSTSP)

Address offset for pop: 0x020

Reset value: 0x0000 0000

This description is for register OTG_GRXSTSP in Host mode.

Similarly to OTG_GRXSTSR (receive status debug read register) where a read returns the contents of the top of the receive FIFO, a read to OTG_GRXSTSP (receive status read and pop register) additionally pops the top data entry out of the Rx FIFO.

The core ignores the receive status pop/read when the receive FIFO is empty and returns a value of 0x0000 0000. The application must only pop the receive status FIFO when the receive FIFO non-empty bit of the core interrupt register (RXFLVL bit in OTG_GINTSTS) is asserted.

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:17 **PKTSTS[3:0]:** Packet status
Indicates the status of the received packet
0010: IN data packet received
0011: IN transfer completed (triggers an interrupt)
0101: Data toggle error (triggers an interrupt)
0111: Channel halted (triggers an interrupt)
Others: Reserved

Bits 16:15 **DPID[1:0]:** Data PID
Indicates the data PID of the received packet
00: DATA0
10: DATA1
01: DATA2
11: MDATA

Bits 14:4 **BCNT[10:0]:** Byte count
Indicates the byte count of the received IN data packet.

Bits 3:0 **CHNUM[3:0]:** Channel number
Indicates the channel number to which the current received packet belongs.

## 60.14.12 OTG receive FIFO size register (OTG_GRXFSIZ)

Address offset: 0x024

Reset value: 0x0000 0400

The application can program the RAM size that must be allocated to the Rx FIFO.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| RXFD[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RXFD[15:0]:** Rx FIFO depth
This value is in terms of 32-bit words.
Maximum value is 1024
Programmed values must respect the available FIFO memory allocation and must not exceed the power-on value.

## 60.14.13 OTG host non-periodic transmit FIFO size register (OTG_HNPTXFSIZ)/Endpoint 0 Transmit FIFO size (OTG_DIEPTXF0)

Address offset: 0x028

Reset value: 0x0200 0200

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

### Host mode

Bits 31:16 **NPTXFD[15:0]:** Non-periodic Tx FIFO depth
This value is in terms of 32-bit words.
Minimum value is 16
Programmed values must respect the available FIFO memory allocation and must not exceed the power-on value.

Bits 15:0 **NPTXFSA[15:0]:** Non-periodic transmit RAM start address
This field configures the memory start address for non-periodic transmit FIFO RAM.

### Device mode

Bits 31:16 **TX0FD:** Endpoint 0 Tx FIFO depth
This value is in terms of 32-bit words.
Minimum value is 16
Programmed values must respect the available FIFO memory allocation and must not exceed the power-on value.

Bits 15:0 **TX0FSA:** Endpoint 0 transmit RAM start address
This field configures the memory start address for the endpoint 0 transmit FIFO RAM.

## 60.14.14 OTG non-periodic transmit FIFO/queue status register (OTG_HNPTXSTS)

Address offset: 0x02C

Reset value: 0x0008 0400

*Note: In device mode, this register is not valid.*

This read-only register contains the free space information for the non-periodic Tx FIFO and the non-periodic transmit request queue.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | NPTXQTOP[6:0] | | | | | | | NPTQXSAV[7:0] | | | | | | | |
| | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

| NPTXFSAV[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **NPTXQTOP[6:0]:** Top of the non-periodic transmit request queue

Entry in the non-periodic Tx request queue that is currently being processed by the MAC.
Bits 30:27: Channel/endpoint number
Bits 26:25:
00: IN/OUT token
01: Zero-length transmit packet (device IN/host OUT)
11: Channel halt command
Bit 24: Terminate (last entry for selected channel/endpoint)

Bits 23:16 **NPTQXSAV[7:0]:** Non-periodic transmit request queue space available

Indicates the amount of free space available in the non-periodic transmit request queue. This queue holds both IN and OUT requests.
0: Non-periodic transmit request queue is full
1: 1 location available
2: locations available
n: n locations available (0 ≤ n ≤ 8)
Others: Reserved

Bits 15:0 **NPTXFSAV[15:0]:** Non-periodic Tx FIFO space available

Indicates the amount of free space available in the non-periodic Tx FIFO.
Values are in terms of 32-bit words.
0: Non-periodic Tx FIFO is full
1: 1 word available
2: 2 words available
n: n words available (where 0 ≤ n ≤ 512)
Others: Reserved

### 60.14.15 OTG general core configuration register (OTG_GCCFG)

Address offset: 0x038

Reset value: 0x0000 XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | IDEN | VBDEN | SDEN | PDEN | Res. | BCDEN | PWR DWN |
| | | | | | | | | | rw | rw | rw | rw | | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PS2 DET | SDET | PDET | Res. |
| | | | | | | | | | | | | r | r | r | |

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **IDEN**: USB ID detection enable

Enables detection of the ID pin state.

0: Disable ID pin state detection

1: Enable ID pin state detection

Bit 21 **VBDEN:** USB $V_{BUS}$ detection enable

Enables $V_{BUS}$ sensing comparators to detect $V_{BUS}$ valid levels on the $V_{BUS}$ PAD for USB host and device operation. If HNP and/or SRP support is enabled, $V_{BUS}$ comparators are automatically enabled independently of VBDEN value.

0 = $V_{BUS}$ detection disabled

1 = $V_{BUS}$ detection enabled

Bit 20 **SDEN:** Secondary detection (SD) mode enable

This bit is set by the software to put the BCD into SD mode. Only one detection mode (PD, SD or OFF) should be selected to work correctly

Bit 19 **PDEN:** Primary detection (PD) mode enable

This bit is set by the software to put the BCD into PD mode. Only one detection mode (PD, SD or OFF) should be selected to work correctly.

Bit 18 Reserved, must be kept at reset value.

Bit 17 **BCDEN:** Battery charging detector (BCD) enable

This bit is set by the software to enable the BCD support within the USB device. When enabled, the USB PHY is fully controlled by BCD and cannot be used for normal communication. Once the BCD discovery is finished, the BCD should be placed in OFF mode by clearing this bit to ‘0’ in order to allow the normal USB operation.

Bit 16 **PWRDWN:** Power down control

Used to activate the transceiver in transmission/reception. When reset, the transceiver is kept in power-down. When set, the BCD function must be off (BCDEN=0).

0 = USB FS transceiver disabled

1 = USB FS transceiver enabled

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PS2DET:** DM pull-up detection status

This bit is active only during PD and gives the result of comparison between DM voltage level and VLGC threshold. In normal situation, the DM level should be below this threshold. If it is above, it means that the DM is externally pulled high. This can be caused by connection to a PS2 port (which pulls-up both DP and DM lines) or to some proprietary charger not following the BCD specification.

0: Normal port detected (connected to SDP, CDP or DCP)

1: PS2 port or proprietary charger detected

Bit 2 **SDET:** Secondary detection (SD) status

This bit gives the result of SD.

0: CDP detected

1: DCP detected

Bit 1 **PDET:** Primary detection (PD) status

This bit gives the result of PD.

0: no BCD support detected (connected to SDP or proprietary device).

1: BCD support detected (connected to CDP or DCP).

Bit 0 Reserved, must be kept at reset value.

### 60.14.16 OTG core ID register (OTG_CID)

Address offset: 0x03C

Reset value: 0x0000 4000

This is a register containing the Product ID as reset value.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PRODUCT_ID[31:16] | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | EN BESL | LPMRCNTSTS[2:0] | | | SND LPM | LPMRCNT[2:0] | | | LPMCHIDX[3:0] | | | | L1RSM OK |
| | | | rw | r | r | r | rs | rw | rw | rw | rw | rw | rw | rw | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SLP STS | LPMRSP[1:0] | | L1DS EN | BESLTHRS[3:0] | | | | L1SS EN | REM WAKE | BESL[3:0] | | | | LPM ACK | LPM EN |
| r | r | r | rw | rw | rw | rw | rw | rw | rw/r | rw/r | rw/r | rw/r | rw/r | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **ENBESL:** Enable best effort service latency
This bit enables the BESL feature as defined in the LPM errata:
0:The core works as described in the following document:
*USB 2.0 Link Power Management Addendum Engineering Change Notice to the USB 2.0 specification, July 16, 2007*
1:The core works as described in the LPM Errata:
*Errata for USB 2.0 ECN: Link Power Management (LPM) - 7/2007*
*Note: Only the updated behavior (described in LPM Errata) is considered in this document and so the ENBESL bit should be set to '1' by application SW.*

Bits 27:25 **LPMRCNTSTS[2:0]:** LPM retry count status
Number of LPM host retries still remaining to be transmitted for the current LPM sequence.
*Note: Accessible only in host mode.*

Bit 24 **SNDLPM:** Send LPM transaction

When the application software sets this bit, an LPM transaction containing two tokens, EXT and LPM is sent. The hardware clears this bit once a valid response (STALL, NYET, or ACK) is received from the device or the core has finished transmitting the programmed number of LPM retries.

*Note: This bit must be set only when the host is connected to a local port.*

*Note: Accessible only in host mode.*

Bits 23:21 **LPMRCNT[2:0]:** LPM retry count

When the device gives an ERROR response, this is the number of additional LPM retries that the host performs until a valid device response (STALL, NYET, or ACK) is received.

*Note: Accessible only in host mode.*

Bits 20:17 **LPMCHIDX[3:0]:** LPM Channel Index

The channel number on which the LPM transaction has to be applied while sending an LPM transaction to the local device. Based on the LPM channel index, the core automatically inserts the device address and endpoint number programmed in the corresponding channel into the LPM transaction.

*Note: Accessible only in host mode.*

Bit 16 **L1RSMOK:** Sleep state resume OK

Indicates that the device or host can start resume from Sleep state. This bit is valid in LPM sleep (L1) state. It is set in sleep mode after a delay of 50 µs ($T_{L1Residency}$).

This bit is reset when SLPSTS is 0.

1: The application or host can start resume from Sleep state

0: The application or host cannot start resume from Sleep state

Bit 15 **SLPSTS:** Port sleep status

**Device mode**:

This bit is set as long as a Sleep condition is present on the USB bus. The core enters the Sleep state when an ACK response is sent to an LPM transaction and the $T_{L1TokenRetry}$ timer has expired. To stop the PHY clock, the application must set the STPPCLK bit in OTG_PCGCCTL, which asserts the PHY suspend input signal.

The application must rely on SLPSTS and not ACK in LPMRSP to confirm transition into sleep.

The core comes out of sleep:

– When there is any activity on the USB linestate

– When the application writes to the RWUSIG bit in OTG_DCTL or when the application resets or soft-disconnects the device.

**Host mode**:

The host transitions to Sleep (L1) state as a side-effect of a successful LPM transaction by the core to the local port with ACK response from the device. The read value of this bit reflects the current Sleep status of the port.

The core clears this bit after:

– The core detects a remote L1 wakeup signal,

– The application sets the PRST bit or the PRES bit in the OTG_HPRT register, or

– The application sets the L1Resume/ remote wakeup detected interrupt bit or disconnect detected interrupt bit in the core interrupt register (WKUPINT or DISCINT bit in OTG_GINTSTS, respectively).

0: Core not in L1

1: Core in L1

Bits 14:13 **LPMRSP[1:0]:** LPM response

**Device mode**:
The response of the core to LPM transaction received is reflected in these two bits.
**Host mode**:
Handshake response received from local device for LPM transaction
11: ACK
10: NYET
01: STALL
00: ERROR (No handshake response)

Bit 12 **L1DSEN:** L1 deep sleep enable

Enables suspending the PHY in L1 Sleep mode. For maximum power saving during L1 Sleep mode, this bit should be set to '1' by application SW in all the cases.

Bits 11:8 **BESLTHRS[3:0]:** BESL threshold

**Device mode**:
The core puts the PHY into deep low power mode in L1 when BESL value is greater than or equal to the value defined in this field BESL_Thres[3:0].
**Host mode**:
The core puts the PHY into deep low power mode in L1. BESLTHRS[3:0] specifies the time for which resume signaling is to be reflected by host ($T_{L1HubDrvResume2}$) on the USB bus when it detects device initiated resume.
BESLTHRS must not be programmed with a value greater than 1100b in host mode, because this exceeds maximum $T_{L1HubDrvResume2}$.
Thres[3:0] host mode resume signaling time (µs):
0000: 75
0001: 100
0010: 150
0011: 250
0100: 350
0101: 450
0110: 950
All other values: reserved

Bit 7 **L1SSEN:** L1 Shallow Sleep enable

Enables suspending the PHY in L1 Sleep mode. For maximum power saving during L1 Sleep mode, this bit should be set to '1' by application SW in all the cases.

Bit 6 **REMWAKE:** bRemoteWake value

**Host mode**:
The value of remote wake up to be sent in the wIndex field of LPM transaction.
**Device mode (read-only)**:
This field is updated with the received LPM token bRemoteWake bmAttribute when an ACK, NYET, or STALL response is sent to an LPM transaction.

Bits 5:2 **BESL[3:0]:** Best effort service latency

**Host mode**:

The value of BESL to be sent in an LPM transaction. This value is also used to initiate resume for a duration $T_{L1HubDrvResume1}$ for host initiated resume.

**Device mode (read-only)**:

This field is updated with the received LPM token BESL bmAttribute when an ACK, NYET, or STALL response is sent to an LPM transaction.

BESL[3:0]$T_{BESL}$ (µs)

0000: 125
0001: 150
0010: 200
0011: 300
0100: 400
0101: 500
0110: 1000
0111: 2000
1000: 3000
1001: 4000
1010: 5000
1011: 6000
1100: 7000
1101: 8000
1110: 9000
1111: 10000

Bit 1 **LPMACK:** LPM token acknowledge enable

Handshake response to LPM token preprogrammed by device application software.

1: ACK

Even though ACK is preprogrammed, the core device responds with ACK only on successful LPM transaction. The LPM transaction is successful if:

– No PID/CRC5 errors in either EXT token or LPM token (else ERROR)
– Valid bLinkState = 0001B (L1) received in LPM transaction (else STALL)
– No data pending in transmit queue (else NYET).

0: NYET

The preprogrammed software bit is over-ridden for response to LPM token when:

– The received bLinkState is not L1 (STALL response), or
– An error is detected in either of the LPM token packets because of corruption (ERROR response).

*Note: Accessible only in device mode.*

Bit 0 **LPMEN:** LPM support enable

The application uses this bit to control the OTG core LPM capabilities.

If the core operates as a non-LPM-capable host, it cannot request the connected device or hub to activate LPM mode.

If the core operates as a non-LPM-capable device, it cannot respond to any LPM transactions.

0: LPM capability is not enabled
1: LPM capability is enabled

### 60.14.18 OTG host periodic transmit FIFO size register (OTG_HPTXFSIZ)

Address offset: 0x100

Reset value: 0x0200 0400

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PTXFSIZ[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PTXSA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **PTXFSIZ[15:0]:** Host periodic Tx FIFO depth
This value is in terms of 32-bit words.
Minimum value is 16

Bits 15:0 **PTXSA[15:0]:** Host periodic Tx FIFO start address
This field configures the memory start address for periodic transmit FIFO RAM.

### 60.14.19 OTG device IN endpoint transmit FIFO x size register (OTG_DIEPTXFx)

Address offset: 0x104 + 0x04 * (x - 1), (x = 1 to 8)

Reset value: Block 1: 0x0200 0400

Reset value: Block 2: 0x0200 0600

Reset value: Block 3: 0x0200 0800

Reset value: Block 4: 0x0200 0A00

Reset value: Block 5: 0x0200 0C00

Reset value: Block 6: 0x0200 0E00

Reset value: Block 7: 0x0200 1000

Reset value: Block 8: 0x0200 1200

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| INEPTXFD[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| INEPTXSA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **INEPTXFD[15:0]:** IN endpoint Tx FIFO depth
This value is in terms of 32-bit words.
Minimum value is 16

Bits 15:0 **INEPTXSA[15:0]:** IN endpoint FIFOx transmit RAM start address
This field contains the memory start address for IN endpoint transmit FIFOx. The address must be aligned with a 32-bit memory location.

## 60.14.20 Host-mode registers

Bit values in the register descriptions are expressed in binary unless otherwise specified.

Host-mode registers affect the operation of the core in the host mode. Host mode registers must not be accessed in device mode, as the results are undefined. Host mode registers can be categorized as follows:

## 60.14.21 OTG host configuration register (OTG_HCFG)

Address offset: 0x400

Reset value: 0x0000 0000

This register configures the core after power-on. Do not make changes to this register after initializing the host.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | PERSSCHEDENA | FRLSTEN[1:0] | | DESCDMA | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | rw | rw | rw | rw | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FSLSS | FSLSPCS[1:0] | |
| | | | | | | | | | | | | | r | rw | rw |

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **PERSSCHEDENA**: Enable periodic scheduling
Applicable in host scatter/gather DMA mode only. Enables periodic scheduling within the core. Initially, the bit is res and the core does not process any periodic channels. As soon as this bit is set, the core gets ready to start scheduling periodic channels and sets OTG_HCFG.PERSCHEDSTAT. The setting of PERSCHEDSTAT indicates the core has enabled periodic scheduling. Once PERSSCHEDENA is set, the application is not supposed to reset the bit unless PERSCHEDSTAT is set. As soon as this bit is reset, the core gets ready to stop scheduling periodic channels and resets HCFG. PerSchedStat. In non-Scatter/Gather DMA mode, this bit is reserved.

Bits 25:24 **FRLSTEN[1:0]**: Frame list entries
The value in the register specifies the number of entries in the Frame list. This field is valid only in Scatter/Gather DMA mode.
2'b00: Reserved
2'b01: 8 Entries
2'b10: 16 Entries
2'b11: 32 Entries In non-Scatter/Gather

Bit 23 **DESCDMA**: Enable scatter/gather DMA in host mode

The application can set this bit during initialization to enable the Scatter/Gather DMA operation. This bit must be modified only once after a reset. The following combinations are available for programming:
OTG_GAHBCFG.DMAEN=0,OTG_HCFG.DESCDMA=0 => Slave mode
OTG_GAHBCFG.DMAEN=0,OTG_HCFG.DESCDMA=1 => Invalid
OTG_GAHBCFG.DMAEN=1,OTG_HCFG.DESCDMA=0 => Buffered DMA mode
OTG_GAHBCFG.DMAEN=1,OTG_HCFG.DESCDMA=1 => Scatter/Gather DMA mode

Bits 22:3 Reserved, must be kept at reset value.

Bit 2 **FSLSS:** FS- and LS-only support

The application uses this bit to control the core's enumeration speed. Using this bit, the application can make the core enumerate as an FS host, even if the connected device supports HS traffic. Do not make changes to this field after initial programming.

Bits 1:0 **FSLSPCS[1:0]:** FS/LS PHY clock select

When the core is in FS host mode
01: PHY clock is running at 48 MHz
Others: Reserved
When the core is in LS host mode
00: Reserved
01: Select 48 MHz PHY clock frequency
10: Select 6 MHz PHY clock frequency
11: Reserved

*Note: The FSLSPCS must be set on a connection event according to the speed of the connected device (after changing this bit, a software reset must be performed).*

## 60.14.22 OTG host frame interval register (OTG_HFIR)

Address offset: 0x404

Reset value: 0x0000 EA60

This register stores the frame interval information for the current speed to which the OTG controller has enumerated.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RLD CTRL |
| | | | | | | | | | | | | | | | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FRIVL[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **RLDCTRL:** Reload control

This bit allows dynamic reloading of the HFIR register during run time.

0: The HFIR can be dynamically reloaded during run time.

1: The HFIR cannot be reloaded dynamically

This bit needs to be programmed during initial configuration and its value must not be changed during run time.

**Caution:** RLDCTRL = 1 is not recommended.

Bits 15:0 **FRIVL[15:0]:** Frame interval

The value that the application programs to this field, specifies the interval between two consecutive micro-SOFs (HS) or Keep-Alive tokens (LS). This field contains the number of PHY clocks that constitute the required frame interval. The application can write a value to this register only after the port enable bit of the host port control and status register (PENA bit in OTG_HPRT) has been set. If no value is programmed, the core calculates the value based on the PHY clock specified in the FS/LS PHY clock select field of the host configuration register (FSLSPCS in OTG_HCFG). Do not change the value of this field after the initial configuration, unless the RLDCTRL bit is set. In such case, the FRIVL is reloaded with each SOF event.

– Frame interval = 125 µs × (FRIVL - 1) in high speed operation (PHYSEL = 0)

– Frame interval = 1 ms × (FRIVL - 1) in low/full speed operation (PHYSEL = 1)

## 60.14.23 OTG host frame number/frame time remaining register (OTG_HFNUM)

Address offset: 0x408

Reset value: 0x0000 3FFF

This register indicates the current frame number. It also indicates the time remaining (in terms of the number of PHY clocks) in the current frame.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FTREM[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| FRNUM[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 **FTREM[15:0]:** Frame time remaining

Indicates the amount of time remaining in the current frame, in terms of PHY clocks. This field decrements on each PHY clock. When it reaches zero, this field is reloaded with the value in the Frame interval register and a new SOF is transmitted on the USB.

Bits 15:0 **FRNUM[15:0]:** Frame number

This field increments when a new SOF is transmitted on the USB, and is cleared to 0 when it reaches 0x3FFF.

### 60.14.24 OTG_Host periodic transmit FIFO/queue status register (OTG_HPTXSTS)

Address offset: 0x410

Reset value: 0x0008 0100

This read-only register contains the free space information for the periodic Tx FIFO and the periodic transmit request queue.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PTXQTOP[7:0] | | | | | | | | PTXQSAV[7:0] | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PTXFSAVL[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:24 **PTXQTOP[7:0]:** Top of the periodic transmit request queue

This indicates the entry in the periodic Tx request queue that is currently being processed by the MAC.

This register is used for debugging.

Bit 31: Odd/Even frame

0: send in even frame

1: send in odd frame

Bits 30:27: Channel/endpoint number

Bits 26:25: Type

00: IN/OUT

01: Zero-length packet

11: Disable channel command

Bit 24: Terminate (last entry for the selected channel/endpoint)

Bits 23:16 **PTXQSAV[7:0]:** Periodic transmit request queue space available

Indicates the number of free locations available to be written in the periodic transmit request queue. This queue holds both IN and OUT requests.

00: Periodic transmit request queue is full

01: 1 location available

10: 2 locations available

bxn: n locations available (0 ≤ n ≤ 8)

Others: Reserved

Bits 15:0 **PTXFSAVL[15:0]:** Periodic transmit data FIFO space available

Indicates the number of free locations available to be written to in the periodic Tx FIFO.

Values are in terms of 32-bit words

0000: Periodic Tx FIFO is full

0001: 1 word available

0010: 2 words available

bxn: n words available (where 0 ≤ n ≤ PTXFD)

Others: Reserved

### 60.14.25 OTG host all channels interrupt register (OTG_HAINT)

Address offset: 0x414

Reset value: 0x0000 0000

When a significant event occurs on a channel, the host all channels interrupt register interrupts the application using the host channels interrupt bit of the core interrupt register (HCINT bit in OTG_GINTSTS). This is shown in *Figure 745*. There is one interrupt bit per channel, up to a maximum of 16 bits. Bits in this register are set and cleared when the application sets and clears bits in the corresponding host channel-x interrupt register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| HAINT[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **HAINT[15:0]:** Channel interrupts
One bit per channel: Bit 0 for Channel 0, bit 15 for Channel 15

### 60.14.26 OTG host all channels interrupt mask register (OTG_HAINTMSK)

Address offset: 0x418

Reset value: 0x0000 0000

The host all channel interrupt mask register works with the host all channel interrupt register to interrupt the application when an event occurs on a channel. There is one interrupt mask bit per channel, up to a maximum of 16 bits.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| HAINTM[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **HAINTM[15:0]:** Channel interrupt mask
0: Masked interrupt
1: Unmasked interrupt
One bit per channel: Bit 0 for channel 0, bit 15 for channel 15

### 60.14.27 OTG host frame list base address register (OTG_HFLBADDR)

Address offset: 0x41C

Reset value: 0x0000 0000

This register holds the starting address of the frame list information (scatter/gather mode).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| HFLBADDR[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HFLBADDR[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **HFLBADDR[31:0]**: The starting address of the frame list (scatter/gather mode).
This register is used only for isochronous and interrupt channels.

### 60.14.28 OTG host port control and status register (OTG_HPRT)

Address offset: 0x440

Reset value: 0x0000 0000

This register is available only in host mode. Currently, the OTG host supports only one port.

A single register holds USB port-related information such as USB reset, enable, suspend, resume, connect status, and test mode for each port. It is shown in *Figure 745*. The rc_w1 bits in this register can trigger an interrupt to the application through the host port interrupt bit of the core interrupt register (HPRTINT bit in OTG_GINTSTS). On a port interrupt, the application must read this register and clear the bit that caused the interrupt. For the rc_w1 bits, the application must write a 1 to the bit to clear the interrupt.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PSPD[1:0] | | PTCTL[3] |
| | | | | | | | | | | | | | r | r | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PTCTL[2:0] | | | PPWR | PLSTS[1:0] | | Res. | PRST | PSUSP | PRES | POC CHNG | POCA | PEN CHNG | PENA | PCDET | PCSTS |
| rw | rw | rw | rw | r | r | | rw | rs | rw | rc_w1 | r | rc_w1 | rc_w1 | rc_w1 | r |

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:17 **PSPD[1:0]:** Port speed

Indicates the speed of the device attached to this port.
01: Full speed
10: Low speed
11: Reserved
00: High speed

Bits 16:13 **PTCTL[3:0]:** Port test control

The application writes a nonzero value to this field to put the port into a Test mode, and the corresponding pattern is signaled on the port.
0000: Test mode disabled
0001: Test_J mode
0010: Test_K mode
0011: Test_SE0_NAK mode
0100: Test_Packet mode
0101: Test_Force_Enable
Others: Reserved

Bit 12 **PPWR:** Port power

The application uses this field to control power to this port, and the core clears this bit on an overcurrent condition.
0: Power off
1: Power on

Bits 11:10 **PLSTS[1:0]:** Port line status

Indicates the current logic level USB data lines
Bit 10: Logic level of OTG_DP
Bit 11: Logic level of OTG_DM

Bit 9 Reserved, must be kept at reset value.

Bit 8 **PRST:** Port reset

When the application sets this bit, a reset sequence is started on this port. The application must time the reset period and clear this bit after the reset sequence is complete.
0: Port not in reset
1: Port in reset
The application must leave this bit set for a minimum duration of at least 10 ms to start a reset on the port. The application can leave it set for another 10 ms in addition to the required minimum duration, before clearing the bit, even though there is no maximum limit set by the USB standard.
High speed: 50 ms
Full speed/Low speed: 10 ms

Bit 7 **PSUSP:** Port suspend

The application sets this bit to put this port in suspend mode. The core only stops sending SOFs when this is set. To stop the PHY clock, the application must set the port clock stop bit, which asserts the suspend input pin of the PHY.
The read value of this bit reflects the current suspend status of the port. This bit is cleared by the core after a remote wakeup signal is detected or the application sets the port reset bit or port resume bit in this register or the resume/remote wakeup detected interrupt bit or disconnect detected interrupt bit in the core interrupt register (WKUPINT or DISCINT in OTG_GINTSTS, respectively).
0: Port not in suspend mode
1: Port in suspend mode

Bit 6 **PRES:** Port resume

The application sets this bit to drive resume signaling on the port. The core continues to drive the resume signal until the application clears this bit.

If the core detects a USB remote wakeup sequence, as indicated by the port resume/remote wakeup detected interrupt bit of the core interrupt register (WKUPINT bit in OTG_GINTSTS), the core starts driving resume signaling without application intervention and clears this bit when it detects a disconnect condition. The read value of this bit indicates whether the core is currently driving resume signaling.

0: No resume driven

1: Resume driven

When LPM is enabled and the core is in L1 state, the behavior of this bit is as follow:

1. The application sets this bit to drive resume signaling on the port.

2. The core continues to drive the resume signal until a predetermined time specified in BESLTHRS[3:0] field of OTG_GLPMCFG register.

3. If the core detects a USB remote wakeup sequence, as indicated by the port L1Resume/Remote L1Wakeup detected interrupt bit of the core interrupt register (WKUPINT in OTG_GINTSTS), the core starts driving resume signaling without application intervention and clears this bit at the end of resume.This bit can be set or cleared by both the core and the application. This bit is cleared by the core even if there is no device connected to the host.

Bit 5 **POCCHNG:** Port overcurrent change

The core sets this bit when the status of the port overcurrent active bit (bit 4) in this register changes.

Bit 4 **POCA:** Port overcurrent active

Indicates the overcurrent condition of the port.

0: No overcurrent condition

1: Overcurrent condition

Bit 3 **PENCHNG:** Port enable/disable change

The core sets this bit when the status of the port enable bit 2 in this register changes.

Bit 2 **PENA:** Port enable

A port is enabled only by the core after a reset sequence, and is disabled by an overcurrent condition, a disconnect condition, or by the application clearing this bit. The application cannot set this bit by a register write. It can only clear it to disable the port. This bit does not trigger any interrupt to the application.

0: Port disabled

1: Port enabled

Bit 1 **PCDET:** Port connect detected

The core sets this bit when a device connection is detected to trigger an interrupt to the application using the host port interrupt bit in the core interrupt register (HPRTINT bit in OTG_GINTSTS). The application must write a 1 to this bit to clear the interrupt.

Bit 0 **PCSTS:** Port connect status

0: No device is attached to the port

1: A device is attached to the port

### 60.14.29 OTG host channel x characteristics register (OTG_HCCHARx)

Address offset: 0x500 + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CHENA | CHDIS | Res. | DAD[6:0] | | | | | | | MCNT[1:0] | | EPTYP[1:0] | | LSDEV | Res. |
| rs | rs | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **CHENA:** Channel enable

When Scatter/Gather mode is enabled:

1'b0: Indicates that the descriptor structure is not yet ready

1'b1: Indicates that the descriptor structure and data buffer with data is setup and this channel can access the descriptor

When Scatter/Gather mode is disabled: This field is set by the application and cleared by the OTG host.

0: Channel disabled
1: Channel enabled

Bit 30 **CHDIS:** Channel disable

The application sets this bit to stop transmitting/receiving data on a channel, even before the transfer for that channel is complete. The application must wait for the Channel disabled interrupt before treating the channel as disabled.

Bit 29 Reserved, must be kept at reset value.

Bits 28:22 **DAD[6:0]:** Device address

This field selects the specific device serving as the data source or sink.

Bits 21:20 **MCNT[1:0]:** Multicount

This field indicates to the host the number of transactions that must be executed per frame for this periodic endpoint. For non-periodic transfers, this field is not used

00: Reserved. This field yields undefined results
01: 1 transaction
10: 2 transactions per frame to be issued for this endpoint
11: 3 transactions per frame to be issued for this endpoint

*Note: This field must be set to at least 01.*

Bits 19:18 **EPTYP[1:0]:** Endpoint type

Indicates the transfer type selected.

00: Control
01: Isochronous
10: Bulk
11: Interrupt

Bit 17 **LSDEV:** Low-speed device

This field is set by the application to indicate that this channel is communicating to a low-speed device.

Bit 16 Reserved, must be kept at reset value.

Bit 15 **EPDIR:** Endpoint direction
Indicates whether the transaction is IN or OUT.
0: OUT
1: IN

Bits 14:11 **EPNUM[3:0]:** Endpoint number
Indicates the endpoint number on the device serving as the data source or sink.

Bits 10:0 **MPSIZ[10:0]:** Maximum packet size
Indicates the maximum packet size of the associated endpoint.

## 60.14.30 OTG host channel x split control register (OTG_HCSPLTx)

Address offset: 0x504 + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **SPLITEN:** Split enable
The application sets this bit to indicate that this channel is enabled to perform split transactions.

Bits 30:17 Reserved, must be kept at reset value.

Bit 16 **COMPLSPLT:** Do complete split
The application sets this bit to request the OTG host to perform a complete split transaction.

Bits 15:14 **XACTPOS[1:0]:** Transaction position
This field is used to determine whether to send all, first, middle, or last payloads with each OUT transaction.
11: All. This is the entire data payload of this transaction (which is less than or equal to 188 bytes)
10: Begin. This is the first data payload of this transaction (which is larger than 188 bytes)
00: Mid. This is the middle payload of this transaction (which is larger than 188 bytes)
01: End. This is the last payload of this transaction (which is larger than 188 bytes)

Bits 13:7 **HUBADDR[6:0]:** Hub address
This field holds the device address of the transaction translator's hub.

Bits 6:0 **PRTADDR[6:0]:** Port address
This field is the port number of the recipient transaction translator.

### 60.14.31 OTG host channel x interrupt register (OTG_HCINTx)

Address offset: 0x508 + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in *Figure 745*. The application must read this register when the host channels interrupt bit in the core interrupt register (HCINT bit in OTG_GINTSTS) is set. Before the application can read this register, it must first read the host all channels interrupt (OTG_HAINT) register to get the exact channel number for the host channel-x interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG_HAINT and OTG_GINTSTS registers.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | DESCLSTROLL | XCSXACTERR | BNA | DTERR | FRMOR | BBERR | TXERR | NYET | ACK | NAK | STALL | AHBERR | CHH | XFRC |
| | | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **DESCLSTROLL:** Descriptor rollover interrupt.
This bit is valid only when Scatter/Gather DMA mode is enabled. The core sets this bit when the corresponding channel descriptor list rolls over. For non Scatter/Gather DMA mode, this bit is reserved.

Bit 12 **XCSXACTERR:** Excessive transaction error.
This bit is valid only when Scatter/Gather DMA mode is enabled. The core sets this bit when 3 consecutive transaction errors occurred on the USB bus. XCS_XACT_ERR is not generated for isochronous channels. For non Scatter/Gather DMA mode, this bit is reserved.

Bit 11 **BNA:** Buffer not available interrupt.
This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the core to process. BNA interrupt is not generated for isochronous channels. For non Scatter/Gather DMA mode, this bit is reserved.

Bit 10 **DTERR:** Data toggle error. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 9 **FRMOR:** Frame overrun. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 8 **BBERR:** Babble error. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 7 **TXERR:** Transaction error. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
Indicates one of the following errors occurred on the USB.
CRC check failure
Timeout
Bit stuff error
False EOP

Bit 6 **NYET:** Not yet ready response received interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 5 **ACK:** ACK response received/transmitted interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 4 **NAK:** NAK response received interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 3 **STALL:** STALL response received interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 2 **AHBERR:** AHB error

This error is generated only in Internal DMA mode when an AHB error occurs during an AHB read/write operation. The application can read the corresponding DMA channel address register to get the error address.

Bit 1 **CHH:** Channel halted.

In non scatter/gather DMA mode indicates the transfer completed abnormally either because of any USB transaction error or in response to disable request by the application. In scatter/gather DMA mode, this indicates that transfer completed due to any of the following:

– EOL being set in descriptor
– AHB error
– Excessive transaction errors
– In response to disable request by the application
– Babble
– Stall

Bit 0 **XFRC:** Transfer completed.

Transfer completed normally without any errors.

## 60.14.32 OTG host channel x interrupt mask register (OTG_HCINTMSKx)

Address offset: 0x50C + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

This register reflects the mask for each channel status described in the previous section.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **DESCLSTROLLMSK:** Descriptor rollover interrupt mask register.
This bit is valid only when Scatter/Gather DMA mode is enabled.
In non Scatter/Gather DMA mode, this bit is reserved.

Bit 12 Reserved, must be kept at reset value.

Bit 11 **BNAMSK:** Buffer not available interrupt mask register.
This bit is valid only when Scatter/Gather DMA mode is enabled.
In non Scatter/Gather DMA mode, this bit is reserved

Bit 10 **DTERRM:** Data toggle error mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 9 **FRMORM:** Frame overrun mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 8 **BBERRM:** Babble error mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 7 **TXERRM:** Transaction error mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 6 **NYET:** response received interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 5 **ACKM:** ACK response received/transmitted interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 4 **NAKM:** NAK response received interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 3 **STALLM:** STALL response received interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
0: Masked interrupt
1: Unmasked interrupt

Bit 2 **AHBERRM:** AHB error. In scatter/gather DMA mode for host, interrupts will not be generated due to the corresponding bits set in OTG_HCINTx.
0: Masked interrupt
1: Unmasked interrupt

Bit 1 **CHHM:** Channel halted mask
0: Masked interrupt
1: Unmasked interrupt

Bit 0 **XFRCM:** Transfer completed mask
0: Masked interrupt
1: Unmasked interrupt

## 60.14.33 OTG host channel x transfer size register (OTG_HCTSIZx)

Address offset: 0x510 + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | DPID[1:0] | | PKTCNT[9:0] | | | | | | | | | | XFRSIZ[18:16] | | |
| | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| XFRSIZ[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **DPID[1:0]:** Data PID
The application programs this field with the type of PID to use for the initial transaction. The host maintains this field for the rest of the transfer.
00: DATA0
01: DATA2
10: DATA1
11: SETUP (control) / MDATA (non-control)

Bits 28:19 **PKTCNT[9:0]:** Packet count
This field is programmed by the application with the expected number of packets to be transmitted (OUT) or received (IN).
The host decrements this count on every successful transmission or reception of an OUT/IN packet. Once this count reaches zero, the application is interrupted to indicate normal completion.

Bits 18:0 **XFRSIZ[18:0]:** Transfer size
For an OUT, this field is the number of data bytes the host sends during the transfer.
For an IN, this field is the buffer size that the application has reserved for the transfer. The application is expected to program this field as an integer multiple of the maximum packet size for IN transactions (periodic and non-periodic).

### 60.14.34 OTG host channel x transfer size register (OTG_HCTSIZSGx)

Address offset: 0x510 + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DO PNG | PID[1:0] | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw | rw | rw | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NTD[7:0] | | | | | | | | SCHED_INFO[7:0] | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **DOPNG:** Do Ping

This bit is used only for OUT transfers. Setting this field to 1 directs the host to do PING protocol.

*Note: Do not set this bit for IN transfers. If this bit is set for IN transfers, it disables the channel.*

Bits 30:29 **PID[1:0]:** Pid

The application programs this field with the type of PID to use for the initial transaction. The host maintains this field for the rest of the transfer.

00: DATA0

01: DATA2

10: DATA1

11: MDATA (non-control) / SETUP (control)

Bits 28:16 Reserved, must be kept at reset value.

Bits 15:8 **NTD[7:0]:** Number of transfer descriptors

Non isochronous: this value is in terms of number of descriptors. The maximum number of descriptor that can be present in the list is 64. The values can be from 0 to 63.
0: 1 descriptor
1: 2 descriptors
...
63: 64 descriptors
Others: Reserved
This field indicates the total number of descriptors present in that list. The core will wrap around after servicing NTD number of descriptors for that list.

Isochronous: this field indicates the number of descriptors present in that list.
The possible values for FS are:
1: 2 descriptors
3: 4 descriptors
7: 8 descriptors
15: 16 descriptors
31: 32 descriptors
63: 64: descriptors
Others: Reserved
The possible values for HS are:
7: 8 descriptors
15: 16 descriptors
31: 32 descriptors
63: 64 descriptors
127: 128 descriptors
255: 256 descriptors
Others: Reserved

Bits 7:0 **SCHED_INFO[7:0]**: Schedule information
Every bit in this 8 bit register indicates scheduling for that microframe. Bit 0 indicates scheduling for 1st microframe and bit 7 indicates scheduling for 8th microframe in that frame. A value of 0b11111111 indicates that the corresponding interrupt channel is scheduled to issue a token every microframe in that frame. A value of 0b10101010 indicates that the corresponding interrupt channel is scheduled to issue a token every alternate microframe starting with second microframe. Note that this field is applicable only for periodic (isochronous and interrupt) channels.

### 60.14.35 OTG host channel x DMA address register in buffer DMA [alternate] (OTG_HCDMAx)

Address offset: 0x514 + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DMAADDR[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DMAADDR[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DMAADDR[31:0]:** DMA address

This field holds the start address in the external memory from which the data for the endpoint must be fetched or to which it must be stored. This register is incremented on every AHB transaction.

### 60.14.36 OTG host channel x DMA address register in scatter/gather DMA [alternate] (OTG_HCDMASGx)

Address offset: 0x514 + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DMASG[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DMASG[15:3] | | | | | | | | | | | | | Res. | Res. | Res. |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | |

Bits 31:3 **DMASG[31:3]:** DMA scatter/gather information

The DMASG information is composed of two parts DMASG_ADDR = DMASG[31:N] and DMASG_CTD = DAMSG[N-1:3].

Non-isochronous case (N = 9):

The DAMSG_ADDR field holds the start address of the 512 bytes page. The first descriptor in the list should be located in this address. The first descriptor may be or may not be ready. The core starts processing the list from the CTD value.

The DMASG_CTD field holds a value in terms of number of descriptors. The values can be from 0 (1 descriptor) to 63 (64 descriptors). This field indicates the current descriptor processed in the list. This field is updated both by application and the core. For example, if the application enables the channel after programming CTD = 5, then the core will start processing the 6th descriptor. The address is obtained by adding a value of 8 * 5 = 40 bytes (decimal) to DMAAddr.

Isochronous case (N=4 to 11):

The DAMSG_ADDR field holds the address of the 2*(NTD+1) bytes of locations in which the isochronous descriptors are present where N is based on NTD as per the following table:

| | |
|---|---|
| HS ISOC; NTD = 7: | N = 6 |
| HS ISOC; NTD = 15: | N = 7 |
| HS ISOC; NTD = 31: | N = 8 |
| HS ISOC; NTD = 63: | N = 9 |
| HS ISOC; NTD = 127: | N = 10 |
| HS ISOC; NTD = 255: | N = 11 |
| FS ISOC; NTD = 1: | N = 4 |
| FS ISOC; NTD = 3: | N = 5 |
| FS ISOC; NTD = 7: | N = 6 |
| FS ISOC; NTD = 15: | N = 7 |
| FS ISOC; NTD = 31: | N = 8 |
| FS ISOC; NTD = 63: | N = 9 |

The DMASG_CTD field is based on the current frame/(micro)frame value. Need to be set to zero by application.

Bits 2:0 Reserved, must be kept at reset value.

## 60.14.37 OTG host channel-n DMA address buffer register (OTG_HCDMABx)

Address offset: 0x51C + 0x20 * x, (x = 0 to 15)

Reset value: 0x0000 0000 (0x0000 0000)

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| HCDMAB[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HCDMAB[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **HCDMAB[31:0]:** DMA address

This register holds the current buffer address (scatter/gather mode).

## 60.14.38 Device-mode registers

These registers must be programmed every time the core changes to device mode

## 60.14.39 OTG device configuration register (OTG_DCFG)

Address offset: 0x800

Reset value: 0x0220 0000

This register configures the core in device mode after power-on or after certain control commands or enumeration. Do not make changes to this register after initial programming.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | PERSCHIVL[1:0] | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | rw | rw | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ERRATIM | XCVRDLY | Res. | PFIVL[1:0] | | DAD[6:0] | | | | | | | Res. | NZLSOHSK | DSPD[1:0] | |
| rw | rw | | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **PERSCHIVL[1:0]:** Periodic schedule interval

This field specifies the amount of time the Internal DMA engine must allocate for fetching periodic IN endpoint data. Based on the number of periodic endpoints, this value must be specified as 25, 50 or 75% of the (micro) frame.

- When any periodic endpoints are active, the internal DMA engine allocates the specified amount of time in fetching periodic IN endpoint data
- When no periodic endpoint is active, then the internal DMA engine services nonperiodic endpoints, ignoring this field
- After the specified time within a (micro) frame, the DMA switches to fetching nonperiodic endpoints

00: 25% of (micro)frame
01: 50% of (micro)frame
10: 75% of (micro)frame
11: Reserved

Bits 23:16 Reserved, must be kept at reset value.

Bit 15 **ERRATIM:** Erratic error interrupt mask

1: Mask early suspend interrupt on erratic error
0: Early suspend interrupt is generated on erratic error

Bit 14 Reserved, must be kept at reset value.

Bit 13 Reserved, must be kept at reset value.

Bits 12:11 **PFIVL[1:0]:** Periodic frame interval

Indicates the time within a frame at which the application must be notified using the end of periodic frame interrupt. This can be used to determine if all the isochronous traffic for that frame is complete.

00: 80% of the frame interval

01: 85% of the frame interval

10: 90% of the frame interval

11: 95% of the frame interval

Bits 10:4 **DAD[6:0]:** Device address

The application must program this field after every SetAddress control command.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **NZLSOHSK:** Non-zero-length status OUT handshake

The application can use this field to select the handshake the core sends on receiving a nonzero-length data packet during the OUT transaction of a control transfer's status stage.

1:Send a STALL handshake on a nonzero-length status OUT transaction and do not send the received OUT packet to the application.

0:Send the received OUT packet to the application (zero-length or nonzero-length) and send a handshake based on the NAK and STALL bits for the endpoint in the device endpoint control register.

Bits 1:0 **DSPD[1:0]:** Device speed

Indicates the speed at which the application requires the core to enumerate, or the maximum speed the application can support. However, the actual bus speed is determined only after the chirp sequence is completed, and is based on the speed of the USB host to which the core is connected.

00: High speed

01: Full speed using HS

11: Full speed using internal FS PHY

## 60.14.40 OTG device control register (OTG_DCTL)

Address offset: 0x804

Reset value: 0x0000 0002

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DS BESL RJCT | Res. | Res. |
| | | | | | | | | | | | | | rw | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | PO PRG DNE | CGO NAK | SGO NAK | CGI NAK | SGI NAK | TCTL[2:0] | | | GON STS | GIN STS | SDIS | RWU SIG |
| | | | | rw | w | w | w | w | rw | rw | rw | r | r | rw | rw |

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **DSBESLRJCT:** Deep sleep BESL reject

Core rejects LPM request with BESL value greater than BESL threshold programmed. NYET response is sent for LPM tokens with BESL value greater than BESL threshold. By default, the deep sleep BESL reject feature is disabled.

Bits 17:12 Reserved, must be kept at reset value.

Bit 11 **POPRGDNE:** Power-on programming done

The application uses this bit to indicate that register programming is completed after a wakeup from power down mode.

Bit 10 **CGONAK:** Clear global OUT NAK

Writing 1 to this field clears the Global OUT NAK.

Bit 9 **SGONAK:** Set global OUT NAK

Writing 1 to this field sets the Global OUT NAK.
The application uses this bit to send a NAK handshake on all OUT endpoints.
The application must set the this bit only after making sure that the Global OUT NAK effective bit in the core interrupt register (GONAKEFF bit in OTG_GINTSTS) is cleared.

Bit 8 **CGINAK:** Clear global IN NAK

Writing 1 to this field clears the Global IN NAK.

Bit 7 **SGINAK:** Set global IN NAK

Writing 1 to this field sets the Global non-periodic IN NAK.The application uses this bit to send a NAK handshake on all non-periodic IN endpoints.
The application must set this bit only after making sure that the Global IN NAK effective bit in the core interrupt register (GINAKEFF bit in OTG_GINTSTS) is cleared.

Bits 6:4 **TCTL[2:0]:** Test control

000: Test mode disabled
001: Test_J mode
010: Test_K mode
011: Test_SE0_NAK mode
100: Test_Packet mode
101: Test_Force_Enable
Others: Reserved

Bit 3 **GONSTS:** Global OUT NAK status

0:A handshake is sent based on the FIFO status and the NAK and STALL bit settings.
1:No data is written to the Rx FIFO, irrespective of space availability. Sends a NAK handshake on all packets, except on SETUP transactions. All isochronous OUT packets are dropped.

Bit 2 **GINSTS:** Global IN NAK status

0:A handshake is sent out based on the data availability in the transmit FIFO.

1:A NAK handshake is sent out on all non-periodic IN endpoints, irrespective of the data availability in the transmit FIFO.

Bit 1 **SDIS:** Soft disconnect

The application uses this bit to signal the USB OTG core to perform a soft disconnect. As long as this bit is set, the host does not see that the device is connected, and the device does not receive signals on the USB. The core stays in the disconnected state until the application clears this bit.

0:Normal operation. When this bit is cleared after a soft disconnect, the core generates a device connect event to the USB host. When the device is reconnected, the USB host restarts device enumeration.

1:The core generates a device disconnect event to the USB host.

Bit 0 **RWUSIG:** Remote wakeup signaling

When the application sets this bit, the core initiates remote signaling to wake up the USB host. The application must set this bit to instruct the core to exit the suspend state. As specified in the USB 2.0 specification, the application must clear this bit 1 ms to 15 ms after setting it.

If LPM is enabled and the core is in the L1 (sleep) state, when the application sets this bit, the core initiates L1 remote signaling to wake up the USB host. The application must set this bit to instruct the core to exit the sleep state. As specified in the LPM specification, the hardware automatically clears this bit 50 µs ($T_{L1DevDrvResume}$) after being set by the application. The application must not set this bit when bRemoteWake from the previous LPM transaction is zero (refer to REMWAKE bit in GLPMCFG register).

*Table 467* contains the minimum duration (according to device state) for which the Soft disconnect (SDIS) bit must be set for the USB host to detect a device disconnect. To accommodate clock jitter, it is recommended that the application add some extra delay to the specified minimum duration.

**Table 467. Minimum duration for soft disconnect**

| Operating speed | Device state | Minimum duration |
|---|---|---|
| Full speed | Suspended | 1 ms + 2.5 µs |
| Full speed | Idle | 2.5 µs |
| Full speed | Not Idle or suspended (Performing transactions) | 2.5 µs |
| High speed | Not Idle or suspended (Performing transactions) | 125 µs |

### 60.14.41 OTG device status register (OTG_DSTS)

Address offset: 0x808

Reset value: 0x0000 0010

This register indicates the status of the core with respect to USB-related events. It must be read on interrupts from the device all interrupts (OTG_DAINT) register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DEVLNSTS[1:0] | | FNSOF[13:8] | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| FNSOF[7:0] | | | | | | | | Res. | Res. | Res. | Res. | EERR | ENUMSPD[1:0] | | SUSP STS |
| r | r | r | r | r | r | r | r | | | | | r | r | r | r |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **DEVLNSTS[1:0]:** Device line status

Indicates the current logic level USB data lines.
Bit [23]: Logic level of D+
Bit [22]: Logic level of D-

Bits 21:8 **FNSOF[13:0]:** Frame number of the received SOF

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **EERR:** Erratic error

The core sets this bit to report any erratic errors.
Due to erratic errors, the OTG controller goes into suspended state and an interrupt is generated to the application with Early suspend bit of the OTG_GINTSTS register (ESUSP bit in OTG_GINTSTS). If the early suspend is asserted due to an erratic error, the application can only perform a soft disconnect recover.

Bits 2:1 **ENUMSPD[1:0]:** Enumerated speed

Indicates the speed at which the OTG controller has come up after speed detection through a chirp sequence.
01: Reserved
10: Reserved
11: Full speed (PHY clock is running at 48 MHz)
Others: reserved

Bit 0 **SUSPSTS:** Suspend status

In device mode, this bit is set as long as a suspend condition is detected on the USB. The core enters the suspended state when there is no activity on the USB data lines for a period of 3 ms. The core comes out of the suspend:

– When there is an activity on the USB data lines
– When the application writes to the remote wakeup signaling bit in the OTG_DCTL register (RWUSIG bit in OTG_DCTL).

### 60.14.42 OTG device IN endpoint common interrupt mask register (OTG_DIEPMSK)

Address offset: 0x810

Reset value: 0x0000 0000

This register works with each of the OTG_DIEPINTx registers for all endpoints to generate an interrupt per IN endpoint. The IN endpoint interrupt for a specific status in the OTG_DIEPINTx register can be masked by writing to the corresponding bit in this register. Status bits are masked by default.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| | | rw | | | | rw | rw | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **NAKM:** NAK interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bits 12:10 Reserved, must be kept at reset value.

Bit 9 **BNAM:** BNA interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bit 8 **TXFURM:** FIFO underrun mask
0: Masked interrupt
1: Unmasked interrupt

Bit 7 Reserved, must be kept at reset value.

Bit 6 **INEPNEM:** IN endpoint NAK effective mask
0: Masked interrupt
1: Unmasked interrupt

Bit 5 **INEPNMM:** IN token received with EP mismatch mask
0: Masked interrupt
1: Unmasked interrupt

Bit 4 **ITTXFEMSK:** IN token received when Tx FIFO empty mask
0: Masked interrupt
1: Unmasked interrupt

Bit 3 **TOM:** Timeout condition mask (Non-isochronous endpoints)
0: Masked interrupt
1: Unmasked interrupt

Bit 2 **AHBERRM:** AHB error mask
0: Masked interrupt
1: Unmasked interrupt

Bit 1 **EPDM:** Endpoint disabled interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bit 0 **XFRCM:** Transfer completed interrupt mask
0: Masked interrupt
1: Unmasked interrupt

### 60.14.43 OTG device OUT endpoint common interrupt mask register (OTG_DOEPMSK)

Address offset: 0x814

Reset value: 0x0000 0000

This register works with each of the OTG_DOEPINTx registers for all endpoints to generate an interrupt per OUT endpoint. The OUT endpoint interrupt for a specific status in the OTG_DOEPINTx register can be masked by writing into the corresponding bit in this register. Status bits are masked by default.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | rw | rw | rw | | | rw | rw | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **NYETMSK:** NYET interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bit 13 **NAKMSK:** NAK interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bit 12 **BERRM**: Babble error interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **BNAM:** BNA interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bit 8 **OUTPKTERRM:** Out packet error mask
0: Masked interrupt
1: Unmasked interrupt

Bit 7 Reserved, must be kept at reset value.

Bit 6 **B2BSTUPM:** Back-to-back SETUP packets received mask
Applies to control OUT endpoints only.
0: Masked interrupt
1: Unmasked interrupt

Bit 5 **STSPHSRXM**: Status phase received for control write mask
0: Masked interrupt
1: Unmasked interrupt

Bit 4 **OTEPDM:** OUT token received when endpoint disabled mask. Applies to control OUT endpoints only.
0: Masked interrupt
1: Unmasked interrupt

Bit 3 **STUPM:** STUPM: SETUP phase done mask. Applies to control endpoints only.
0: Masked interrupt
1: Unmasked interrupt

Bit 2 **AHBERRM:** AHB error mask
0: Masked interrupt
1: Unmasked interrupt

Bit 1 **EPDM:** Endpoint disabled interrupt mask
0: Masked interrupt
1: Unmasked interrupt

Bit 0 **XFRCM:** Transfer completed interrupt mask
0: Masked interrupt
1: Unmasked interrupt

### 60.14.44 OTG device all endpoints interrupt register (OTG_DAINT)

Address offset: 0x818

Reset value: 0x0000 0000

When a significant event occurs on an endpoint, a OTG_DAINT register interrupts the application using the device OUT endpoints interrupt bit or device IN endpoints interrupt bit of the OTG_GINTSTS register (OEPINT or IEPINT in OTG_GINTSTS, respectively). There is one interrupt bit per endpoint, up to a maximum of 16 bits for OUT endpoints and 16 bits for IN endpoints. For a bidirectional endpoint, the corresponding IN and OUT interrupt bits are used. Bits in this register are set and cleared when the application sets and clears bits in the corresponding device endpoint-x interrupt register (OTG_DIEPINTx/OTG_DOEPINTx).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| OEPINT[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IEPINT[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 **OEPINT[15:0]:** OUT endpoint interrupt bits
One bit per OUT endpoint:
Bit 16 for OUT endpoint 0, bit 19 for OUT endpoint 3.

Bits 15:0 **IEPINT[15:0]:** IN endpoint interrupt bits
One bit per IN endpoint:
Bit 0 for IN endpoint 0, bit 3 for endpoint 3.

### 60.14.45 OTG all endpoints interrupt mask register (OTG_DAINTMSK)

Address offset: 0x81C

Reset value: 0x0000 0000

The OTG_DAINTMSK register works with the device endpoint interrupt register to interrupt the application when an event occurs on a device endpoint. However, the OTG_DAINT register bit corresponding to that interrupt is still set.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:16 **OEPM[15:0]:** OUT EP interrupt mask bits
One per OUT endpoint:
Bit 16 for OUT EP 0, bit 19 for OUT EP 3
0: Masked interrupt
1: Unmasked interrupt

Bits 15:0 **IEPM[15:0]:** IN EP interrupt mask bits
One bit per IN endpoint:
Bit 0 for IN EP 0, bit 3 for IN EP 3
0: Masked interrupt
1: Unmasked interrupt

### 60.14.46 OTG device $V_{BUS}$ discharge time register (OTG_DVBUSDIS)

Address offset: 0x0828

Reset value: 0x0000 17D7

This register specifies the $V_{BUS}$ discharge time after $V_{BUS}$ pulsing during SRP.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VBUSDT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **VBUSDT[15:0]:** Device $V_{BUS}$ discharge time
Specifies the $V_{BUS}$ discharge time after $V_{BUS}$ pulsing during SRP. This value equals:
$V_{BUS}$ discharge time in PHY clocks / 1 024
Depending on your $V_{BUS}$ load, this value may need adjusting.

### 60.14.47 OTG device $V_{BUS}$ pulsing time register (OTG_DVBUSPULSE)

Address offset: 0x082C

Reset value: 0x0000 05B8

This register specifies the $V_{BUS}$ pulsing time during SRP.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DVBUSP[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **DVBUSP[15:0]:** Device $V_{BUS}$ pulsing time. This feature is only relevant to OTG1.3.
Specifies the $V_{BUS}$ pulsing time during SRP. This value equals:
$V_{BUS}$ pulsing time in PHY clocks / 1 024

### 60.14.48 OTG device threshold control register (OTG_DTHRCTL)

Address offset: 0x0830

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | ARPEN | Res. | RXTHRLEN[8:0] | | | | | | | | | RXTHREN |
| | | | | rw | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | TXTHRLEN[8:0] | | | | | | | | | ISOTHREN | NONISOTHREN |
| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **ARPEN:** Arbiter parking enable

This bit controls internal DMA arbiter parking for IN endpoints. When thresholding is enabled and this bit is set to one, then the arbiter parks on the IN endpoint for which there is a token received on the USB. This is done to avoid getting into underrun conditions. By default parking is enabled.

Bit 26 Reserved, must be kept at reset value.

Bits 25:17 **RXTHRLEN[8:0]:** Receive threshold length

This field specifies the receive thresholding size in 32-bit words. This field also specifies the amount of data received on the USB before the core can start transmitting on the AHB. The threshold length has to be at least eight 32-bit words. The recommended value for RXTHRLEN is to be the same as the programmed AHB burst length (HBSTLEN bit in OTG_GAHBCFG).

Bit 16 **RXTHREN:** Receive threshold enable

When this bit is set, the core enables thresholding in the receive direction.

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:2 **TXTHRLEN[8:0]:** Transmit threshold length

This field specifies the transmit thresholding size in 32-bit words. This field specifies the amount of data in bytes to be in the corresponding endpoint transmit FIFO, before the core can start transmitting on the USB. The threshold length has to be at least eight 32-bit words. This field controls both isochronous and nonisochronous IN endpoint thresholds. The recommended value for TXTHRLEN is to be the same as the programmed AHB burst length (HBSTLEN bit in OTG_GAHBCFG).

Bit 1 **ISOTHREN:** ISO IN endpoint threshold enable

When this bit is set, the core enables thresholding for isochronous IN endpoints.

Bit 0 **NONISOTHREN:** Nonisochronous IN endpoints threshold enable

When this bit is set, the core enables thresholding for nonisochronous IN endpoints.

### 60.14.49 OTG device IN endpoint FIFO empty interrupt mask register (OTG_DIEPEMPMSK)

Address offset: 0x834

Reset value: 0x0000 0000

This register is used to control the IN endpoint FIFO empty interrupt generation (TXFE_OTG_DIEPINTx).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| INEPTXFEM[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INEPTXFEM[15:0]:** IN EP Tx FIFO empty interrupt mask bits
These bits act as mask bits for OTG_DIEPINTx.
TXFE interrupt one bit per IN endpoint:
Bit 0 for IN endpoint 0, bit 3 for IN endpoint 3
0: Masked interrupt
1: Unmasked interrupt

### 60.14.50 OTG device each endpoint interrupt register (OTG_DEACHINT)

Address offset: 0x0838

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | r | |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **OEP1INT:** OUT endpoint 1 interrupt bit

Bits 16:2 Reserved, must be kept at reset value.

Bit 1 **IEP1INT:** IN endpoint 1interrupt bit

Bit 0 Reserved, must be kept at reset value.

### 60.14.51 OTG device each endpoint interrupt mask register (OTG_DEACHINTMSK)

Address offset: 0x083C

Reset value: 0x0000 0000

There is one interrupt bit for endpoint 1 IN and one interrupt bit for endpoint 1 OUT.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OEP1INTM | Res. |
| | | | | | | | | | | | | | | rw | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | | | | | | | | | | | | | | rw | |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **OEP1INTM:** OUT endpoint 1 interrupt mask bit

Bits 16:2 Reserved, must be kept at reset value.

Bit 1 **IEP1INTM:** IN endpoint 1 interrupt mask bit

Bit 0 Reserved, must be kept at reset value.

### 60.14.52 OTG device each IN endpoint-1 interrupt mask register (OTG_HS_DIEPEACHMSK1)

Address offset: 0x844

Reset value: 0x0000 0000

This register works with the OTG_DIEPINT1 register to generate a dedicated interrupt OTG_HS_EP1_IN for endpoint #1. The IN endpoint interrupt for a specific status in the OTG_DOEPINT1 register can be masked by writing into the corresponding bit in this register. Status bits are masked by default.

### 60.14.53 OTG device each OUT endpoint-1 interrupt mask register (OTG_HS_DOEPEACHMSK1)

Address offset: 0x884

Reset value: 0x0000 0000

This register works with the OTG_DOEPINT1 register to generate a dedicated interrupt OTG_HS_EP1_OUT for endpoint #1. The OUT endpoint interrupt for a specific status in the OTG_DOEPINT1 register can be masked by writing into the corresponding bit in this register. Status bits are masked by default.

0: Masked interrupt
1: Unmasked interrupt

### 60.14.54 OTG device IN endpoint x control register (OTG_DIEPCTLx)

Address offset: 0x900 + 0x20 * x, (x = 0 to 8)

Reset value: 0x0000 0000

The application uses this register to control the behavior of each logical endpoint other than endpoint 0.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **EPENA:** Endpoint enable

The application sets this bit to start transmitting data on an endpoint.

The core clears this bit before setting any of the following interrupts on this endpoint:

– SETUP phase done

– Endpoint disabled

– Transfer completed

Bit 30 **EPDIS:** Endpoint disable

The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the endpoint disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the endpoint disabled interrupt. The application must set this bit only if endpoint enable is already set for this endpoint.

Bit 29 **SODDFRM:** Set odd frame

Applies to isochronous IN and OUT endpoints only.

Writing to this field sets the Even/Odd frame (EONUM) field to odd frame.

Bit 28 **SD0PID:** Set DATA0 PID

Applies to interrupt/bulk IN endpoints only.

Writing to this field sets the endpoint data PID (DPID) field in this register to DATA0.

**SEVNFRM:** Set even frame

Applies to isochronous IN endpoints only.

Writing to this field sets the Even/Odd frame (EONUM) field to even frame.

Bit 27 **SNAK:** Set NAK

A write to this bit sets the NAK bit for the endpoint.

Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for OUT endpoints on a transfer completed interrupt, or after a SETUP is received on the endpoint.

Bit 26 **CNAK:** Clear NAK

A write to this bit clears the NAK bit for the endpoint.

Bits 25:22 **TXFNUM[3:0]:** Tx FIFO number

These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number.
This field is valid only for IN endpoints.

Bit 21 **STALL:** STALL handshake

Applies to non-control, non-isochronous IN endpoints only (access type is rw).
The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core.
Applies to control endpoints only (access type is rs).
The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

Bit 20 Reserved, must be kept at reset value.

Bits 19:18 **EPTYP[1:0]:** Endpoint type

This is the transfer type supported by this logical endpoint.
00: Control
01: Isochronous
10: Bulk
11: Interrupt

Bit 17 **NAKSTS:** NAK status

It indicates the following:
0: The core is transmitting non-NAK handshakes based on the FIFO status.
1: The core is transmitting NAK handshakes on this endpoint.
When either the application or the core sets this bit:
For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there are data available in the Tx FIFO.
For isochronous IN endpoints: The core sends out a zero-length data packet, even if there are data available in the Tx FIFO.
Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

Bit 16 **EONUM:** Even/odd frame

Applies to isochronous IN endpoints only.
Indicates the frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd frame number in which it intends to transmit/receive isochronous data for this endpoint using the SEVNFRM and SODDFRM fields in this register.
0: Even frame
1: Odd frame

**DPID:** Endpoint data PID

Applies to interrupt/bulk IN endpoints only.
Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The application uses the SD0PID register field to program either DATA0 or DATA1 PID.
0: DATA0
1: DATA1

Bit 15 **USBAEP:** USB active endpoint

Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **MPSIZ[10:0]:** Maximum packet size

The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.

## 60.14.55 OTG device IN endpoint x interrupt register (OTG_DIEPINTx)

Address offset: 0x908 + 0x20 * x, (x = 0 to 8)

Reset value: 0x0000 0080

This register indicates the status of an endpoint with respect to USB- and AHB-related events. It is shown in *Figure 745*. The application must read this register when the IN endpoints interrupt bit of the core interrupt register (IEPINT in OTG_GINTSTS) is set. Before the application can read this register, it must first read the device all endpoints interrupt (OTG_DAINT) register to get the exact endpoint number for the device endpoint-x interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG_DAINT and OTG_GINTSTS registers.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | NAK | Res. | PKTDRPSTS | Res. | BNA | TXFIFOUDRN | TXFE | INEPNE | INEPNM | ITTXFE | TOC | AHBERR | EPDISD | XFRC |
| | | rc_w1 | | rc_w1 | | rc_w1 | rc_w1 | r | r | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **NAK:** NAK input

The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to unavailability of data in the Tx FIFO.

Bit 12 Reserved, must be kept at reset value.

Bit 11 **PKTDRPSTS:** Packet dropped status

This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **BNA:** Buffer not available interrupt

The core generates this interrupt when the descriptor accessed is not ready for the core to process, such as host busy or DMA done.

This bit is only valid when Scatter/Gather DMA mode is enabled.

Bit 8 **TXFIFOUDRN:** Transmit Fifo Underrun (TxfifoUndrn)

The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Dependency: This interrupt is valid only when Thresholding is enabled

Bit 7 **TXFE:** Transmit FIFO empty

This interrupt is asserted when the Tx FIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the Tx FIFO Empty Level bit in the OTG_GAHBCFG register (TXFELVL bit in OTG_GAHBCFG).

Bit 6 **INEPNE:** IN endpoint NAK effective

This bit can be cleared when the application clears the IN endpoint NAK by writing to the CNAK bit in OTG_DIEPCTLx.

This interrupt indicates that the core has sampled the NAK bit set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit set by the application has taken effect in the core.

This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.

Bit 5 **INEPNM**: IN token received with EP mismatch

Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.

Bit 4 **ITTXFE:** IN token received when Tx FIFO is empty

Indicates that an IN token was received when the associated Tx FIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.

Bit 3 **TOC:** Timeout condition

Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.

Bit 2 **AHBERR**: AHB error

This is generated only in internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address.

Bit 1 **EPDISD:** Endpoint disabled interrupt

This bit indicates that the endpoint is disabled per the application’s request.

Bit 0 **XFRC:** Transfer completed interrupt

This field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.

### 60.14.56 OTG device IN endpoint 0 transfer size register (OTG_DIEPTSIZ0)

Address offset: 0x910

Reset value: 0x0000 0000

The application must modify this register before enabling endpoint 0. Once endpoint 0 is enabled using the endpoint enable bit in the device control endpoint 0 control registers (EPENA in OTG_DIEPCTL0), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

Nonzero endpoints use the registers for endpoints 1–3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:19 **PKTCNT[1:0]:** Packet count

Indicates the total number of USB packets that constitute the transfer size amount of data for endpoint 0.

This field is decremented every time a packet (maximum size or short packet) is read from the Tx FIFO.

Bits 18:7 Reserved, must be kept at reset value.

Bits 6:0 **XFRSIZ[6:0]:** Transfer size

Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.

The core decrements this field every time a packet from the external memory is written to the Tx FIFO.

### 60.14.57 OTG device IN endpoint x DMA address register (OTG_DIEPDMAx)

Address offset: 0x914 + 0x20 * x, (x = 0 to 8)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| DMAADDR[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DMAADDR[31:0]:** DMA Address

This field holds the start address in the external memory from which the data for the endpoint must be fetched. This register is incremented on every AHB transaction.

## 60.14.58 OTG device IN endpoint transmit FIFO status register (OTG_DTXFSTSx)

Address offset: 0x918 + 0x20 * x, (x = 0 to 8)

Reset value: 0x0000 0200

This read-only register contains the free space information for the device IN endpoint Tx FIFO.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| INEPTFSAV[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INEPTFSAV[15:0]:** IN endpoint Tx FIFO space available

Indicates the amount of free space available in the endpoint Tx FIFO.
Values are in terms of 32-bit words:
0x0: Endpoint Tx FIFO is full
0x1: 1 word available
0x2: 2 words available
0xn: n words available
Others: Reserved

## 60.14.59 OTG device IN endpoint x transfer size register (OTG_DIEPTSIZx)

Address offset: 0x910 + 0x20 * x, (x = 1 to 8)

Reset value: 0x0000 0000

The application must modify this register before enabling the endpoint. Once the endpoint is enabled using the endpoint enable bit in the OTG_DIEPCTLx registers (EPENA bit in OTG_DIEPCTLx), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| XFRSIZ[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **MCNT[1:0]:** Multi count

For periodic IN endpoints, this field indicates the number of packets that must be transmitted per frame on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints.

01: 1 packet

10: 2 packets

11: 3 packets

Bits 28:19 **PKTCNT[9:0]:** Packet count

Indicates the total number of USB packets that constitute the transfer size amount of data for this endpoint.

This field is decremented every time a packet (maximum size or short packet) is read from the Tx FIFO.

Bits 18:0 **XFRSIZ[18:0]:** Transfer size

This field contains the transfer size in bytes for the current endpoint. The core only interrupts the application after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.

The core decrements this field every time a packet from the external memory is written to the Tx FIFO.

## 60.14.60 OTG device control OUT endpoint 0 control register (OTG_DOEPCTL0)

Address offset: 0xB00

Reset value: 0x0000 8000

This section describes the OTG_DOEPCTL0 register. Nonzero control endpoints use registers for endpoints 1–3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | | | | | | | | | | | | | | r | r |

Bit 31 **EPENA:** Endpoint enable

The application sets this bit to start transmitting data on endpoint 0.

The core clears this bit before setting any of the following interrupts on this endpoint:

– SETUP phase done

– Endpoint disabled

– Transfer completed

Bit 30 **EPDIS:** Endpoint disable

The application cannot disable control OUT endpoint 0.

Bits 29:28 Reserved, must be kept at reset value.

Bit 27 **SNAK:** Set NAK

A write to this bit sets the NAK bit for the endpoint.

Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit on a transfer completed interrupt, or after a SETUP is received on the endpoint.

Bit 26 **CNAK:** Clear NAK

A write to this bit clears the NAK bit for the endpoint.

Bits 25:22 Reserved, must be kept at reset value.

Bit 21 **STALL:** STALL handshake

The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

Bit 20 **SNPM:** Snoop mode

This bit configures the endpoint to Snoop mode. In Snoop mode, the core does not check the correctness of OUT packets before transferring them to application memory.

Bits 19:18 **EPTYP[1:0]:** Endpoint type

Hardcoded to 2'b00 for control.

Bit 17 **NAKSTS:** NAK status

Indicates the following:

0: The core is transmitting non-NAK handshakes based on the FIFO status.

1: The core is transmitting NAK handshakes on this endpoint.

When either the application or the core sets this bit, the core stops receiving data, even if there is space in the Rx FIFO to accommodate the incoming packet. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

Bit 16 Reserved, must be kept at reset value.

Bit 15 **USBAEP:** USB active endpoint

This bit is always set to 1, indicating that a control endpoint 0 is always active in all configurations and interfaces.

Bits 14:2 Reserved, must be kept at reset value.

Bits 1:0 **MPSIZ[1:0]:** Maximum packet size

The maximum packet size for control OUT endpoint 0 is the same as what is programmed in control IN endpoint 0.

00: 64 bytes

01: 32 bytes

10: 16 bytes

11: 8 bytes

### 60.14.61 OTG device OUT endpoint x interrupt register (OTG_DOEPINTx)

Address offset: 0xB08 + 0x20 * x, (x = 0 to 8)

Reset value: 0x0000 0080

This register indicates the status of an endpoint with respect to USB- and AHB-related events. It is shown in *Figure 745*. The application must read this register when the OUT endpoints interrupt bit of the OTG_GINTSTS register (OEPINT bit in OTG_GINTSTS) is set. Before the application can read this register, it must first read the OTG_DAINT register to get the exact endpoint number for the OTG_DOEPINTx register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG_DAINT and OTG_GINTSTS registers.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| STPK TRX | NYET | NAK | BERR | Res. | Res. | BNA | OUT PKT ERR | Res. | B2B STUP | STSPH SRX | OTEP DIS | STUP | AHB ERR | EP DISD | XFRC |
| rc_w1 | rc_w1 | rc_w1 | rc_w1 | | | rc_w1 | rc_w1 | | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **STPKTRX:** Setup packet received.

Applicable for control OUT endpoints in only in the Buffer DMA Mode. Set by the OTG, this bit indicates that this buffer holds 8 bytes of setup data. There is only one setup packet per buffer. On receiving a setup packet, the OTG closes the buffer and disables the corresponding endpoint after SETUP_COMPLETE status is seen in the Rx FIFO. OTG puts a SETUP_COMPLETE status into the Rx FIFO when it sees the first IN or OUT token after the SETUP packet for that particular endpoint. The application must then re-enable the endpoint to receive any OUT data for the control transfer and reprogram the buffer start address. Because of the above behavior, OTG can receive any number of back to back setup packets and one buffer for every setup packet is used.

Bit 14 **NYET:** NYET interrupt

This interrupt is generated when a NYET response is transmitted for a non isochronous OUT endpoint.

Bit 13 **NAK:** NAK input

The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to unavailability of data in the Tx FIFO.

Bit 12 **BERR:** Babble error interrupt

The core generates this interrupt when babble is received for the endpoint.

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **BNA:** Buffer not available interrupt

The core generates this interrupt when the descriptor accessed is not ready for the core to process, such as host busy or DMA done.

This bit is only valid when Scatter/Gather DMA mode is enabled.

Bit 8 **OUTPKTERR**: OUT packet error

This interrupt is asserted when the core detects an overflow or a CRC error for an OUT packet. This interrupt is valid only when thresholding is enabled.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **B2BSTUP:** Back-to-back SETUP packets received

Applies to control OUT endpoint only.

This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint.

Bit 5 **STSPHSRX**: Status phase received for control write

This interrupt is valid only for control OUT endpoints. This interrupt is generated only after OTG has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a control write transfer. The application can use this interrupt to ACK or STALL the status phase, after it has decoded the data phase.

Bit 4 **OTEPDIS:** OUT token received when endpoint disabled

Applies only to control OUT endpoints.

Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.

Bit 3 **STUP:** SETUP phase done

Applies to control OUT endpoint only.Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.

Bit 2 **AHBERR**: AHB error

This is generated only in internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address.

Bit 1 **EPDISD:** Endpoint disabled interrupt

This bit indicates that the endpoint is disabled per the application’s request.

Bit 0 **XFRC:** Transfer completed interrupt

This field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.

### 60.14.62 OTG device OUT endpoint 0 transfer size register (OTG_DOEPTSIZ0)

Address offset: 0xB10

Reset value: 0x0000 0000

The application must modify this register before enabling endpoint 0. Once endpoint 0 is enabled using the endpoint enable bit in the OTG_DOEPCTL0 registers (EPENA bit in OTG_DOEPCTL0), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

Nonzero endpoints use the registers for endpoints 1–8.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **STUPCNT[1:0]:** SETUP packet count

This field specifies the number of back-to-back SETUP data packets the endpoint can receive.
01: 1 packet
10: 2 packets
11: 3 packets

Bits 28:20 Reserved, must be kept at reset value.

Bit 19 **PKTCNT:** Packet count

This field is decremented to zero after a packet is written into the Rx FIFO.

Bits 18:7 Reserved, must be kept at reset value.

Bits 6:0 **XFRSIZ[6:0]:** Transfer size

Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.
The core decrements this field every time a packet is read from the Rx FIFO and written to the external memory.

### 60.14.63 OTG device OUT endpoint x DMA address register (OTG_DOEPDMAx)

Address offset: 0xB14 + 0x20 * x, (x = 0 to 8)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DMAADDR[31:0]:** DMA Address

This field holds the start address in the external memory from which the data for the endpoint must be fetched. This register is incremented on every AHB transaction.

### 60.14.64 OTG device OUT endpoint x control register (OTG_DOEPCTLx)

Address offset: 0xB00 + 0x20 * x, (x = 1 to 8)

Reset value: 0x0000 0000

The application uses this register to control the behavior of each logical endpoint other than endpoint 0.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **EPENA:** Endpoint enable

Applies to IN and OUT endpoints.
The application sets this bit to start transmitting data on an endpoint.
The core clears this bit before setting any of the following interrupts on this endpoint:
– SETUP phase done
– Endpoint disabled
– Transfer completed

Bit 30 **EPDIS:** Endpoint disable

The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the endpoint disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the endpoint disabled interrupt. The application must set this bit only if endpoint enable is already set for this endpoint.

Bit 29 **SD1PID:** Set DATA1 PID

Applies to interrupt/bulk IN and OUT endpoints only. Writing to this field sets the endpoint data PID (DPID) field in this register to DATA1.

**SODDFRM:** Set odd frame

Applies to isochronous IN and OUT endpoints only. Writing to this field sets the Even/Odd frame (EONUM) field to odd frame.

Bit 28 **SD0PID:** Set DATA0 PID

Applies to interrupt/bulk OUT endpoints only.
Writing to this field sets the endpoint data PID (DPID) field in this register to DATA0.

**SEVNFRM:** Set even frame

Applies to isochronous OUT endpoints only.
Writing to this field sets the Even/Odd frame (EONUM) field to even frame.

Bit 27 **SNAK:** Set NAK

A write to this bit sets the NAK bit for the endpoint.
Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for OUT endpoints on a transfer completed interrupt, or after a SETUP is received on the endpoint.

Bit 26 **CNAK:** Clear NAK

A write to this bit clears the NAK bit for the endpoint.

Bits 25:22 Reserved, must be kept at reset value.

Bit 21 **STALL:** STALL handshake

Applies to non-control, non-isochronous OUT endpoints only (access type is rw).
The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core.
Applies to control endpoints only (access type is rs).
The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

Bit 20 **SNPM:** Snoop mode

This bit configures the endpoint to Snoop mode. In Snoop mode, the core does not check the correctness of OUT packets before transferring them to application memory.

Bits 19:18 **EPTYP[1:0]:** Endpoint type

This is the transfer type supported by this logical endpoint.
00: Control
01: Isochronous
10: Bulk
11: Interrupt

Bit 17 **NAKSTS:** NAK status

Indicates the following:
0: The core is transmitting non-NAK handshakes based on the FIFO status.
1: The core is transmitting NAK handshakes on this endpoint.
When either the application or the core sets this bit:
The core stops receiving any data on an OUT endpoint, even if there is space in the Rx FIFO to accommodate the incoming packet.
Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

Bit 16 **EONUM:** Even/odd frame

Applies to isochronous IN and OUT endpoints only.
Indicates the frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd frame number in which it intends to transmit/receive isochronous data for this endpoint using the SEVNFRM and SODDFRM fields in this register.
0: Even frame
1: Odd frame

**DPID:** Endpoint data PID

Applies to interrupt/bulk OUT endpoints only.
Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The application uses the SD0PID register field to program either DATA0 or DATA1 PID.
0: DATA0
1: DATA1

Bit 15 **USBAEP:** USB active endpoint

Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **MPSIZ[10:0]:** Maximum packet size

The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.

### 60.14.65 OTG device OUT endpoint x transfer size register (OTG_DOEPTSIZx)

Address offset: 0xB10 + 0x20 * x, (x = 1 to 8)

Reset value: 0x0000 0000

The application must modify this register before enabling the endpoint. Once the endpoint is enabled using endpoint enable bit of the OTG_DOEPCTLx registers (EPENA bit in OTG_DOEPCTLx), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| XFRSIZ[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **RXDPID[1:0]:** Received data PID

Applies to isochronous OUT endpoints only.
This is the data PID received in the last packet for this endpoint.
00: DATA0
01: DATA2
10: DATA1
11: MDATA

**STUPCNT[1:0]:** SETUP packet count

Applies to control OUT endpoints only.
This field specifies the number of back-to-back SETUP data packets the endpoint can receive.
01: 1 packet
10: 2 packets
11: 3 packets

Bits 28:19 **PKTCNT[9:0]:** Packet count

Indicates the total number of USB packets that constitute the transfer size amount of data for this endpoint.
This field is decremented every time a packet (maximum size or short packet) is written to the Rx FIFO.

Bits 18:0 **XFRSIZ[18:0]:** Transfer size

This field contains the transfer size in bytes for the current endpoint. The core only interrupts the application after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.
The core decrements this field every time a packet is read from the Rx FIFO and written to the external memory.

### 60.14.66 OTG power and clock gating control register (OTG_PCGCCTL)

Address offset: 0xE00

Reset value: 0x200B 8000

This register is available in host and device modes.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | rw | r | | | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **SUSP:** Deep Sleep

This bit indicates that the PHY is in Deep Sleep when in L1 state.

Bit 6 **PHYSLEEP:** PHY in Sleep

This bit indicates that the PHY is in the Sleep state.

Bit 5 **ENL1GTG:** Enable sleep clock gating

When this bit is set, core internal clock gating is enabled in Sleep state if the core cannot assert utmi_l1_suspend_n. When this bit is not set, the PHY clock is not gated in Sleep state.

Bit 4 **PHYSUSP:** PHY suspended

Indicates that the PHY has been suspended. This bit is updated once the PHY is suspended after the application has set the STPPCLK bit.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **GATEHCLK:** Gate HCLK

The application sets this bit to gate HCLK to modules other than the AHB Slave and Master and wakeup logic when the USB is suspended or the session is not valid. The application clears this bit when the USB is resumed or a new session starts.

Bit 0 **STPPCLK:** Stop PHY clock

The application sets this bit to stop the PHY clock when the USB is suspended, the session is not valid, or the device is disconnected. The application clears this bit when the USB is resumed or a new session starts.

## 60.14.67 OTG register map

The table below gives the USB OTG register map and reset values.

**Table 468. OTG register map and reset values**

| Offset | Register name | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

## 60.15 OTG programming model

### 60.15.1 Core initialization

The application must perform the core initialization sequence. If the cable is connected during power-up, the current mode of operation bit in the OTG_GINTSTS (CMOD bit in OTG_GINTSTS) reflects the mode. The OTG controller enters host mode when an “A” plug is connected or device mode when a “B” plug is connected.

This section explains the initialization of the OTG controller after power-on. The application must follow the initialization sequence irrespective of host or device mode operation. All core global registers are initialized according to the core’s configuration:

1. Program the following fields in the OTG_GAHBCFG register:
   - Global interrupt mask bit GINTMSK = 1
   - Rx FIFO non-empty (RXFLVL bit in OTG_GINTSTS)
   - Periodic Tx FIFO empty level
2. Program the following fields in the OTG_GUSBCFG register:
   - HNP capable bit
   - SRP capable bit
   - OTG timeout calibration field
   - USB turnaround time field
3. The software must unmask the following bits in the OTG_GINTMSK register:

   OTG interrupt mask

   Mode mismatch interrupt mask
4. The software can read the CMOD bit in OTG_GINTSTS to determine whether the OTG controller is operating in host or device mode.

### 60.15.2 Host initialization

To initialize the core as host, the application must perform the following steps:

1. Program the HPRTINT in the OTG_GINTMSK register to unmask
2. Program the OTG_HCFG register to select full-speed host
3. Program the PPWR bit in OTG_HPRT to 1. This drives $V_{BUS}$ on the USB.
4. Wait for the PCDET interrupt in OTG_HPRT0. This indicates that a device is connecting to the port.
5. Program the PRST bit in OTG_HPRT to 1. This starts the reset process.
6. Wait at least 10 ms for the reset process to complete.
7. Program the PRST bit in OTG_HPRT to 0.
8. Wait for the PENCHNG interrupt in OTG_HPRT.
9. Read the PSPD bit in OTG_HPRT to get the enumerated speed.
10. Program the HFIR register with a value corresponding to the selected PHY clock 1
11. Program the FSLSPCS field in the OTG_HCFG register following the speed of the device detected in step 9. If FSLSPCS has been changed a port reset must be performed.
12. Program the OTG_GRXFSIZ register to select the size of the receive FIFO.
13. Program the OTG_HNPTXFSIZ register to select the size and the start address of the Non-periodic transmit FIFO for non-periodic transactions.
14. Program the OTG_HPTXFSIZ register to select the size and start address of the periodic transmit FIFO for periodic transactions.

To communicate with devices, the system software must initialize and enable at least one channel.

### 60.15.3 Device initialization

The application must perform the following steps to initialize the core as a device on power-up or after a mode change from host to device.

1. Program the following fields in the OTG_DCFG register:
   - Device speed
   - Non-zero-length status OUT handshake
2. Program the OTG_GINTMSK register to unmask the following interrupts:
   - USB reset
   - Enumeration done
   - Early suspend
   - USB suspend
   - SOF
3. Wait for the USBRST interrupt in OTG_GINTSTS. It indicates that a reset has been detected on the USB that lasts for about 10 ms on receiving this interrupt.

Wait for the ENUMDNE interrupt in OTG_GINTSTS. This interrupt indicates the end of reset on the USB. On receiving this interrupt, the application must read the OTG_DSTS register to determine the enumeration speed and perform the steps listed in *Endpoint initialization on enumeration completion on page 3268*.

At this point, the device is ready to accept SOF packets and perform control transfers on control endpoint 0.

## 60.15.4 DMA mode

The OTG host uses the AHB master interface to fetch the transmit packet data (AHB to USB) and receive the data update (USB to AHB). The AHB master uses the programmed DMA address (OTG_HCDMAx register in host mode and OTG_DIEPDMAx/OTG_DOEPDMAx register in peripheral mode) to access the data buffers.

### Scatter/Gather DMA mode

In Scatter/Gather DMA mode, the core implements a true scatter/gather memory distribution in which data buffers are scattered over the system memory. However, the descriptors themselves are continuous. Each channel memory structure is implemented as a contiguous list of descriptors; each descriptor points to a data buffer of predefined size. In addition to the buffer pointer (a 32-bit word), the descriptor also has a status quadlet (32-bit word). When the list is implemented as a ring buffer, the list processor switches to the first element of the list when it encounters last bit. All channels (control, bulk, interrupt, and isochronous) implement these structures in memory. When Scatter/Gather DMA is enabled in device mode, OTG_DIEPDMAx and OTG_DOEPDMAx registers are used to access the base descriptor.

## 60.15.5 Host programming model

### Channel initialization

The application must initialize one or more channels before it can communicate with connected devices. To initialize and enable a channel, the application must perform the following steps:

1. Program the OTG_GINTMSK register to unmask the following:
2. Channel interrupt
   - Non-periodic transmit FIFO empty for OUT transactions (applicable when operating in pipelined transaction-level with the packet count field programmed with more than one).
   - Non-periodic transmit FIFO half-empty for OUT transactions (applicable when operating in pipelined transaction-level with the packet count field programmed with more than one).
3. Program the OTG_HAINTMSK register to unmask the selected channels' interrupts.
4. Program the OTG_HCINTMSK register to unmask the transaction-related interrupts of interest given in the host channel interrupt register.
5. Program the selected channel's OTG_HCTSIZx register with the total transfer size, in bytes, and the expected number of packets, including short packets. The application must program the PID field with the initial data PID (to be used on the first OUT transaction or to be expected from the first IN transaction).
6. Program the OTG_HCCHARx register of the selected channel with the device's endpoint characteristics, such as type, speed, direction, and so forth. (The channel can be enabled by setting the channel enable bit to 1 only when the application is ready to transmit or receive any packet).
7. Program the selected channels in the OTG_HCSPLTx register(s) with the hub and port addresses (split transactions only).
8. Program the selected channels in the OTG_HCDMAx register(s) with the buffer start address (DMA transactions only).

### Halting a channel

The application can disable any channel by programming the OTG_HCCHARx register with the CHDIS and CHENA bits set to 1. This enables the OTG host to flush the posted requests (if any) and generates a channel halted interrupt. The application must wait for the CHH interrupt in OTG_HCINTx before reallocating the channel for other transactions. The OTG host does not interrupt the transaction that has already been started on the USB.

To disable a channel in DMA mode operation, the application does not need to check for space in the request queue. The OTG host checks for space to write the disable

request on the disabled channel's turn during arbitration. Meanwhile, all posted requests are dropped from the request queue when the CHDIS bit in OTG_HCCHARx is set to 1.

Before disabling a channel, the application must ensure that there is at least one free space available in the non-periodic request queue (when disabling a non-periodic channel) or the periodic request queue (when disabling a periodic channel). The application can simply flush the posted requests when the request queue is full (before disabling the channel), by programming the OTG_HCCHARx register with the CHDIS bit set to 1, and the CHENA bit cleared to 0.

The application is expected to disable a channel on any of the following conditions:

1. When an STALL, TXERR, BBERR or DTERR interrupt in OTG_HCINTx is received for an IN or OUT channel. The application must be able to receive other interrupts (DTERR, Nak, data, TXERR) for the same channel before receiving the halt.
2. When an XFRC interrupt in OTG_HCINTx is received during a non periodic IN transfer or high-bandwidth interrupt IN transfer
3. When a DISCINT (disconnect device) interrupt in OTG_GINTSTS is received. (The application is expected to disable all enabled channels).
4. When the application aborts a transfer before normal completion.

### Ping protocol

When the OTG host operates in high speed, the application must initiate the ping protocol when communicating with high-speed bulk or control (data and status stage) OUT endpoints.The application must initiate the ping protocol when it receives a NAK/NYET/TXERR interrupt. When the OTG host receives one of the above responses, it does not continue any transaction for a specific endpoint, drops all posted or fetched OUT requests (from the request queue), and flushes the corresponding data (from the transmit FIFO).This is valid in slave mode only. In Slave mode, the application can send a ping token either by setting the DOPING bit in OTG_HCTSIZx before enabling the channel or by just writing the OTG_HCTSIZx register with the DOPING bit set when the channel is already enabled. This enables the OTG host to write a ping request entry to the request queue. The application must wait for the response to the ping token (a NAK, ACK, or TXERR interrupt) before continuing the transaction or sending another ping token. The application can continue the data transaction only after receiving an ACK from the OUT endpoint for the requested ping. In DMA mode operation, the application does not need to set the DOPING bit in OTG_HCTSIZx for a NAK/NYET response in case of bulk/control OUT. The OTG host automatically sets the DOPING bit in OTG_HCTSIZx, and issues the ping tokens for bulk/control OUT. The OTG host continues sending ping tokens until it receives an ACK, and then switches automatically to the data transaction.

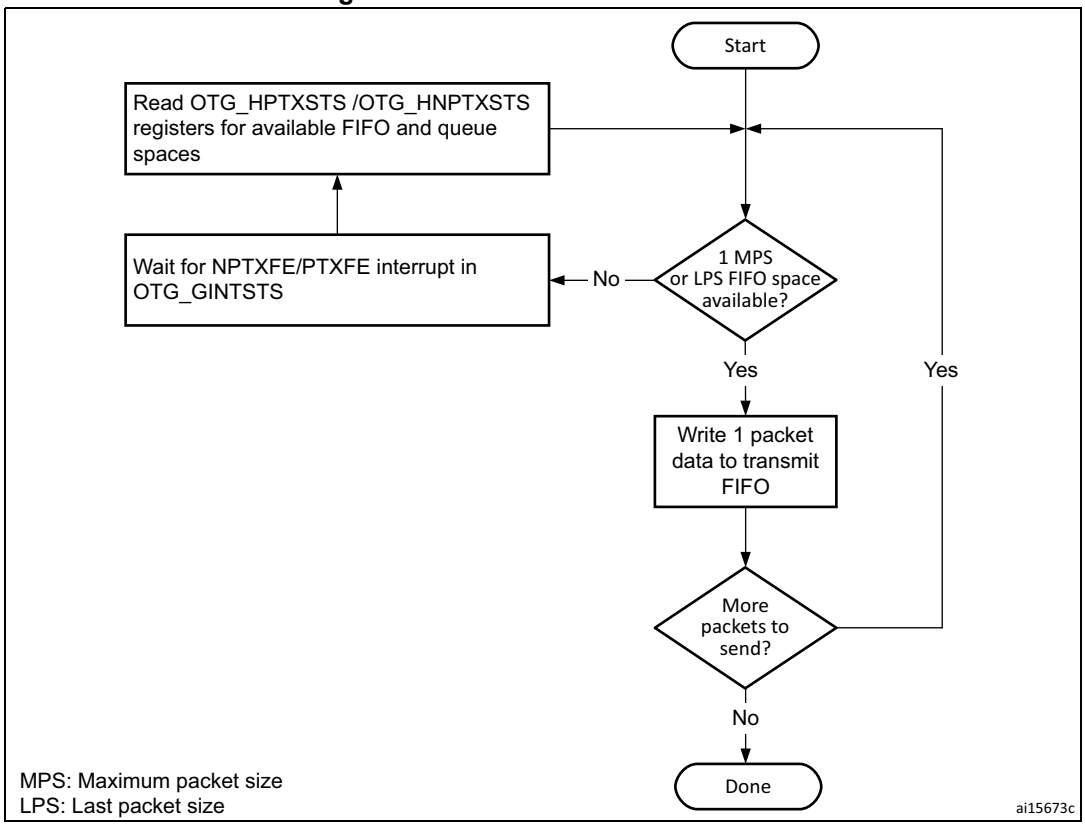
## Operational model

The application must initialize a channel before communicating to the connected device. This section explains the sequence of operation to be performed for different types of USB transactions.

- **Writing the transmit FIFO**

  The OTG host automatically writes an entry (OUT request) to the periodic/non-periodic request queue, along with the last 32-bit word write of a packet. The application must ensure that at least one free space is available in the periodic/non-periodic request queue before starting to write to the transmit FIFO. The application must always write to the transmit FIFO in 32-bit words. If the packet size is non-32-bit word aligned, the application must use padding. The OTG host determines the actual packet size based on the programmed maximum packet size and transfer size.

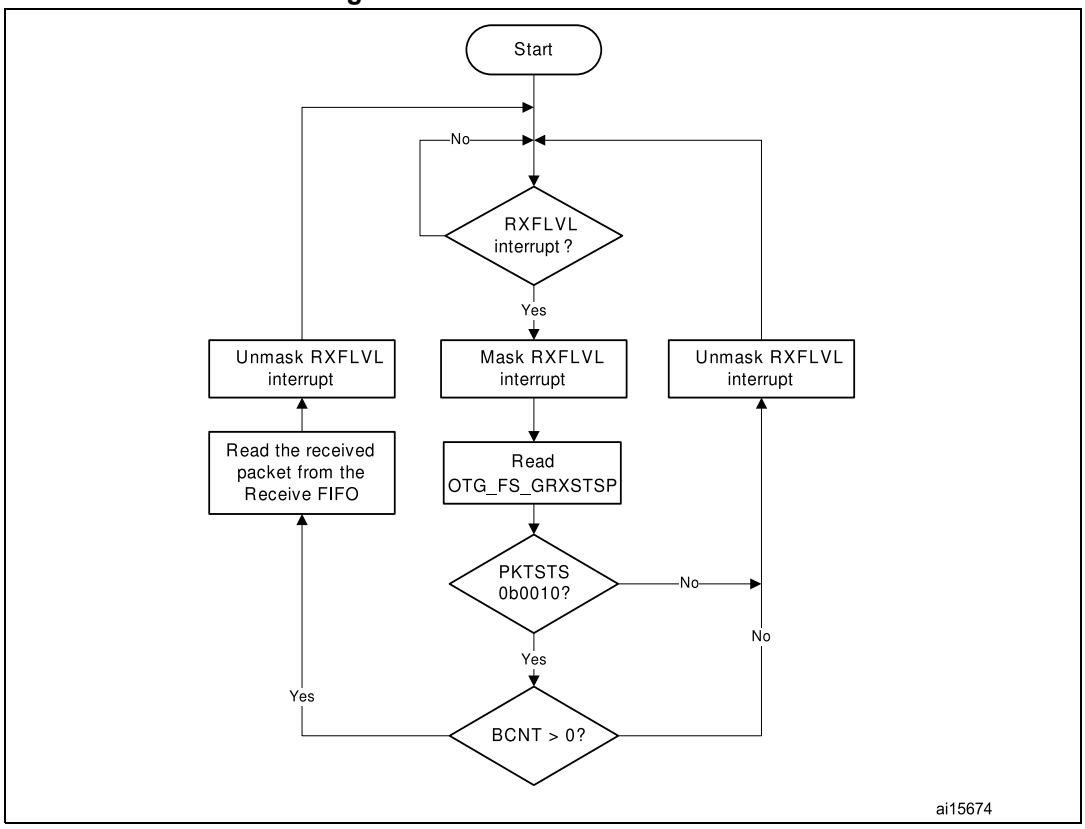
**Figure 746. Transmit FIFO write task**



- **Reading the receive FIFO**

  The application must ignore all packet statuses other than IN data packet (bx0010).

**Figure 747. Receive FIFO read task**



- **Bulk and control OUT/SETUP transactions**

  A typical bulk or control OUT/SETUP pipelined transaction-level operation is shown in *Figure 748*. See channel 1 (ch_1). Two bulk OUT packets are transmitted. A control SETUP transaction operates in the same way but has only one packet. The assumptions are:

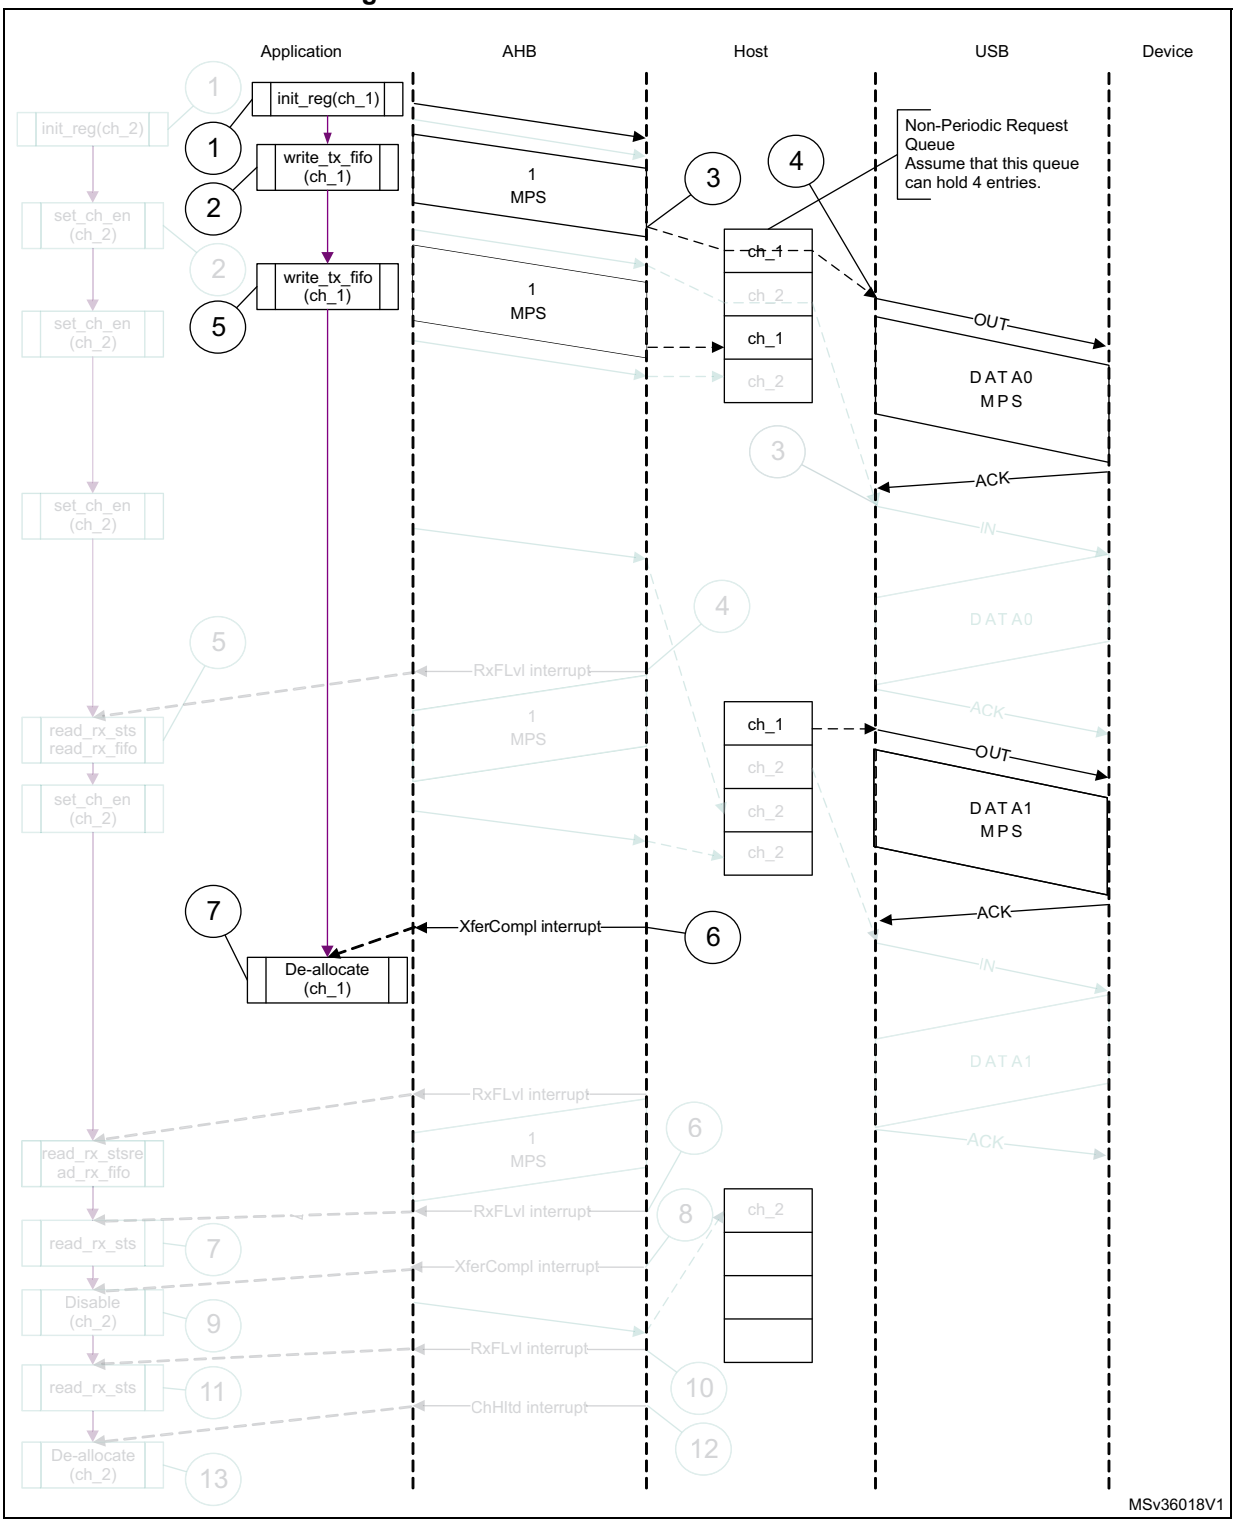
  – The application is attempting to send two maximum-packet-size packets (transfer size = 1, 024 bytes).
  – The non-periodic transmit FIFO can hold two packets (1 KB for HS).
  – The non-periodic request queue depth = 4.

- **Normal bulk and control OUT/SETUP operations**

  The sequence of operations in (channel 1) is as follows:

1. Initialize channel 1
2. Write the first packet for channel 1
3. Along with the last word write, the core writes an entry to the non-periodic request queue
4. As soon as the non-periodic queue becomes non-empty, the core attempts to send an OUT token in the current frame
5. Write the second (last) packet for channel 1
6. The core generates the XFRC interrupt as soon as the last transaction is completed successfully
7. In response to the XFRC interrupt, de-allocate the channel for other transfers
8. Handling non-ACK responses

**Figure 748. Normal bulk/control OUT/SETUP**



1. The grayed elements are not relevant in the context of this figure.

The channel-specific interrupt service routine for bulk and control OUT/SETUP transactions is shown in the following code samples.

- **Interrupt service routine for bulk/control OUT/SETUP and bulk/control IN transactions**

  a) Bulk/control OUT/SETUP

```
Unmask (NAK/TXERR/STALL/XFRC)
if (XFRC)
   {
   Reset Error Count
   Mask ACK
   De-allocate Channel
   }
else if (STALL)
   {
   Transfer Done = 1
   Unmask CHH
   Disable Channel
   }
else if (NAK or TXERR )
   {
   Rewind Buffer Pointers
   Unmask CHH
   Disable Channel
   if (TXERR)
      {
      Increment Error Count
      Unmask ACK
      }
   else
      {
      Reset Error Count
      }
      }
else if (CHH)
   {
   Mask CHH
   if (Transfer Done or (Error_count == 3))
      {
      De-allocate Channel
      }
   else
      {
      Re-initialize Channel
      }
   }
```

```
   else if (ACK)
      {
      Reset Error Count
      Mask ACK
      }
```

The application is expected to write the data packets into the transmit FIFO when the space is available in the transmit FIFO and the request queue. The application can make use of the NPTXFE interrupt in OTG_GINTSTS to find the transmit FIFO space.

b) Bulk/control IN

```
Unmask (TXERR/XFRC/BBERR/STALL/DTERR)
if (XFRC)
   {
   Reset Error Count
   Unmask CHH
   Disable Channel
   Reset Error Count
   Mask ACK
   }
else if (TXERR or BBERR or STALL)
   {
   Unmask CHH
   Disable Channel
   if (TXERR)
      {
      Increment Error Count
      Unmask ACK
      }
   }
else if (CHH)
   {
   Mask CHH
   if (Transfer Done or (Error_count == 3))
      {
      De-allocate Channel
      }
   else
      {
      Re-initialize Channel
      }
   }
else if (ACK)
   {
   Reset Error Count
   Mask ACK
   }
```

```
else if (DTERR)
   {
   Reset Error Count
   }
```

The application is expected to write the requests as and when the request queue space is available and until the XFRC interrupt is received.

- **Bulk and control IN transactions**

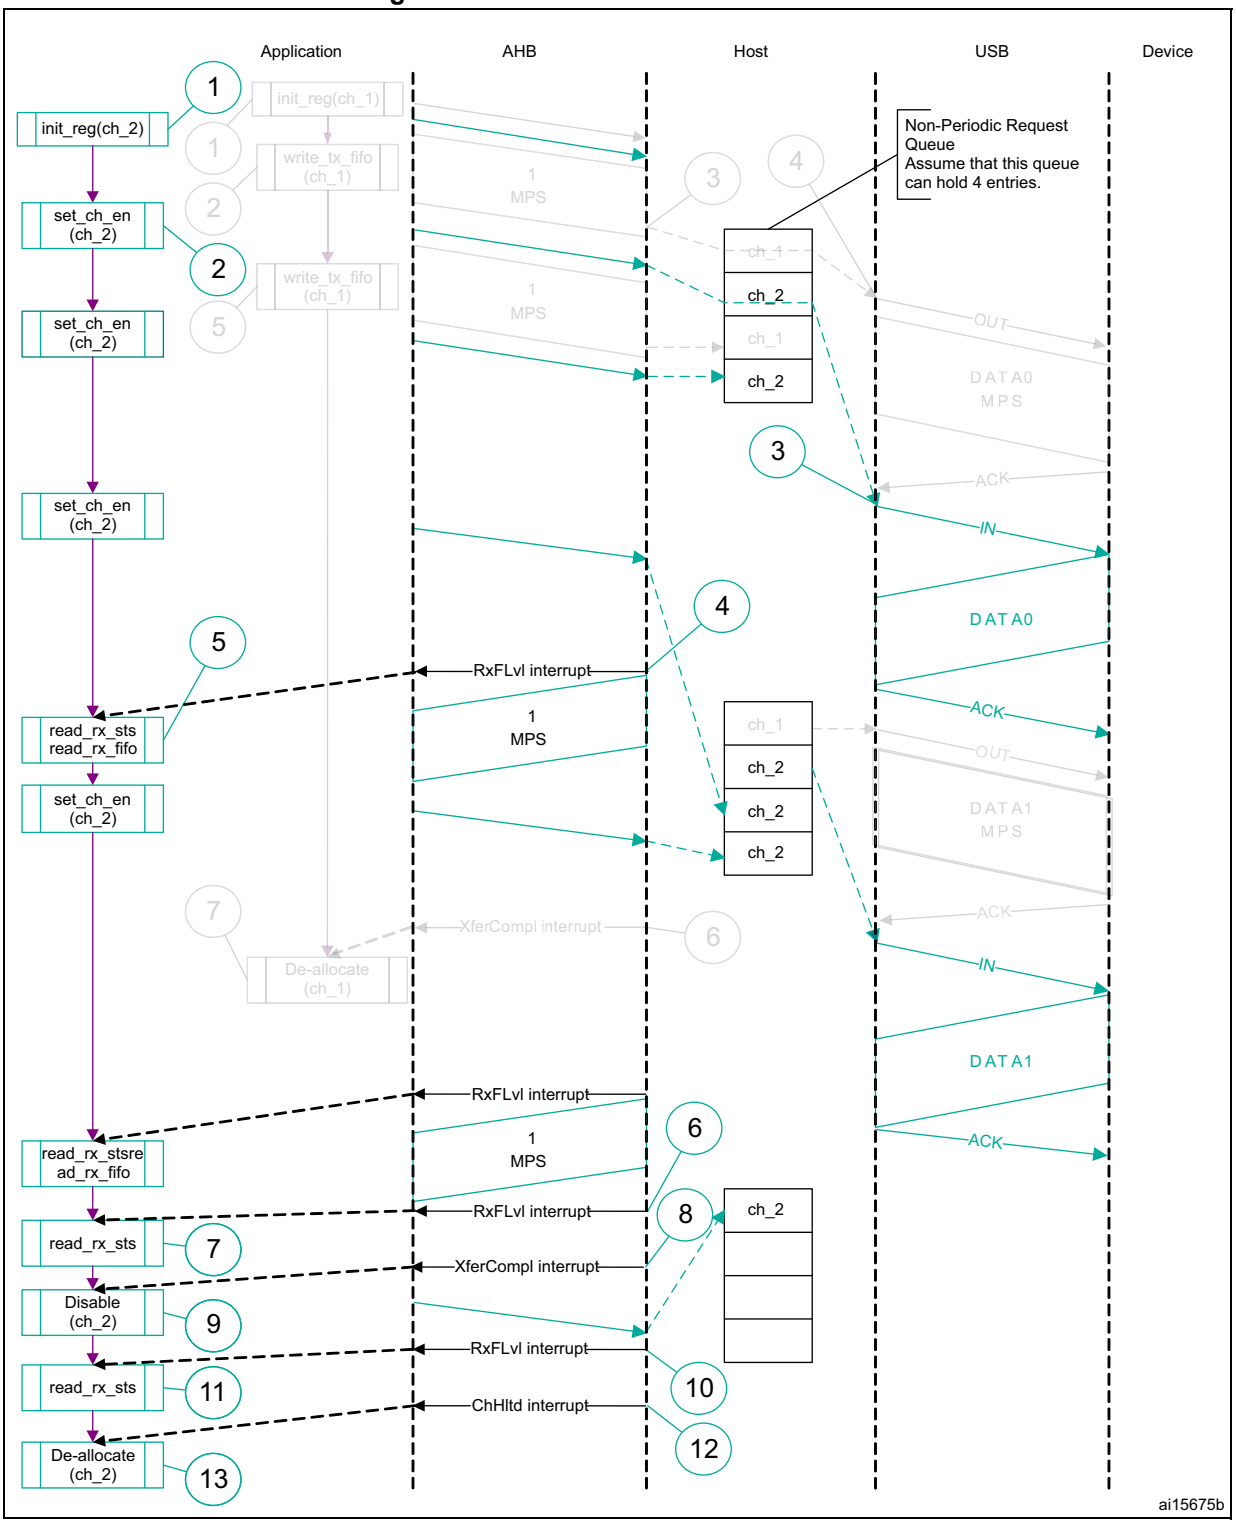
  A typical bulk or control IN pipelined transaction-level operation is shown in *Figure 749*. See channel 2 (ch_2). The assumptions are:

  – The application is attempting to receive two maximum-packet-size packets (transfer size = 1 024 bytes).

  – The receive FIFO can contain at least one maximum-packet-size packet and two status words per packet (520 bytes for HS).

  – The non-periodic request queue depth = 4.

**Figure 749. Bulk/control IN transactions**



1. The grayed elements are not relevant in the context of this figure.

The sequence of operations is as follows:

1. Initialize channel 2.
2. Set the CHENA bit in OTG_HCCHAR2 to write an IN request to the non-periodic request queue.
3. The core attempts to send an IN token after completing the current OUT transaction.
4. The core generates an RXFLVL interrupt as soon as the received packet is written to the receive FIFO.
5. In response to the RXFLVL interrupt, mask the RXFLVL interrupt and read the received packet status to determine the number of bytes received, then read the receive FIFO accordingly. Following this, unmask the RXFLVL interrupt.
6. The core generates the RXFLVL interrupt for the transfer completion status entry in the receive FIFO.
7. The application must read and ignore the receive packet status when the receive packet status is not an IN data packet (PKTSTS in OTG_GRXSTSR ≠ 0b0010).
8. The core generates the XFRC interrupt as soon as the receive packet status is read.
9. In response to the XFRC interrupt, disable the channel and stop writing the OTG_HCCHAR2 register for further requests. The core writes a channel disable request to the non-periodic request queue as soon as the OTG_HCCHAR2 register is written.
10. The core generates the RXFLVL interrupt as soon as the halt status is written to the receive FIFO.
11. Read and ignore the receive packet status.
12. The core generates a CHH interrupt as soon as the halt status is popped from the receive FIFO.
13. In response to the CHH interrupt, de-allocate the channel for other transfers.
14. Handling non-ACK responses

- **Control transactions**

  Setup, data, and status stages of a control transfer must be performed as three separate transfers. setup-, data- or status-stage OUT transactions are performed similarly to the bulk OUT transactions explained previously. Data- or status-stage IN transactions are performed similarly to the bulk IN transactions explained previously. For all three stages, the application is expected to set the EPTYP field in OTG_HCCHAR1 to control. During the setup stage, the application is expected to set the PID field in OTG_HCTSIZ1 to SETUP.

- **Interrupt OUT transactions**

  A typical interrupt OUT operation is shown in *Figure 750*. The assumptions are:

  – The application is attempting to send one packet in every frame (up to 1 maximum packet size), starting with the odd frame (transfer size = 1 024 bytes)

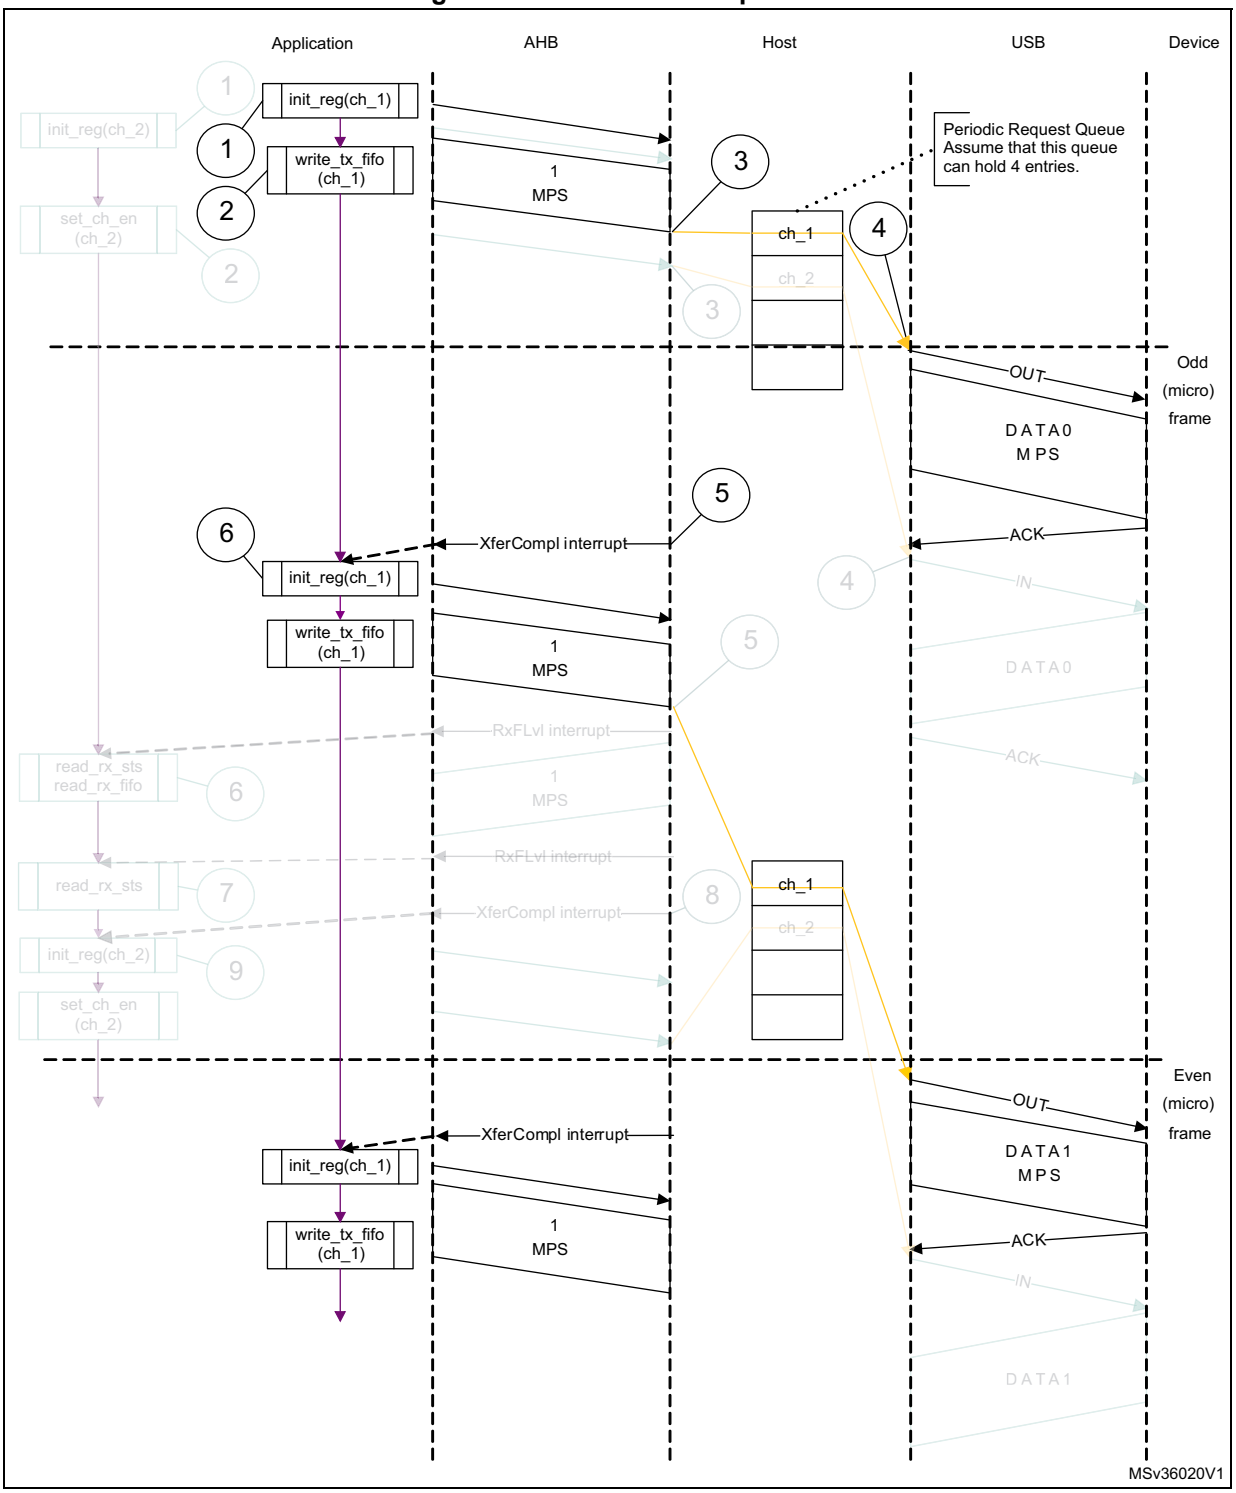
  – The periodic transmit FIFO can hold one packet (1 KB)

  – Periodic request queue depth = 4

  The sequence of operations is as follows:

1. Initialize and enable channel 1. The application must set the ODDFRM bit in OTG_HCCHAR1.
2. Write the first packet for channel 1.
3. Along with the last word write of each packet, the OTG host writes an entry to the periodic request queue.
4. The OTG host attempts to send an OUT token in the next (odd) frame.
5. The OTG host generates an XFRC interrupt as soon as the last packet is transmitted successfully.
6. In response to the XFRC interrupt, reinitialize the channel for the next transfer.

**Figure 750. Normal interrupt OUT**



1. The grayed elements are not relevant in the context of this figure.

- **Interrupt service routine for interrupt OUT/IN transactions**

  a) Interrupt OUT

```
Unmask (NAK/TXERR/STALL/XFRC/FRMOR)
```

```
if (XFRC)
   {
   Reset Error Count
   Mask ACK
   De-allocate Channel
   }
else
   if (STALL or FRMOR)
      {
      Mask ACK
      Unmask CHH
      Disable Channel
      if (STALL)
         {
         Transfer Done = 1
         }
      }
   else
      if (NAK or TXERR)
         {
         Rewind Buffer Pointers
         Reset Error Count
         Mask ACK
         Unmask CHH
         Disable Channel
         }
      else
         if (CHH)
         {
         Mask CHH
         if (Transfer Done or (Error_count == 3))
            {
            De-allocate Channel
            }
         else
            {
            Re-initialize Channel (in next b_interval - 1 Frame)
            }
         }
      else
         if (ACK)
         {
         Reset Error Count
         Mask ACK
         }
```

```
The application uses the NPTXFE interrupt in OTG_GINTSTS to find the
transmit FIFO space.
Interrupt IN
Unmask (NAK/TXERR/XFRC/BBERR/STALL/FRMOR/DTERR)
if (XFRC)

      {
      Reset Error Count
      Mask ACK
      }
```

- **Interrupt IN transactions**

  The assumptions are:

  – The application is attempting to receive one packet (up to 1 maximum packet size) in every frame, starting with odd (transfer size = 1 024 bytes).

  – The receive FIFO can hold at least one maximum-packet-size packet and two status words per packet (1 031 bytes).

  – Periodic request queue depth = 4.

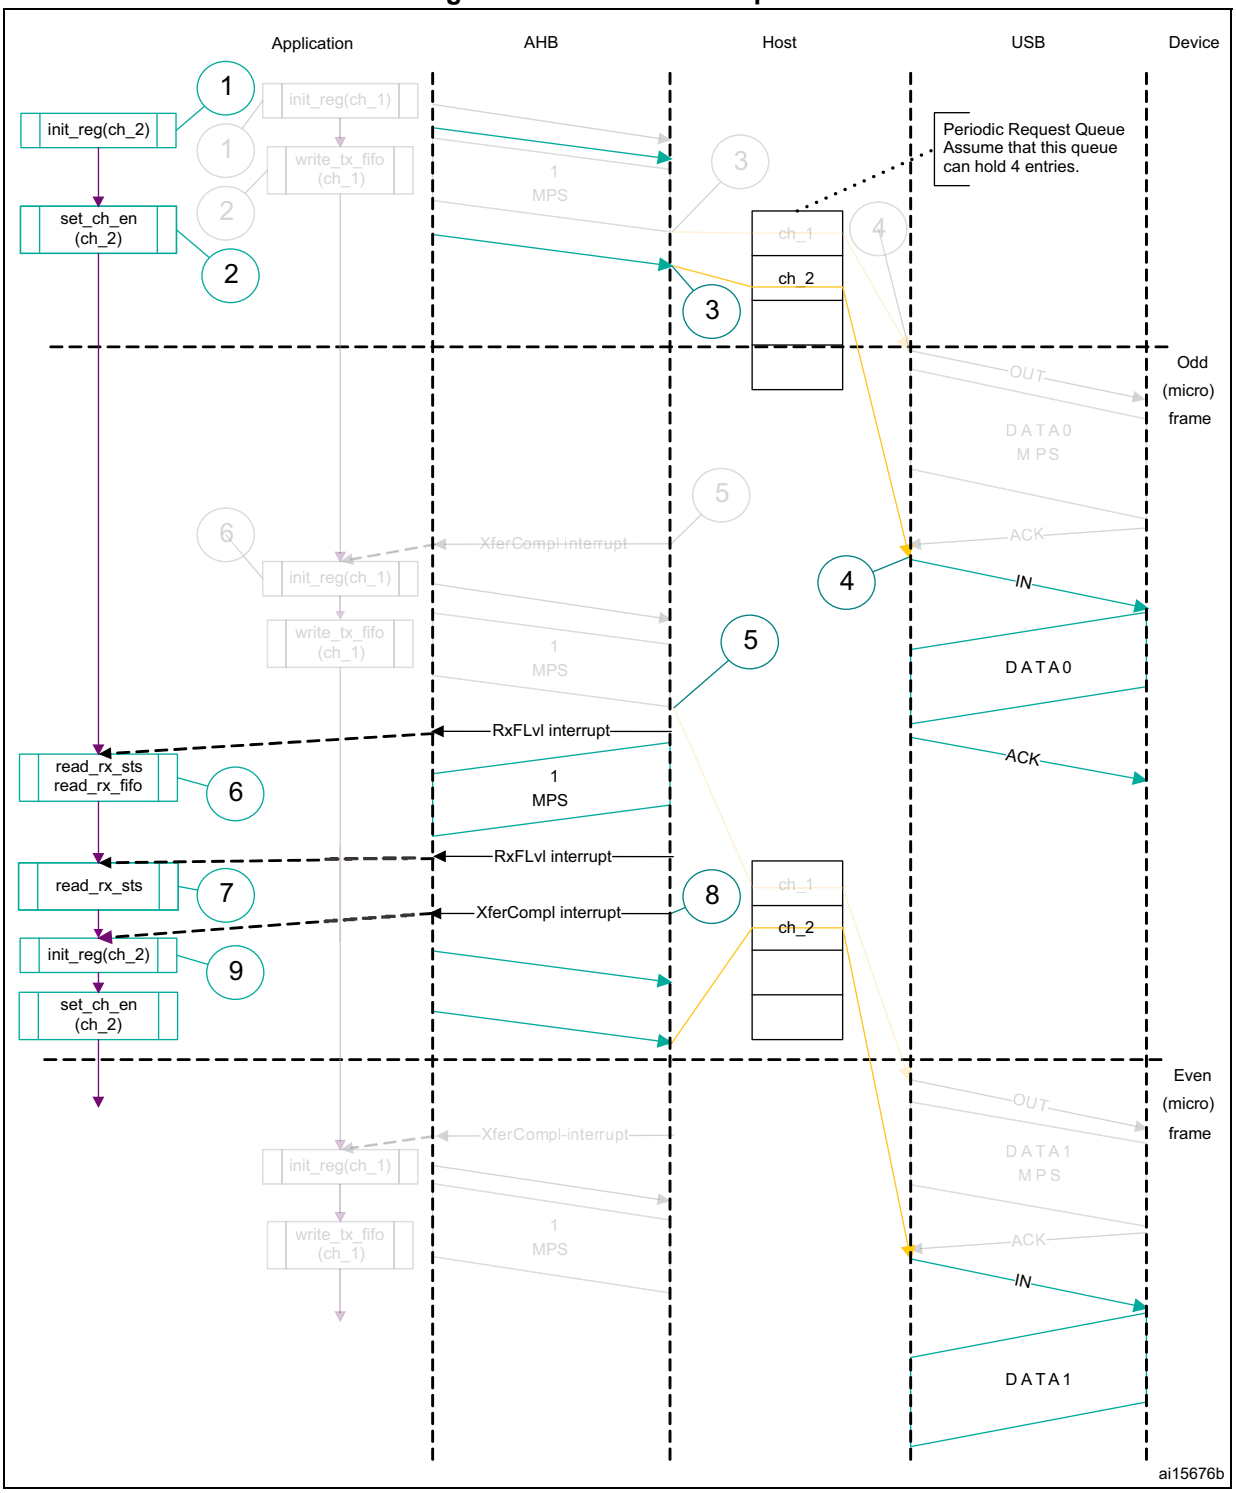
- **Normal interrupt IN operation**

  The sequence of operations is as follows:

1. Initialize channel 2. The application must set the ODDFRM bit in OTG_HCCHAR2.
2. Set the CHENA bit in OTG_HCCHAR2 to write an IN request to the periodic request queue.
3. The OTG host writes an IN request to the periodic request queue for each OTG_HCCHAR2 register write with the CHENA bit set.
4. The OTG host attempts to send an IN token in the next (odd) frame.
5. As soon as the IN packet is received and written to the receive FIFO, the OTG host generates an RXFLVL interrupt.
6. In response to the RXFLVL interrupt, read the received packet status to determine the number of bytes received, then read the receive FIFO accordingly. The application must mask the RXFLVL interrupt before reading the receive FIFO, and unmask after reading the entire packet.
7. The core generates the RXFLVL interrupt for the transfer completion status entry in the receive FIFO. The application must read and ignore the receive packet status when the receive packet status is not an IN data packet (PKTSTS in GRXSTSR ≠ 0b0010).
8. The core generates an XFRC interrupt as soon as the receive packet status is read.
9. In response to the XFRC interrupt, read the PKTCNT field in OTG_HCTSIZ2. If the PKTCNT bit in OTG_HCTSIZ2 is not equal to 0, disable the channel before re-

initializing the channel for the next transfer, if any). If PKTCNT bit in OTG_HCTSIZ2 = 0, reinitialize the channel for the next transfer. This time, the application must reset the ODDFRM bit in OTG_HCCHAR2.

**Figure 751. Normal interrupt IN**



1. The grayed elements are not relevant in the context of this figure.

- **Isochronous OUT transactions**

  A typical isochronous OUT operation is shown in *Figure 751*. The assumptions are:

  – The application is attempting to send one packet every frame (up to 1 maximum

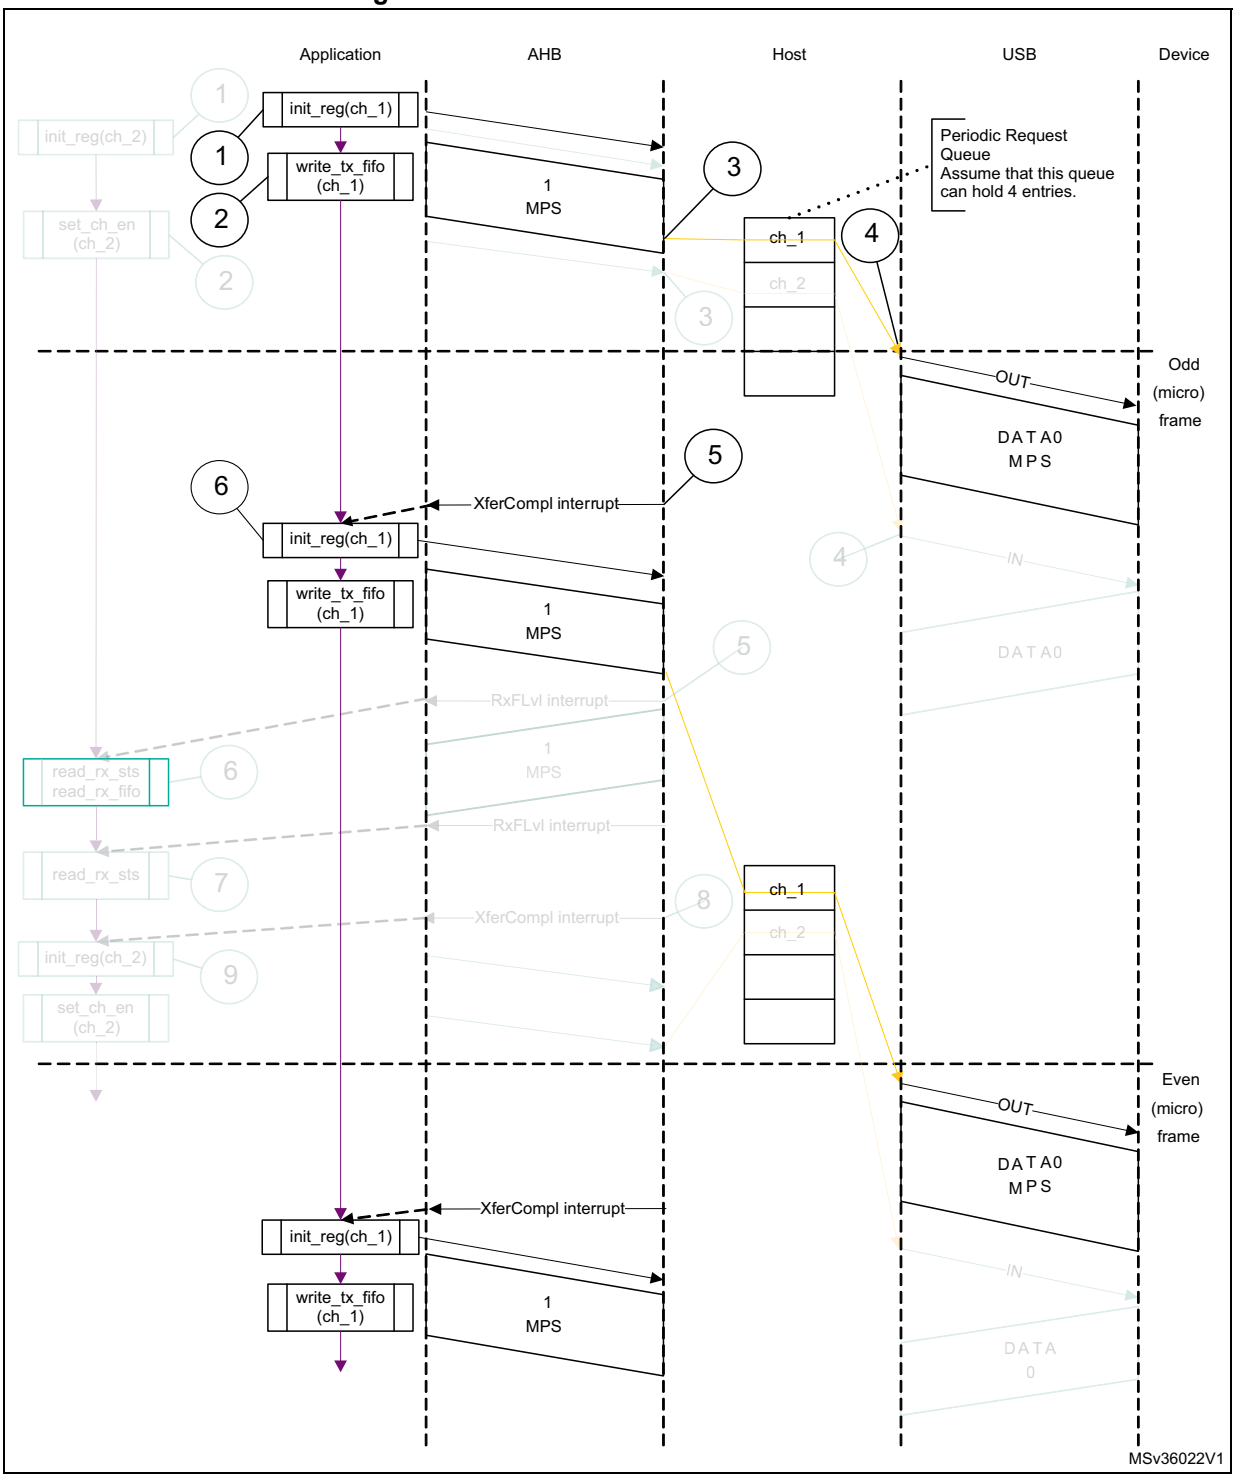
packet size), starting with an odd frame. (transfer size = 1 024 bytes).

– The periodic transmit FIFO can hold one packet (1 KB).
– Periodic request queue depth = 4.

The sequence of operations is as follows:

1. Initialize and enable channel 1. The application must set the ODDFRM bit in OTG_HCCHAR1.
2. Write the first packet for channel 1.
3. Along with the last word write of each packet, the OTG host writes an entry to the periodic request queue.
4. The OTG host attempts to send the OUT token in the next frame (odd).
5. The OTG host generates the XFRC interrupt as soon as the last packet is transmitted successfully.
6. In response to the XFRC interrupt, reinitialize the channel for the next transfer.
7. Handling non-ACK responses

**Figure 752. Isochronous OUT transactions**



1. The grayed elements are not relevant in the context of this figure.

```

- **Isochronous IN transactions**

  The assumptions are:

  – The application is attempting to receive one packet (up to 1 maximum packet size) in every frame starting with the next odd frame (transfer size = 1 024 bytes).

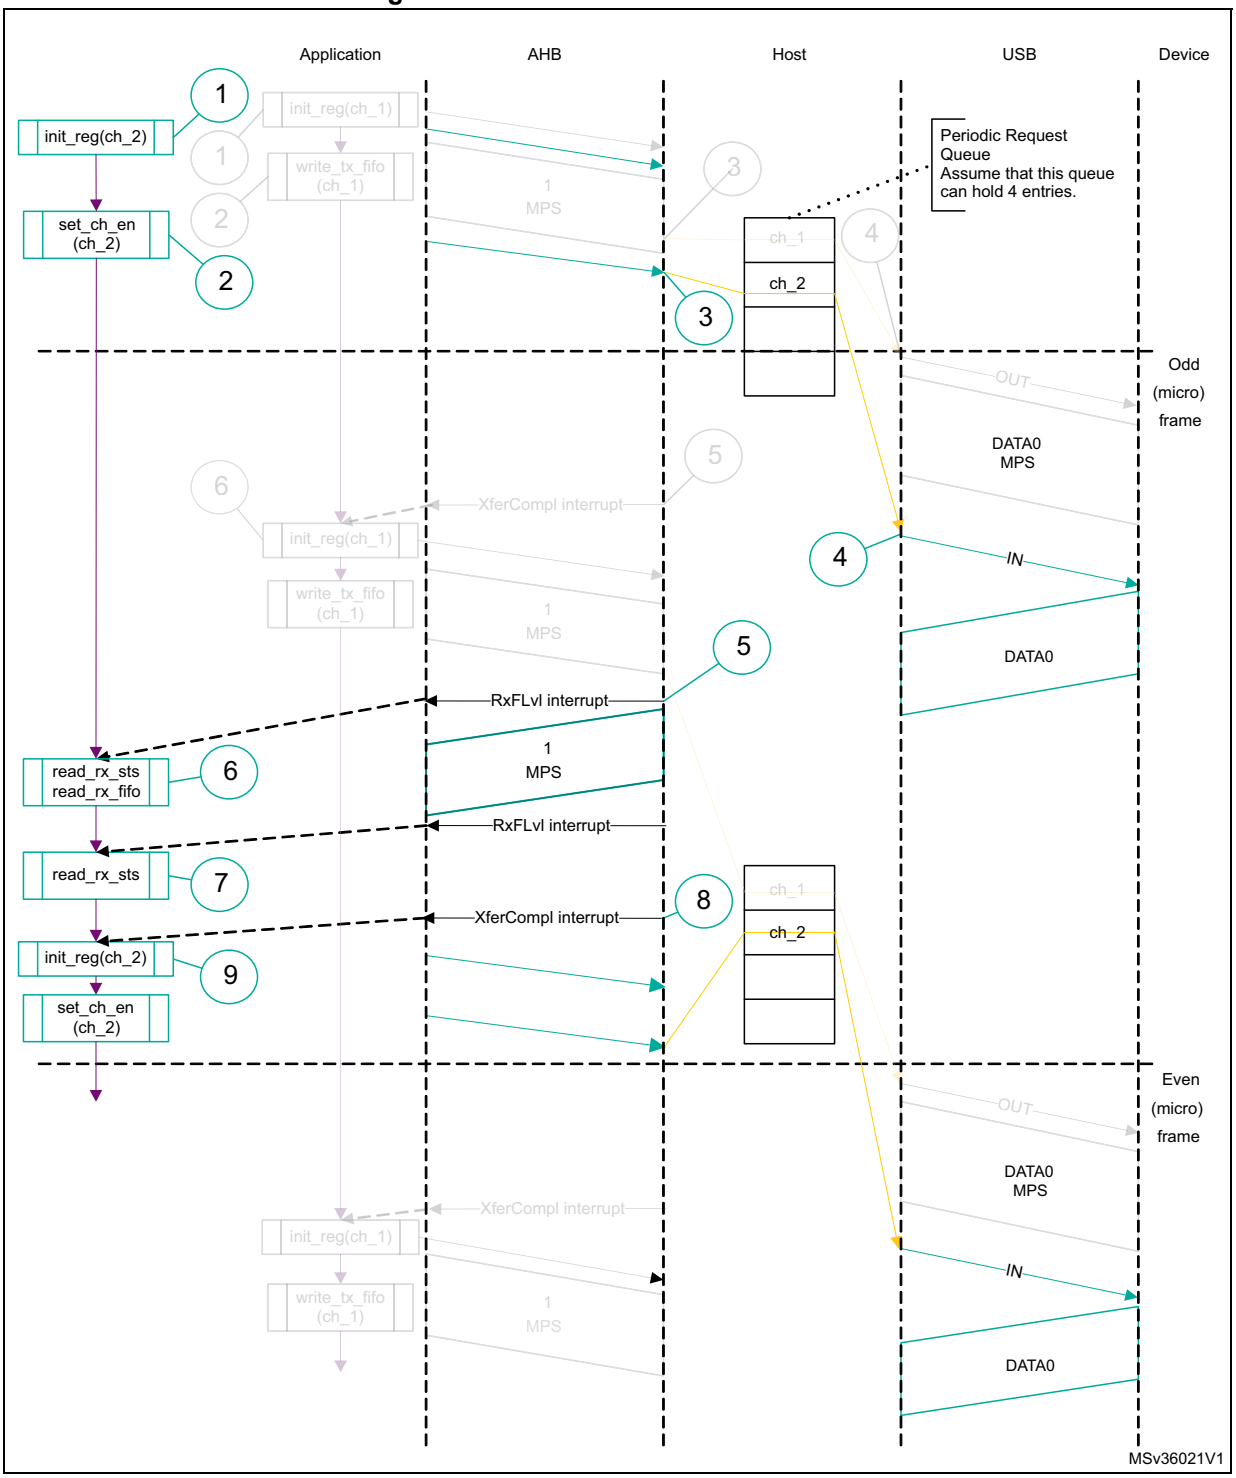
  – The receive FIFO can hold at least one maximum-packet-size packet and two status word per packet (1 031 bytes).

  – Periodic request queue depth = 4.

  The sequence of operations is as follows:

1. Initialize channel 2. The application must set the ODDFRM bit in OTG_HCCHAR2.
2. Set the CHENA bit in OTG_HCCHAR2 to write an IN request to the periodic request queue.
3. The OTG host writes an IN request to the periodic request queue for each OTG_HCCHAR2 register write with the CHENA bit set.
4. The OTG host attempts to send an IN token in the next odd frame.
5. As soon as the IN packet is received and written to the receive FIFO, the OTG host generates an RXFLVL interrupt.
6. In response to the RXFLVL interrupt, read the received packet status to determine the number of bytes received, then read the receive FIFO accordingly. The application must mask the RXFLVL interrupt before reading the receive FIFO, and unmask it after reading the entire packet.
7. The core generates an RXFLVL interrupt for the transfer completion status entry in the receive FIFO. This time, the application must read and ignore the receive packet status when the receive packet status is not an IN data packet (PKTSTS bit in OTG_GRXSTSR ≠ 0b0010).
8. The core generates an XFRC interrupt as soon as the receive packet status is read.
9. In response to the XFRC interrupt, read the PKTCNT field in OTG_HCTSIZ2. If PKTCNT ≠ 0 in OTG_HCTSIZ2, disable the channel before re-initializing the channel for the next transfer, if any. If PKTCNT = 0 in OTG_HCTSIZ2, reinitialize the channel for the next transfer. This time, the application must reset the ODDFRM bit in OTG_HCCHAR2.

**Figure 753. Isochronous IN transactions**



1. The grayed elements are not relevant in the context of this figure.

- **Selecting the queue depth**

  Choose the periodic and non-periodic request queue depths carefully to match the number of periodic/non-periodic endpoints accessed.

  The non-periodic request queue depth affects the performance of non-periodic

transfers. The deeper the queue (along with sufficient FIFO size), the more often the core is able to pipeline non-periodic transfers. If the queue size is small, the core is able to put in new requests only when the queue space is freed up.

The core's periodic request queue depth is critical to perform periodic transfers as scheduled. Select the periodic queue depth, based on the number of periodic transfers scheduled in a microframe. If the periodic request queue depth is smaller than the periodic transfers scheduled in a microframe, a frame overrun condition occurs.

- **Handling babble conditions**

  OTG controller handles two cases of babble: packet babble and port babble. Packet babble occurs if the device sends more data than the maximum packet size for the channel. Port babble occurs if the core continues to receive data from the device at EOF2 (the end of frame 2, which is very close to SOF).

  When OTG controller detects a packet babble, it stops writing data into the Rx buffer and waits for the end of packet (EOP). When it detects an EOP, it flushes already written data in the Rx buffer and generates a Babble interrupt to the application.

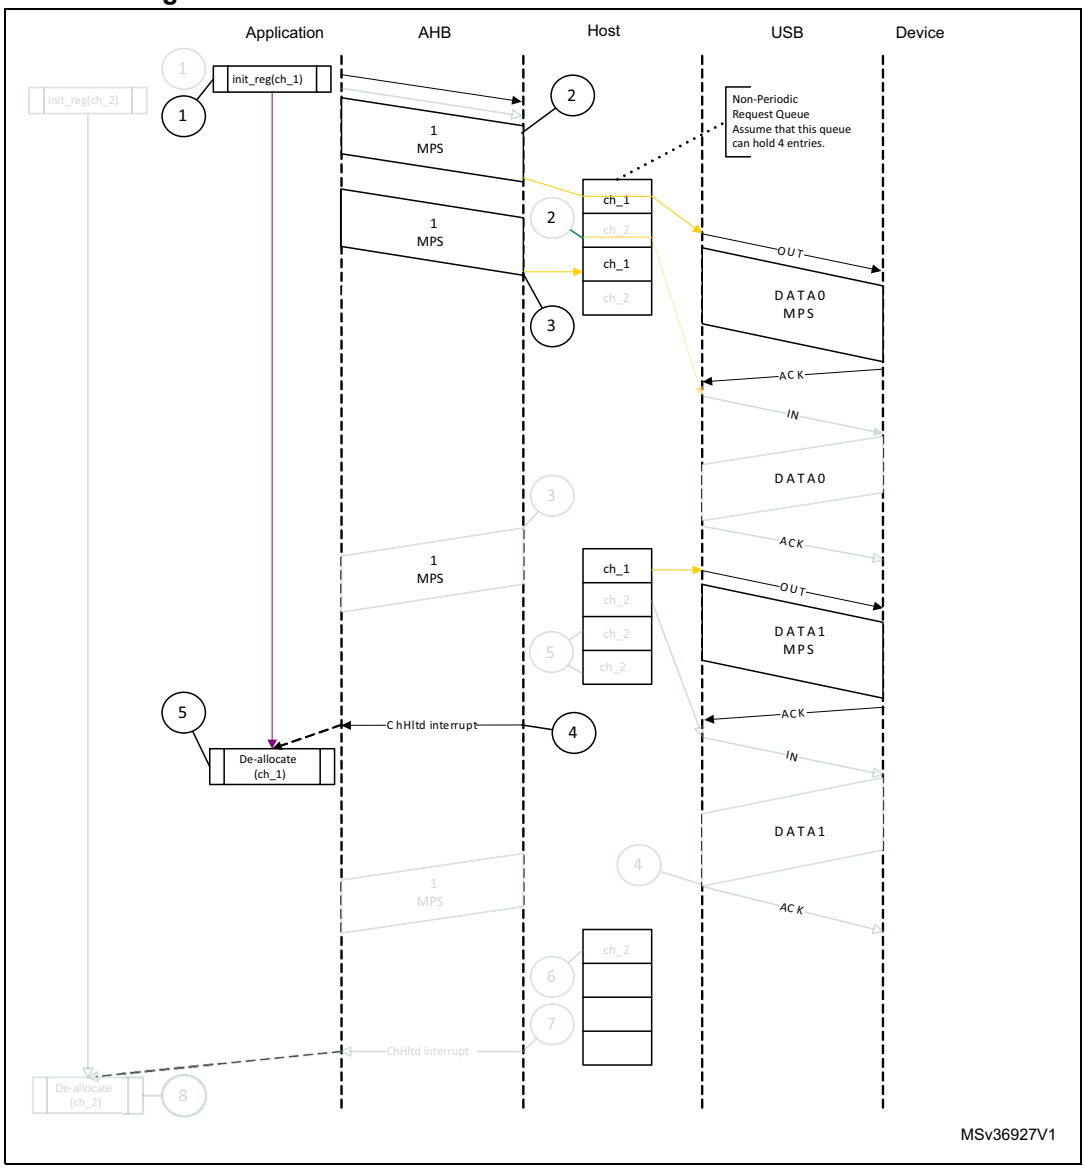
  When OTG controller detects a port babble, it flushes the Rx FIFO and disables the port. The core then generates a port disabled interrupt (HPRTINT in OTG_GINTSTS, PENCHNG in OTG_HPRT). On receiving this interrupt, the application must determine that this is not due to an overcurrent condition (another cause of the port disabled interrupt) by checking POCA in OTG_HPRT, then perform a soft reset. The core does not send any more tokens after it has detected a port babble condition.

- **Bulk and control OUT/SETUP transactions in DMA mode**

  The sequence of operations is as follows:

1. Initialize and enable channel 1 as explained in *Section : Channel initialization*.
2. The OTG host starts fetching the first packet as soon as the channel is enabled. For internal DMA mode, the OTG host uses the programmed DMA address to fetch the packet.
3. After fetching the last 32-bit word of the second (last) packet, the OTG host masks channel 1 internally for further arbitration.
4. The OTG host generates a CHH interrupt as soon as the last packet is sent.
5. In response to the CHH interrupt, de-allocate the channel for other transfers.

**Figure 754. Normal bulk/control OUT/SETUP transactions - DMA**



- **NAK and NYET handling with internal DMA:**

1. The OTG host sends a bulk OUT transaction.
2. The device responds with NAK or NYET.
3. If the application has unmasked NAK or NYET, the core generates the corresponding interrupt(s) to the application. The application is not required to service these interrupts, since the core takes care of rewinding the buffer pointers and re-initializing the Channel without application intervention.
4. The core automatically issues a ping token.
5. When the device returns an ACK, the core continues with the transfer. Optionally, the application can utilize these interrupts, in which case the NAK or NYET interrupt is masked by the application.

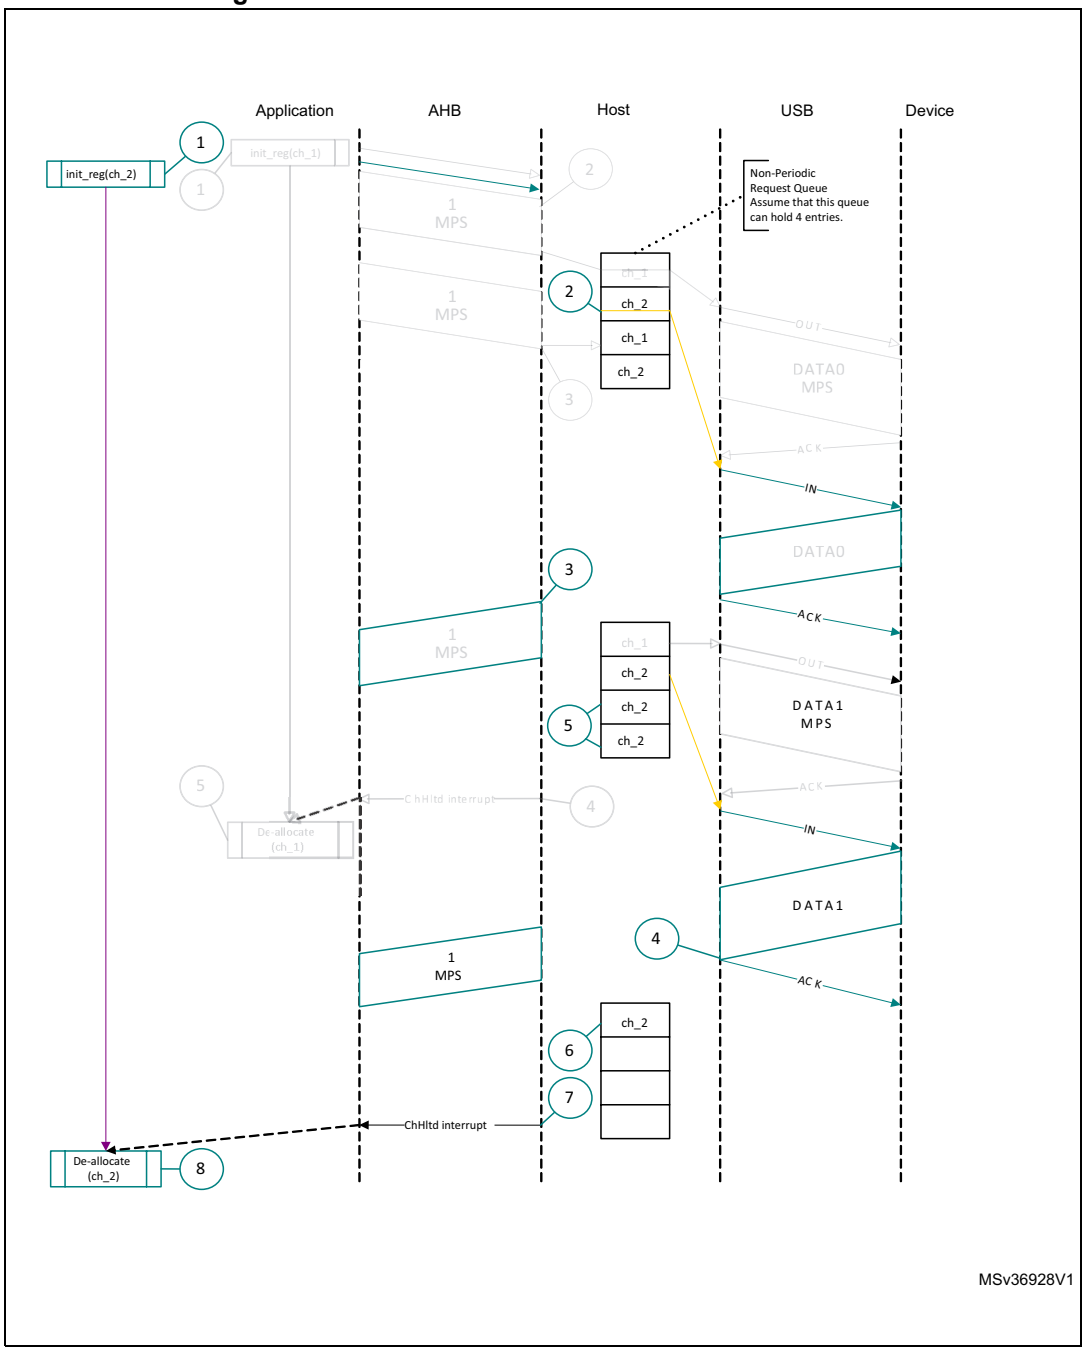
The core does not generate a separate interrupt when NAK or NYET is received by the host functionality.

- **Bulk and control IN transactions in DMA mode**

  The sequence of operations is as follows:

1. Initialize and enable the used channel (channel x) as explained in *Section : Channel initialization*.
2. The OTG host writes an IN request to the request queue as soon as the channel receives the grant from the arbiter (arbitration is performed in a round-robin fashion).
3. The OTG host starts writing the received data to the system memory as soon as the last byte is received with no errors.
4. When the last packet is received, the OTG host sets an internal flag to remove any extra IN requests from the request queue.
5. The OTG host flushes the extra requests.
6. The final request to disable channel x is written to the request queue. At this point, channel 2 is internally masked for further arbitration.
7. The OTG host generates the CHH interrupt as soon as the disable request comes to the top of the queue.
8. In response to the CHH interrupt, de-allocate the channel for other transfers.

**Figure 755. Normal bulk/control IN transaction - DMA**

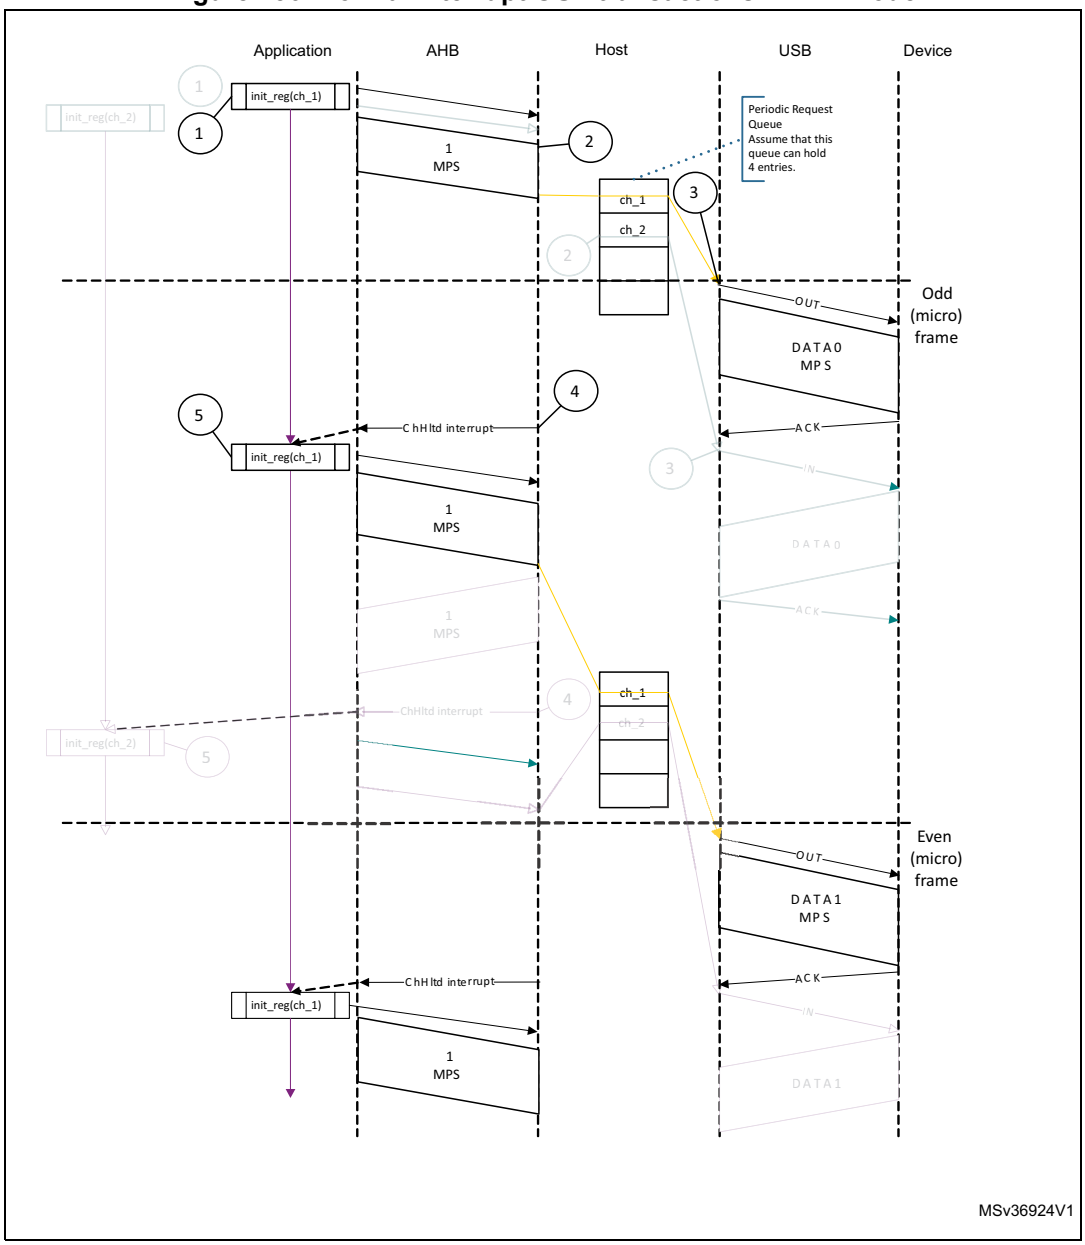


- **Interrupt OUT transactions in DMA mode**

1. Initialize and enable channel x as explained in *Section : Channel initialization*.
2. The OTG host starts fetching the first packet as soon the channel is enabled and writes the OUT request along with the last 32-bit word fetch. In high-bandwidth transfers, the OTG host continues fetching the next packet (up to the value specified in the MC field) before switching to the next channel.
3. The OTG host attempts to send the OUT token at the beginning of the next odd frame/micro-frame.

4. After successfully transmitting the packet, the OTG host generates a CHH interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 756. Normal interrupt OUT transactions - DMA mode**



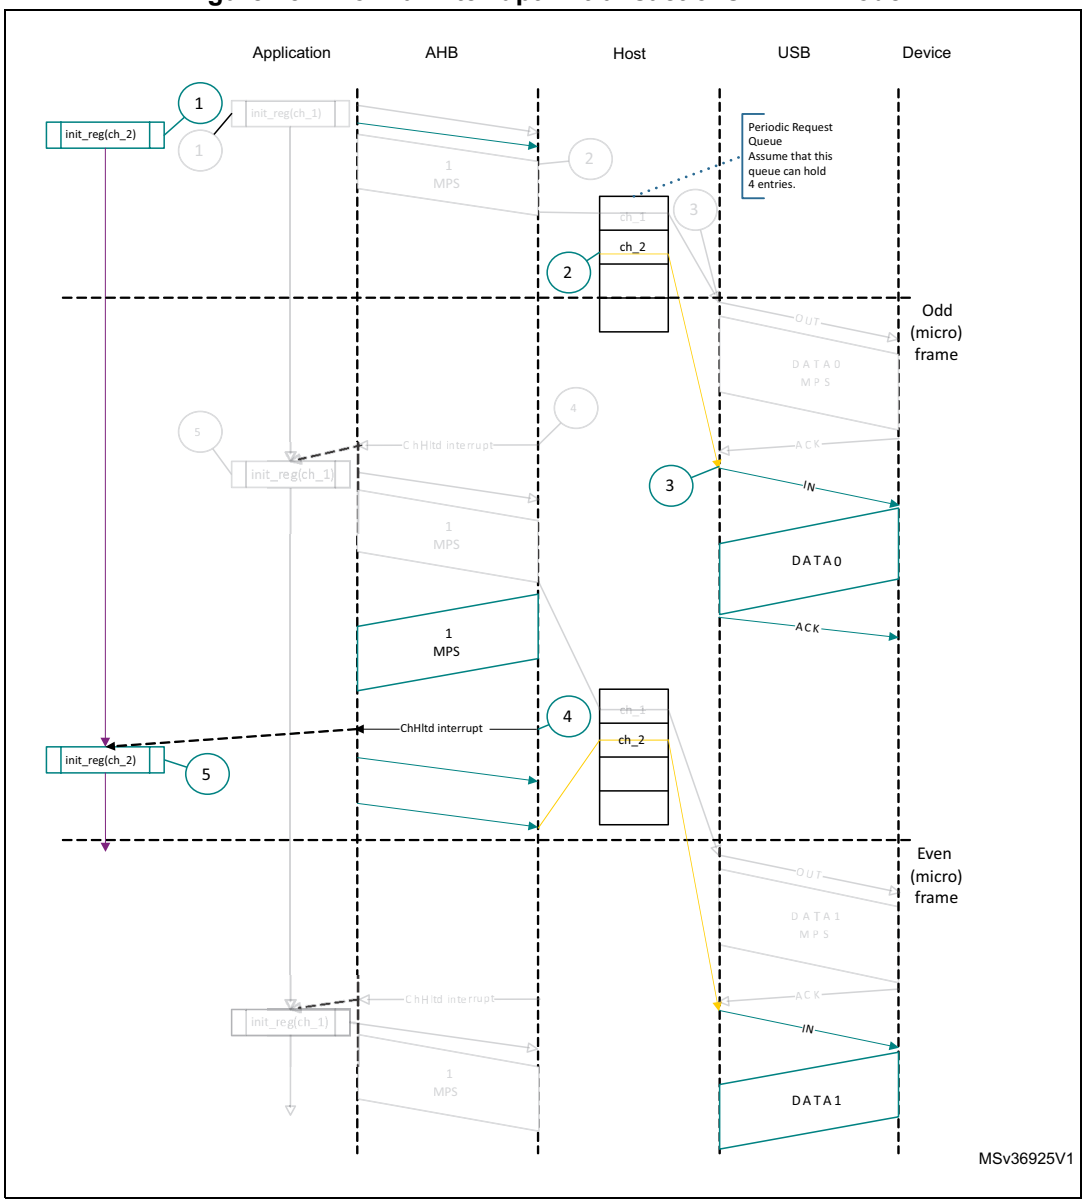
- **Interrupt IN transactions in DMA mode**

  The sequence of operations (channelx) is as follows:

1. Initialize and enable channel x as explained in *Section : Channel initialization*.
2. The OTG host writes an IN request to the request queue as soon as the channel x gets the grant from the arbiter (round-robin with fairness). In high-bandwidth transfers, the OTG host writes consecutive writes up to MC times.
3. The OTG host attempts to send an IN token at the beginning of the next (odd) frame/micro-frame.

4. As soon the packet is received and written to the receive FIFO, the OTG host generates a CHH interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 757. Normal interrupt IN transactions - DMA mode**



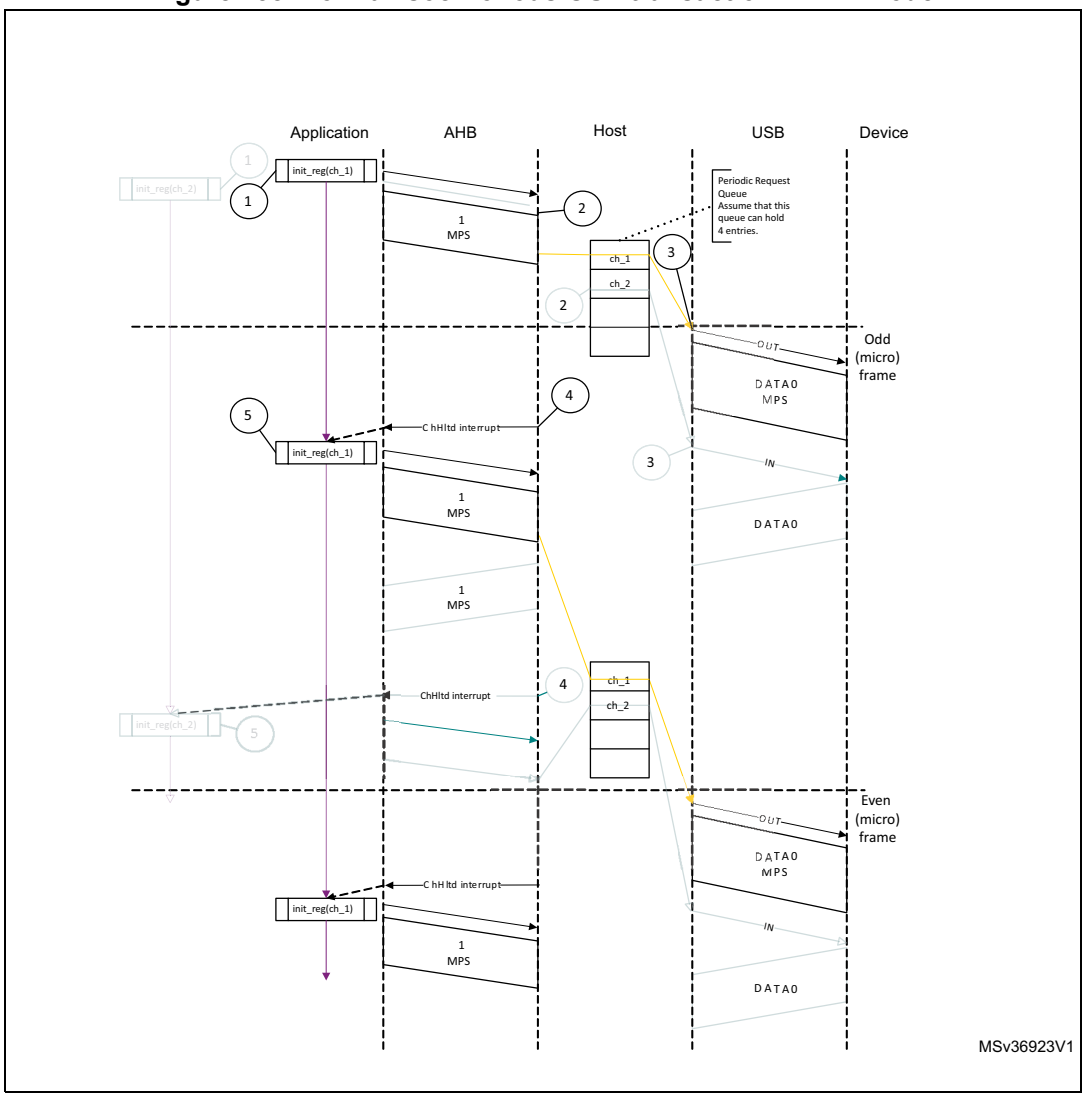
- **Isochronous OUT transactions in DMA mode**

1. Initialize and enable channel x as explained in *Section : Channel initialization*.
2. The OTG host starts fetching the first packet as soon as the channel is enabled, and writes the OUT request along with the last 32-bit word fetch. In high-bandwidth

transfers, the OTG host continues fetching the next packet (up to the value specified in the MC field) before switching to the next channel.

3. The OTG host attempts to send an OUT token at the beginning of the next (odd) frame/micro-frame.
4. After successfully transmitting the packet, the OTG host generates a CHH interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 758. Normal isochronous OUT transaction - DMA mode**



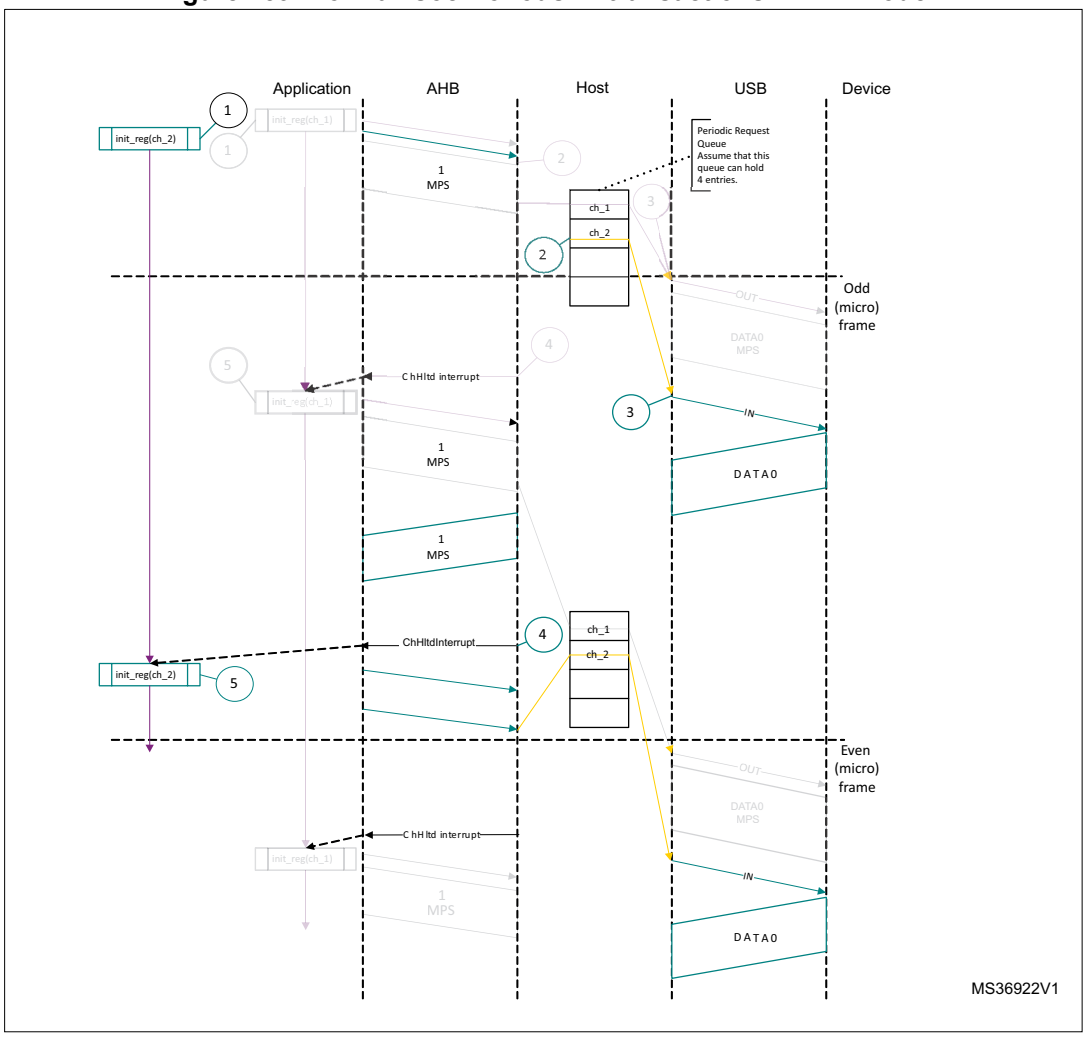
- **Isochronous IN transactions in DMA mode**

The sequence of operations ((channel x) is as follows:

1. Initialize and enable channel x as explained in *Section : Channel initialization*.
2. The OTG host writes an IN request to the request queue as soon as the channel x gets the grant from the arbiter (round-robin with fairness). In high-bandwidth transfers, the OTG host performs consecutive write operations up to MC times.
3. The OTG host attempts to send an IN token at the beginning of the next (odd) frame/micro-frame.

4. As soon the packet is received and written to the receive FIFO, the OTG host generates a CHH interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 759. Normal isochronous IN transactions - DMA mode**



- **Bulk and control OUT/SETUP split transactions in DMA mode**

The sequence of operations in (channel x) is as follows:

1. Initialize and enable channel x for start split as explained in *Section : Channel initialization*.
2. The OTG host starts fetching the first packet as soon the channel is enabled and writes the OUT request along with the last 32-bit word fetch.
3. After successfully transmitting start split, the OTG host generates the CHH interrupt.
4. In response to the CHH interrupt, set the COMPLSPLT bit in OTG_HCSPLT1 to send the complete split.
5. After successfully transmitting complete split, the OTG host generates the CHH interrupt.

6. In response to the CHH interrupt, de-allocate the channel.

- **Bulk/control IN split transactions in DMA mode**

The sequence of operations (channel x) is as follows:

1. Initialize and enable channel x as explained in *Section : Channel initialization*.
2. The OTG host writes the start split request to the nonperiodic request after getting the grant from the arbiter. The OTG host masks the channel x internally for the arbitration after writing the request.
3. As soon as the IN token is transmitted, the OTG host generates the CHH interrupt.
4. In response to the CHH interrupt, set the COMPLSPLT bit in OTG_HCSPLT2 and re-enable the channel to send the complete split token. This unmasks channel x for arbitration.
5. The OTG host writes the complete split request to the nonperiodic request after receiving the grant from the arbiter.
6. The OTG host starts writing the packet to the system memory after receiving the packet successfully.
7. As soon as the received packet is written to the system memory, the OTG host generates a CHH interrupt.
8. In response to the CHH interrupt, de-allocate the channel.

- **Interrupt OUT split transactions in DMA mode**

The sequence of operations in (channel x) is as follows:

1. Initialize and enable channel 1 for start split as explained in *Section : Channel initialization*. The application must set the ODDFRM bit in OTG_HCCHAR1.
2. The OTG host starts reading the packet.
3. The OTG host attempts to send the start split transaction.
4. After successfully transmitting the start split, the OTG host generates the CHH interrupt.
5. In response to the CHH interrupt, set the COMPLSPLT bit in OTG_HCSPLT1 to send the complete split.
6. After successfully completing the complete split transaction, the OTG host generates the CHH interrupt.
7. In response to CHH interrupt, de-allocate the channel.

- **Interrupt IN split transactions in DMA mode**

The sequence of operations in (channel x) is as follows:

1. Initialize and enable channel x for start split as explained in *Section : Channel initialization*.
2. The OTG host writes an IN request to the request queue as soon as channel x receives the grant from the arbiter.
3. The OTG host attempts to send the start split IN token at the beginning of the next odd micro-frame.
4. The OTG host generates the CHH interrupt after successfully transmitting the start split IN token.
5. In response to the CHH interrupt, set the COMPLSPLT bit in OTG_HCSPLT2 to send the complete split.

6. As soon as the packet is received successfully, the OTG host starts writing the data to the system memory.
7. The OTG host generates the CHH interrupt after transferring the received data to the system memory.
8. In response to the CHH interrupt, de-allocate or reinitialize the channel for the next start split.

- **Isochronous OUT split transactions in DMA mode**

The sequence of operations (channel x) is as follows:

1. Initialize and enable channel x for start split (begin) as explained in *Section : Channel initialization*. The application must set the ODDFRM bit in OTG_HCCHAR1. Program the MPS field.
2. The OTG host starts reading the packet.
3. After successfully transmitting the start split (begin), the OTG host generates the CHH interrupt.
4. In response to the CHH interrupt, reinitialize the registers to send the start split (end).
5. After successfully transmitting the start split (end), the OTG host generates a CHH interrupt.
6. In response to the CHH interrupt, de-allocate the channel.

- **Isochronous IN split transactions in DMA mode**

The sequence of operations (channel x) is as follows:

1. Initialize and enable channel x for start split as explained in *Section : Channel initialization*.
2. The OTG host writes an IN request to the request queue as soon as channel x receives the grant from the arbiter.
3. The OTG host attempts to send the start split IN token at the beginning of the next odd micro-frame.
4. The OTG host generates the CHH interrupt after successfully transmitting the start split IN token.
5. In response to the CHH interrupt, set the COMPLSPLT bit in OTG_HCSPLT2 to send the complete split.
6. As soon as the packet is received successfully, the OTG host starts writing the data to the system memory.

   The OTG host generates the CHH interrupt after transferring the received data to the system memory. In response to the CHH interrupt, de-allocate the channel or reinitialize the channel for the next start split.

### 60.15.6 Device programming model

#### Endpoint initialization on USB reset

1. Set the NAK bit for all OUT endpoints
   – SNAK = 1 in OTG_DOEPCTLx (for all OUT endpoints)
2. Unmask the following interrupt bits
   – INEP0 = 1 in OTG_DAINTMSK (control 0 IN endpoint)
   – OUTEP0 = 1 in OTG_DAINTMSK (control 0 OUT endpoint)
   – STUPM = 1 in OTG_DOEPMSK
   – XFRCM = 1 in OTG_DOEPMSK
   – XFRCM = 1 in OTG_DIEPMSK
   – TOM = 1 in OTG_DIEPMSK
3. Set up the data FIFO RAM for each of the FIFOs
   – Program the OTG_GRXFSIZ register, to be able to receive control OUT data and setup data. If thresholding is not enabled, at a minimum, this must be equal to 1 max packet size of control endpoint 0 + 2 words (for the status of the control OUT data packet) + 10 words (for setup packets).
   – Program the OTG_DIEPTXF0 register (depending on the FIFO number chosen) to be able to transmit control IN data. At a minimum, this must be equal to 1 max packet size of control endpoint 0.
4. Program the following fields in the endpoint-specific registers for control OUT endpoint 0 to receive a SETUP packet
   – STUPCNT = 3 in OTG_DOEPTSIZ0 (to receive up to 3 back-to-back SETUP packets)
5. For USB OTG in DMA mode, the OTG_DOEPDMA0 register should have a valid memory address to store any SETUP packets received.

At this point, all initialization required to receive SETUP packets is done.

#### Endpoint initialization on enumeration completion

1. On the Enumeration Done interrupt (ENUMDNE in OTG_GINTSTS), read the OTG_DSTS register to determine the enumeration speed.
2. Program the MPSIZ field in OTG_DIEPCTL0 to set the maximum packet size. This step configures control endpoint 0. The maximum packet size for a control endpoint depends on the enumeration speed.
3. For USB OTG in DMA mode, program the OTG_DOEPCTL0 register to enable control OUT endpoint 0, to receive a SETUP packet.

At this point, the device is ready to receive SOF packets and is configured to perform control transfers on control endpoint 0.

#### Endpoint initialization on SetAddress command

This section describes what the application must do when it receives a SetAddress command in a SETUP packet.

1. Program the OTG_DCFG register with the device address received in the SetAddress command
2. Program the core to send out a status IN packet

### Endpoint initialization on SetConfiguration/SetInterface command

This section describes what the application must do when it receives a SetConfiguration or SetInterface command in a SETUP packet.

1. When a SetConfiguration command is received, the application must program the endpoint registers to configure them with the characteristics of the valid endpoints in the new configuration.
2. When a SetInterface command is received, the application must program the endpoint registers of the endpoints affected by this command.
3. Some endpoints that were active in the prior configuration or alternate setting are not valid in the new configuration or alternate setting. These invalid endpoints must be deactivated.
4. Unmask the interrupt for each active endpoint and mask the interrupts for all inactive endpoints in the OTG_DAINTMSK register.
5. Set up the data FIFO RAM for each FIFO.
6. After all required endpoints are configured; the application must program the core to send a status IN packet.

At this point, the device core is configured to receive and transmit any type of data packet.

### Endpoint activation

This section describes the steps required to activate a device endpoint or to configure an existing device endpoint to a new type.

1. Program the characteristics of the required endpoint into the following fields of the OTG_DIEPCTLx register (for IN or bidirectional endpoints) or the OTG_DOEPCTLx register (for OUT or bidirectional endpoints).
   - Maximum packet size
   - USB active endpoint = 1
   - Endpoint start data toggle (for interrupt and bulk endpoints)
   - Endpoint type
   - Tx FIFO number
2. Once the endpoint is activated, the core starts decoding the tokens addressed to that endpoint and sends out a valid handshake for each valid token received for the endpoint.

### Endpoint deactivation

This section describes the steps required to deactivate an existing endpoint.

1. In the endpoint to be deactivated, clear the USB active endpoint bit in the OTG_DIEPCTLx register (for IN or bidirectional endpoints) or the OTG_DOEPCTLx register (for OUT or bidirectional endpoints).
2. Once the endpoint is deactivated, the core ignores tokens addressed to that endpoint, which results in a timeout on the USB.

*Note: The application must meet the following conditions to set up the device core to handle traffic:*
*NPTXFEM and RXFLVLM in the OTG_GINTMSK register must be cleared.*

### Operational model

SETUP and OUT data transfers:

This section describes the internal data flow and application-level operations during data OUT transfers and SETUP transactions.

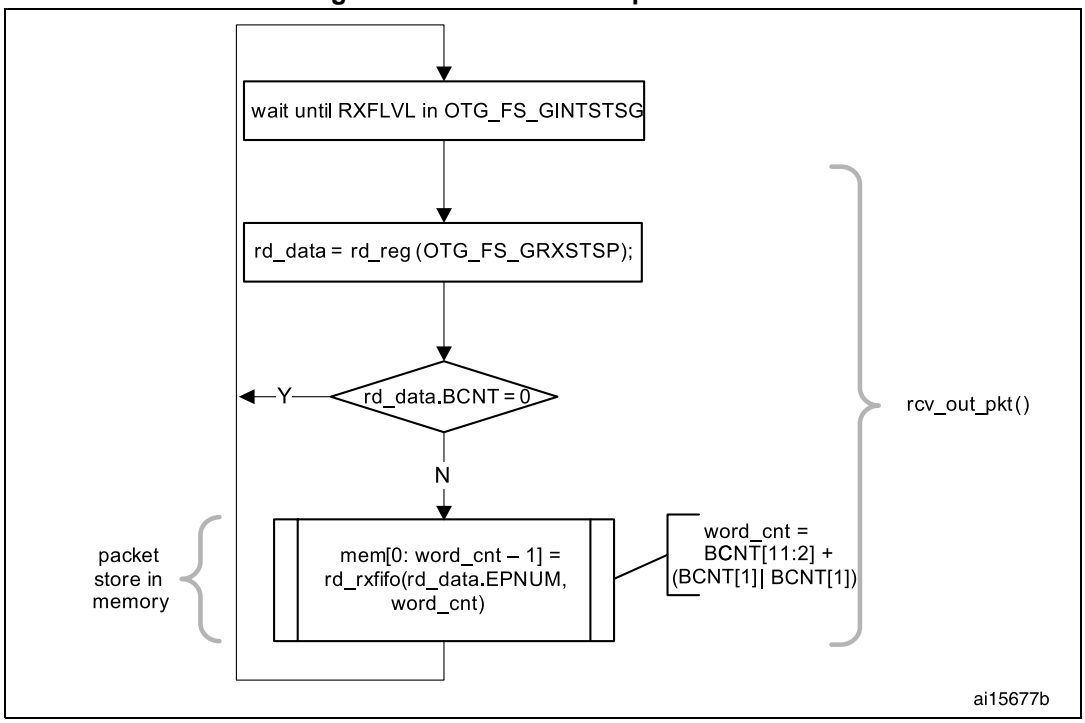
- **Packet read**

This section describes how to read packets (OUT data and SETUP packets) from the receive FIFO.

1. On catching an RXFLVL interrupt (OTG_GINTSTS register), the application must read the receive status pop register (OTG_GRXSTSP).
2. The application can mask the RXFLVL interrupt (in OTG_GINTSTS) by writing to RXFLVLM = 0 (in OTG_GINTMSK), until it has read the packet from the receive FIFO.
3. If the received packet's byte count is not 0, the byte count amount of data is popped from the receive data FIFO and stored in memory. If the received packet byte count is 0, no data is popped from the receive data FIFO.
4. The receive status readout of the packet of FIFO indicates one of the following:
   a) Global OUT NAK pattern:
   PKTSTS = Global OUT NAK, BCNT = 0x000, EPNUM = (0x0),
   DPID = (0b00).
   These data indicate that the global OUT NAK bit has taken effect.
   b) SETUP packet pattern:
   PKTSTS = SETUP, BCNT = 0x008, EPNUM = Control EP Num,
   DPID = DATA0. These data indicate that a SETUP packet for the specified endpoint is now available for reading from the receive FIFO.
   c) Setup stage done pattern:
   PKTSTS = Setup Stage Done, BCNT = 0x0, EPNUM = Control EP Num,
   DPID = (0b00).
   These data indicate that the setup stage for the specified endpoint has completed and the data stage has started. After this entry is popped from the receive FIFO, the core asserts a setup interrupt on the specified control OUT endpoint.
   d) Data OUT packet pattern:
   PKTSTS = DataOUT, BCNT = size of the received data OUT packet (0 ≤ BCNT ≤ 1 024), EPNUM = EPNUM on which the packet was received, DPID = Actual Data PID.
   e) Data transfer completed pattern:
   PKTSTS = Data OUT transfer done, BCNT = 0x0, EPNUM = OUT EP Num on which the data transfer is complete, DPID = (0b00).
   These data indicate that an OUT data transfer for the specified OUT endpoint has completed. After this entry is popped from the receive FIFO, the core asserts a transfer completed interrupt on the specified OUT endpoint.
5. After the data payload is popped from the receive FIFO, the RXFLVL interrupt (OTG_GINTSTS) must be unmasked.
6. Steps 1–5 are repeated every time the application detects assertion of the interrupt line due to RXFLVL in OTG_GINTSTS. Reading an empty receive FIFO can result in undefined core behavior.

*Figure 760* provides a flowchart of the above procedure.

**Figure 760. Receive FIFO packet read**



### SETUP transactions

This section describes how the core handles SETUP packets and the application's sequence for handling SETUP transactions.

- **Application requirements**

1. To receive a SETUP packet, the STUPCNT field (OTG_DOEPTSIZx) in a control OUT endpoint must be programmed to a non-zero value. When the application programs the STUPCNT field to a non-zero value, the core receives SETUP packets and writes them to the receive FIFO, irrespective of the NAK status and EPENA bit setting in OTG_DOEPCTLx. The STUPCNT field is decremented every time the control endpoint receives a SETUP packet. If the STUPCNT field is not programmed to a proper value before receiving a SETUP packet, the core still receives the SETUP packet and decrements the STUPCNT field, but the application may not be able to determine the correct number of SETUP packets received in the setup stage of a control transfer.
   – STUPCNT = 3 in OTG_DOEPTSIZx
2. The application must always allocate some extra space in the receive data FIFO, to be able to receive up to three SETUP packets on a control endpoint.
   – The space to be reserved is 10 words. Three words are required for the first SETUP packet, 1 word is required for the setup stage done word and 6 words are required to store two extra SETUP packets among all control endpoints.
   – 3 words per SETUP packet are required to store 8 bytes of SETUP data and 4 bytes of SETUP status (setup packet pattern). The core reserves this space in the

receive data FIFO to write SETUP data only, and never uses this space for data packets.

3. The application must read the 2 words of the SETUP packet from the receive FIFO.
4. The application must read and discard the setup stage done word from the receive FIFO.

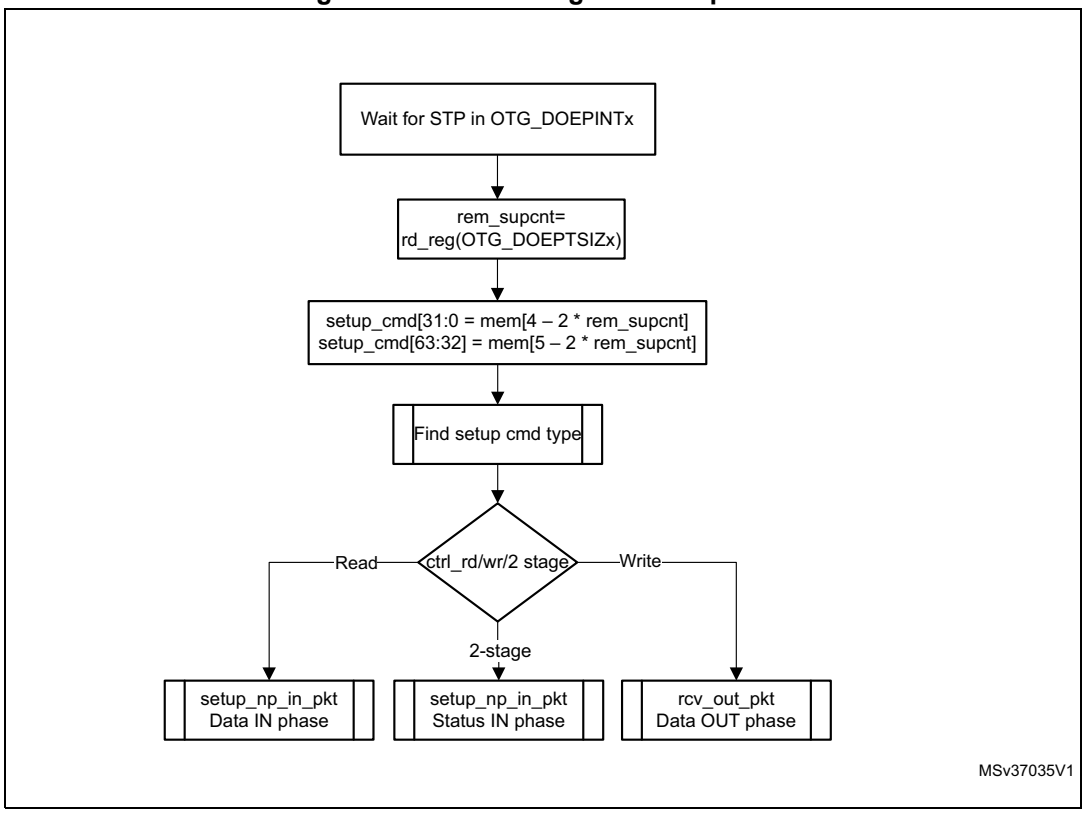
- **Internal data flow**

1. When a SETUP packet is received, the core writes the received data to the receive FIFO, without checking for available space in the receive FIFO and irrespective of the endpoint's NAK and STALL bit settings.
   – The core internally sets the IN NAK and OUT NAK bits for the control IN/OUT endpoints on which the SETUP packet was received.
2. For every SETUP packet received on the USB, 3 words of data are written to the receive FIFO, and the STUPCNT field is decremented by 1.
   – The first word contains control information used internally by the core
   – The second word contains the first 4 bytes of the SETUP command
   – The third word contains the last 4 bytes of the SETUP command
3. When the setup stage changes to a data IN/OUT stage, the core writes an entry (setup stage done word) to the receive FIFO, indicating the completion of the setup stage.
4. On the AHB side, SETUP packets are emptied by the application.
5. When the application pops the setup stage done word from the receive FIFO, the core interrupts the application with an STUP interrupt (OTG_DOEPINTx), indicating it can process the received SETUP packet.
6. The core clears the endpoint enable bit for control OUT endpoints.

- **Application programming sequence**

1. Program the OTG_DOEPTSIZx register.
   – STUPCNT = 3
2. Wait for the RXFLVL interrupt (OTG_GINTSTS) and empty the data packets from the receive FIFO.
3. Assertion of the STUP interrupt (OTG_DOEPINTx) marks a successful completion of the SETUP data transfer.
   – On this interrupt, the application must read the OTG_DOEPTSIZx register to determine the number of SETUP packets received and process the last received SETUP packet.

**Figure 761. Processing a SETUP packet**



- **Handling more than three back-to-back SETUP packets**

Per the USB 2.0 specification, normally, during a SETUP packet error, a host does not send more than three back-to-back SETUP packets to the same endpoint. However, the USB 2.0 specification does not limit the number of back-to-back SETUP packets a host can send to the same endpoint. When this condition occurs, the OTG controller generates an interrupt (B2BSTUP in OTG_DOEPINTx).

- **Setting the global OUT NAK**

Internal data flow:

1. When the application sets the Global OUT NAK (SGONAK bit in OTG_DCTL), the core stops writing data, except SETUP packets, to the receive FIFO. Irrespective of the space availability in the receive FIFO, non-isochronous OUT tokens receive a NAK handshake response, and the core ignores isochronous OUT data packets
2. The core writes the Global OUT NAK pattern to the receive FIFO. The application must reserve enough receive FIFO space to write this data pattern.
3. When the application pops the Global OUT NAK pattern word from the receive FIFO, the core sets the GONAKEFF interrupt (OTG_GINTSTS).
4. Once the application detects this interrupt, it can assume that the core is in Global OUT NAK mode. The application can clear this interrupt by clearing the SGONAK bit in OTG_DCTL.

Application programming sequence:

1. To stop receiving any kind of data in the receive FIFO, the application must set the Global OUT NAK bit by programming the following field:
   – SGONAK = 1 in OTG_DCTL
2. Wait for the assertion of the GONAKEFF interrupt in OTG_GINTSTS. When asserted, this interrupt indicates that the core has stopped receiving any type of data except SETUP packets.
3. The application can receive valid OUT packets after it has set SGONAK in OTG_DCTL and before the core asserts the GONAKEFF interrupt (OTG_GINTSTS).
4. The application can temporarily mask this interrupt by writing to the GONAKEFFM bit in the OTG_GINTMSK register.
   – GONAKEFFM = 0 in the OTG_GINTMSK register
5. Whenever the application is ready to exit the Global OUT NAK mode, it must clear the SGONAK bit in OTG_DCTL. This also clears the GONAKEFF interrupt (OTG_GINTSTS).
   – CGONAK = 1 in OTG_DCTL
6. If the application has masked this interrupt earlier, it must be unmasked as follows:
   – GONAKEFFM = 1 in OTG_GINTMSK

- **Disabling an OUT endpoint**

The application must use this sequence to disable an OUT endpoint that it has enabled.

Application programming sequence:

1. Before disabling any OUT endpoint, the application must enable Global OUT NAK mode in the core.
   – SGONAK = 1 in OTG_DCTL
2. Wait for the GONAKEFF interrupt (OTG_GINTSTS)
3. Disable the required OUT endpoint by programming the following fields:
   – EPDIS = 1 in OTG_DOEPCTLx
   – SNAK = 1 in OTG_DOEPCTLx
4. Wait for the EPDISD interrupt (OTG_DOEPINTx), which indicates that the OUT endpoint is completely disabled. When the EPDISD interrupt is asserted, the core also clears the following bits:
   – EPDIS = 0 in OTG_DOEPCTLx
   – EPENA = 0 in OTG_DOEPCTLx
5. The application must clear the Global OUT NAK bit to start receiving data from other non-disabled OUT endpoints.
   – SGONAK = 0 in OTG_DCTL

- **Generic non-isochronous OUT data transfers**

This section describes a regular non-isochronous OUT data transfer (control, bulk, or interrupt).

Application requirements:

1. Before setting up an OUT transfer, the application must allocate a buffer in the memory to accommodate all data to be received as part of the OUT transfer.
2. For OUT transfers, the transfer size field in the endpoint's transfer size register must be a multiple of the maximum packet size of the endpoint, adjusted to the word boundary.
   – transfer size[EPNUM] = *n* × (MPSIZ[EPNUM] + 4 – (MPSIZ[EPNUM] mod 4))
   – packet count[EPNUM] = *n*
   – *n* > 0
3. On any OUT endpoint interrupt, the application must read the endpoint's transfer size register to calculate the size of the payload in the memory. The received payload size can be less than the programmed transfer size.
   – Payload size in memory = application programmed initial transfer size – core updated final transfer size
   – Number of USB packets in which this payload was received = application programmed initial packet count – core updated final packet count

Internal data flow:

1. The application must set the transfer size and packet count fields in the endpoint-specific registers, clear the NAK bit, and enable the endpoint to receive the data.
2. Once the NAK bit is cleared, the core starts receiving data and writes it to the receive FIFO, as long as there is space in the receive FIFO. For every data packet received on the USB, the data packet and its status are written to the receive FIFO. Every packet (maximum packet size or short packet) written to the receive FIFO decrements the packet count field for that endpoint by 1.
   – OUT data packets received with bad data CRC are flushed from the receive FIFO automatically.
   – After sending an ACK for the packet on the USB, the core discards non-isochronous OUT data packets that the host, which cannot detect the ACK, re-sends. The application does not detect multiple back-to-back data OUT packets on the same endpoint with the same data PID. In this case the packet count is not decremented.
   – If there is no space in the receive FIFO, isochronous or non-isochronous data packets are ignored and not written to the receive FIFO. Additionally, non-isochronous OUT tokens receive a NAK handshake reply.
   – In all the above three cases, the packet count is not decremented because no data are written to the receive FIFO.
3. When the packet count becomes 0 or when a short packet is received on the endpoint, the NAK bit for that endpoint is set. Once the NAK bit is set, the isochronous or non-isochronous data packets are ignored and not written to the receive FIFO, and non-isochronous OUT tokens receive a NAK handshake reply.
4. After the data are written to the receive FIFO, the application reads the data from the receive FIFO and writes it to external memory, one packet at a time per endpoint.
5. At the end of every packet write on the AHB to external memory, the transfer size for the endpoint is decremented by the size of the written packet.
6. The OUT data transfer completed pattern for an OUT endpoint is written to the receive FIFO on one of the following conditions:
   – The transfer size is 0 and the packet count is 0
   – The last OUT data packet written to the receive FIFO is a short packet (0 ≤ packet size < maximum packet size)

7. When either the application pops this entry (OUT data transfer completed), a transfer completed interrupt is generated for the endpoint and the endpoint enable is cleared.

Application programming sequence:

1. Program the OTG_DOEPTSIZx register for the transfer size and the corresponding packet count.
2. Program the OTG_DOEPCTLx register with the endpoint characteristics, and set the EPENA and CNAK bits.
   – EPENA = 1 in OTG_DOEPCTLx
   – CNAK = 1 in OTG_DOEPCTLx
3. Wait for the RXFLVL interrupt (in OTG_GINTSTS) and empty the data packets from the receive FIFO.
   – This step can be repeated many times, depending on the transfer size.
4. Asserting the XFRC interrupt (OTG_DOEPINTx) marks a successful completion of the non-isochronous OUT data transfer.
5. Read the OTG_DOEPTSIZx register to determine the size of the received data payload.

- **Generic isochronous OUT data transfer**

This section describes a regular isochronous OUT data transfer.

Application requirements:

1. All the application requirements for non-isochronous OUT data transfers also apply to isochronous OUT data transfers.
2. For isochronous OUT data transfers, the transfer size and packet count fields must always be set to the number of maximum-packet-size packets that can be received in a single frame and no more. Isochronous OUT data transfers cannot span more than 1 frame.
3. The application must read all isochronous OUT data packets from the receive FIFO (data and status) before the end of the periodic frame (EOPF interrupt in OTG_GINTSTS).
4. To receive data in the following frame, an isochronous OUT endpoint must be enabled after the EOPF (OTG_GINTSTS) and before the SOF (OTG_GINTSTS).

Internal data flow:

1. The internal data flow for isochronous OUT endpoints is the same as that for non-isochronous OUT endpoints, but for a few differences.
2. When an isochronous OUT endpoint is enabled by setting the endpoint enable and clearing the NAK bits, the Even/Odd frame bit must also be set appropriately. The core receives data on an isochronous OUT endpoint in a particular frame only if the following condition is met:
   – EONUM (in OTG_DOEPCTLx) = FNSOF[0] (in OTG_DSTS)
3. When the application completely reads an isochronous OUT data packet (data and status) from the receive FIFO, the core updates the RXDPID field in OTG_DOEPTSIZx with the data PID of the last isochronous OUT data packet read from the receive FIFO.

Application programming sequence:

1. Program the OTG_DOEPTSIZx register for the transfer size and the corresponding packet count
2. Program the OTG_DOEPCTLx register with the endpoint characteristics and set the endpoint enable, ClearNAK, and Even/Odd frame bits.
   – EPENA = 1
   – CNAK = 1
   – EONUM = (0: Even/1: Odd)
3. Wait for the RXFLVL interrupt (in OTG_GINTSTS) and empty the data packets from the receive FIFO
   – This step can be repeated many times, depending on the transfer size.
4. The assertion of the XFRC interrupt (in OTG_DOEPINTx) marks the completion of the isochronous OUT data transfer. This interrupt does not necessarily mean that the data in memory are good.
5. This interrupt cannot always be detected for isochronous OUT transfers. Instead, the application can detect the INCOMPISOOUT interrupt in OTG_GINTSTS.
6. Read the OTG_DOEPTSIZx register to determine the size of the received transfer and to determine the validity of the data received in the frame. The application must treat the data received in memory as valid only if one of the following conditions is met:
   – RXDPID = DATA0 (in OTG_DOEPTSIZx) and the number of USB packets in which this payload was received = 1
   – RXDPID = DATA1 (in OTG_DOEPTSIZx) and the number of USB packets in which this payload was received = 2

     RXDPID = D2 (in OTG_DOEPTSIZx) and the number of USB packets in which this payload was received = 3The number of USB packets in which this payload was received =
     Application programmed initial packet count – core updated final packet count

   The application can discard invalid data packets.

- **Incomplete isochronous OUT data transfers**

This section describes the application programming sequence when isochronous OUT data packets are dropped inside the core.

Internal data flow:

1. For isochronous OUT endpoints, the XFRC interrupt (in OTG_DOEPINTx) may not always be asserted. If the core drops isochronous OUT data packets, the application could fail to detect the XFRC interrupt (OTG_DOEPINTx) under the following circumstances:
   – When the receive FIFO cannot accommodate the complete ISO OUT data packet, the core drops the received ISO OUT data
   – When the isochronous OUT data packet is received with CRC errors
   – When the isochronous OUT token received by the core is corrupted
   – When the application is very slow in reading the data from the receive FIFO
2. When the core detects an end of periodic frame before transfer completion to all isochronous OUT endpoints, it asserts the incomplete isochronous OUT data interrupt (INCOMPISOOUT in OTG_GINTSTS), indicating that an XFRC interrupt (in OTG_DOEPINTx) is not asserted on at least one of the isochronous OUT endpoints. At

this point, the endpoint with the incomplete transfer remains enabled, but no active transfers remain in progress on this endpoint on the USB.

Application programming sequence:

1. Asserting the INCOMPISOOUT interrupt (OTG_GINTSTS) indicates that in the current frame, at least one isochronous OUT endpoint has an incomplete transfer.
2. If this occurs because isochronous OUT data is not completely emptied from the endpoint, the application must ensure that the application empties all isochronous OUT data (data and status) from the receive FIFO before proceeding.
   – When all data are emptied from the receive FIFO, the application can detect the XFRC interrupt (OTG_DOEPINTx). In this case, the application must re-enable the endpoint to receive isochronous OUT data in the next frame.
3. When it receives an INCOMPISOOUT interrupt (in OTG_GINTSTS), the application must read the control registers of all isochronous OUT endpoints (OTG_DOEPCTLx) to determine which endpoints had an incomplete transfer in the current microframe. An endpoint transfer is incomplete if both the following conditions are met:
   – EONUM bit (in OTG_DOEPCTLx) = FNSOF[0] (in OTG_DSTS)
   – EPENA = 1 (in OTG_DOEPCTLx)
4. The previous step must be performed before the SOF interrupt (in OTG_GINTSTS) is detected, to ensure that the current frame number is not changed.
5. For isochronous OUT endpoints with incomplete transfers, the application must discard the data in the memory and disable the endpoint by setting the EPDIS bit in OTG_DOEPCTLx.
6. Wait for the EPDISD interrupt (in OTG_DOEPINTx) and enable the endpoint to receive new data in the next frame.
   – Because the core can take some time to disable the endpoint, the application may not be able to receive the data in the next frame after receiving bad isochronous data.

- **Stalling a non-isochronous OUT endpoint**

This section describes how the application can stall a non-isochronous endpoint.

1. Put the core in the Global OUT NAK mode.
2. Disable the required endpoint
   – When disabling the endpoint, instead of setting the SNAK bit in OTG_DOEPCTL, set STALL = 1 (in OTG_DOEPCTL).

   The STALL bit always takes precedence over the NAK bit.
3. When the application is ready to end the STALL handshake for the endpoint, the STALL bit (in OTG_DOEPCTLx) must be cleared.
4. If the application is setting or clearing a STALL for an endpoint due to a SetFeature.Endpoint Halt or ClearFeature.Endpoint Halt command, the STALL bit must be set or cleared before the application sets up the status stage transfer on the control endpoint.

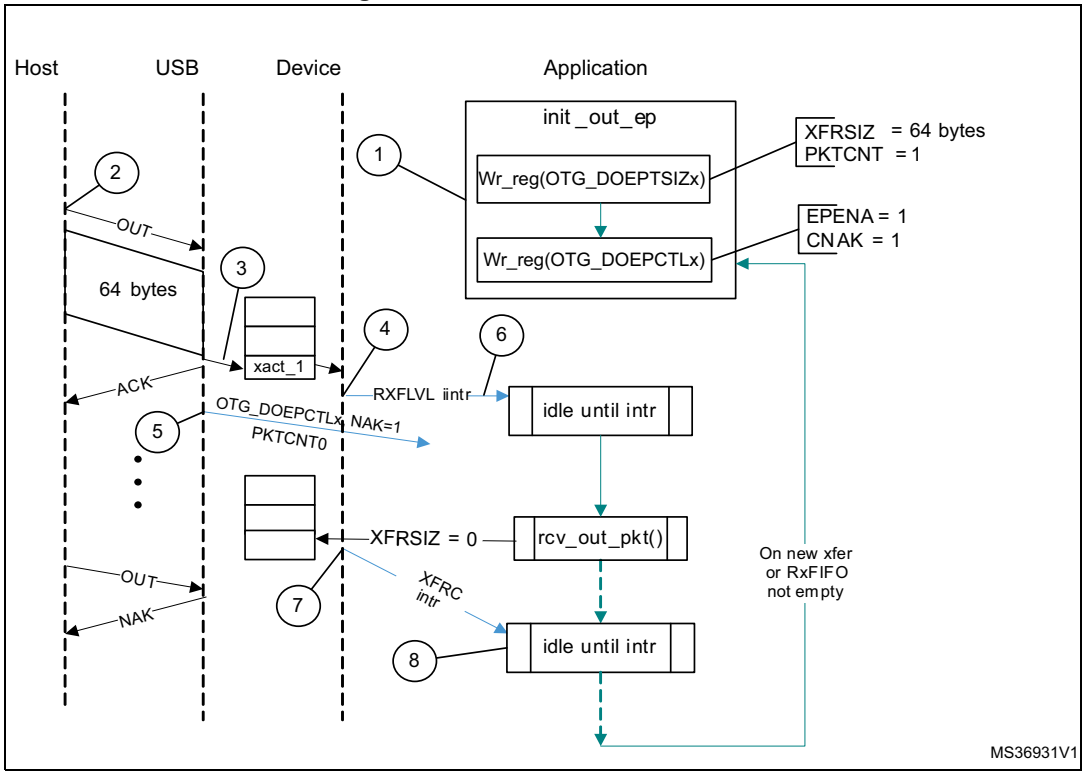
### Examples

This section describes and depicts some fundamental transfer types and scenarios.

- Bulk OUT transaction

*Figure 762* depicts the reception of a single Bulk OUT data packet from the USB to the AHB and describes the events involved in the process.

**Figure 762. Bulk OUT transaction**



After a SetConfiguration/SetInterface command, the application initializes all OUT endpoints by setting CNAK = 1 and EPENA = 1 (in OTG_DOEPCTLx), and setting a suitable XFRSIZ and PKTCNT in the OTG_DOEPTSIZx register.

1. host attempts to send data (OUT token) to an endpoint.
2. When the core receives the OUT token on the USB, it stores the packet in the Rx FIFO because space is available there.
3. After writing the complete packet in the Rx FIFO, the core then asserts the RXFLVL interrupt (in OTG_GINTSTS).
4. On receiving the PKTCNT number of USB packets, the core internally sets the NAK bit for this endpoint to prevent it from receiving any more packets.
5. The application processes the interrupt and reads the data from the Rx FIFO.
6. When the application has read all the data (equivalent to XFRSIZ), the core generates an XFRC interrupt (in OTG_DOEPINTx).
7. The application processes the interrupt and uses the setting of the XFRC interrupt bit (in OTG_DOEPINTx) to determine that the intended transfer is complete.

## IN data transfers

- **Packet write**

This section describes how the application writes data packets to the endpoint FIFO when dedicated transmit FIFOs are enabled.

1. The application can either choose the polling or the interrupt mode.
   – In polling mode, the application monitors the status of the endpoint transmit data FIFO by reading the OTG_DTXFSTSx register, to determine if there is enough space in the data FIFO.
   – In interrupt mode, the application waits for the TXFE interrupt (in OTG_DIEPINTx) and then reads the OTG_DTXFSTSx register, to determine if there is enough space in the data FIFO.
   – To write a single non-zero length data packet, there must be space to write the entire packet in the data FIFO.
   – To write zero length packet, the application must not look at the FIFO space.
2. Using one of the above mentioned methods, when the application determines that there is enough space to write a transmit packet, the application must first write into the endpoint control register, before writing the data into the data FIFO. Typically, the application, must do a read modify write on the OTG_DIEPCTLx register to avoid modifying the contents of the register, except for setting the endpoint enable bit.

The application can write multiple packets for the same endpoint into the transmit FIFO, if space is available. For periodic IN endpoints, the application must write packets only for one microframe. It can write packets for the next periodic transaction only after getting transfer complete for the previous transaction.

- **Setting IN endpoint NAK**

Internal data flow:

1. When the application sets the IN NAK for a particular endpoint, the core stops transmitting data on the endpoint, irrespective of data availability in the endpoint's transmit FIFO.
2. Non-isochronous IN tokens receive a NAK handshake reply
   – Isochronous IN tokens receive a zero-data-length packet reply
3. The core asserts the INEPNE (IN endpoint NAK effective) interrupt in OTG_DIEPINTx in response to the SNAK bit in OTG_DIEPCTLx.
4. Once this interrupt is seen by the application, the application can assume that the endpoint is in IN NAK mode. This interrupt can be cleared by the application by setting the CNAK bit in OTG_DIEPCTLx.

Application programming sequence:

1. To stop transmitting any data on a particular IN endpoint, the application must set the IN NAK bit. To set this bit, the following field must be programmed.
   – SNAK = 1 in OTG_DIEPCTLx
2. Wait for assertion of the INEPNE interrupt in OTG_DIEPINTx. This interrupt indicates that the core has stopped transmitting data on the endpoint.
3. The core can transmit valid IN data on the endpoint after the application has set the NAK bit, but before the assertion of the NAK Effective interrupt.
4. The application can mask this interrupt temporarily by writing to the INEPNEM bit in OTG_DIEPMSK.
   – INEPNEM = 0 in OTG_DIEPMSK
5. To exit endpoint NAK mode, the application must clear the NAK status bit (NAKSTS) in OTG_DIEPCTLx. This also clears the INEPNE interrupt (in OTG_DIEPINTx).

– CNAK = 1 in OTG_DIEPCTLx

6. If the application masked this interrupt earlier, it must be unmasked as follows:
   – INEPNEM = 1 in OTG_DIEPMSK

- **IN endpoint disable**

Use the following sequence to disable a specific IN endpoint that has been previously enabled.

Application programming sequence:

1. The application must stop writing data on the AHB for the IN endpoint to be disabled.
2. The application must set the endpoint in NAK mode.
   – SNAK = 1 in OTG_DIEPCTLx
3. Wait for the INEPNE interrupt in OTG_DIEPINTx.
4. Set the following bits in the OTG_DIEPCTLx register for the endpoint that must be disabled.
   – EPDIS = 1 in OTG_DIEPCTLx
   – SNAK = 1 in OTG_DIEPCTLx
5. Assertion of the EPDISD interrupt in OTG_DIEPINTx indicates that the core has completely disabled the specified endpoint. Along with the assertion of the interrupt, the core also clears the following bits:
   – EPENA = 0 in OTG_DIEPCTLx
   – EPDIS = 0 in OTG_DIEPCTLx
6. The application must read the OTG_DIEPTSIZx register for the periodic IN EP, to calculate how much data on the endpoint were transmitted on the USB.
7. The application must flush the data in the endpoint transmit FIFO, by setting the following fields in the OTG_GRSTCTL register:
   – TXFNUM (in OTG_GRSTCTL) = Endpoint transmit FIFO number
   – TXFFLSH in (OTG_GRSTCTL) = 1

The application must poll the OTG_GRSTCTL register, until the TXFFLSH bit is cleared by the core, which indicates the end of flush operation. To transmit new data on this endpoint, the application can re-enable the endpoint at a later point.

- **Generic non-periodic IN data transfers**

Application requirements:

1. Before setting up an IN transfer, the application must ensure that all data to be transmitted as part of the IN transfer are part of a single buffer.
2. For IN transfers, the transfer size field in the endpoint transfer size register denotes a payload that constitutes multiple maximum-packet-size packets and a single short packet. This short packet is transmitted at the end of the transfer.
   – To transmit a few maximum-packet-size packets and a short packet at the end of the transfer:

     Transfer size[EPNUM] = $x$ × MPSIZ[EPNUM] + sp

     If (sp > 0), then packet count[EPNUM] = x + 1.
     Otherwise, packet count[EPNUM] = $x$
   – To transmit a single zero-length data packet:

Transfer size[EPNUM] = 0

Packet count[EPNUM] = 1

– To transmit a few maximum-packet-size packets and a zero-length data packet at the end of the transfer, the application must split the transfer into two parts. The first sends maximum-packet-size data packets and the second sends the zero-length data packet alone.

  First transfer: transfer size[EPNUM] = *x* × MPSIZ[epnum]; packet count = *n*;

  Second transfer: transfer size[EPNUM] = 0; packet count = 1;

3. Once an endpoint is enabled for data transfers, the core updates the transfer size register. At the end of the IN transfer, the application must read the transfer size register to determine how much data posted in the transmit FIFO have already been sent on the USB.
4. Data fetched into transmit FIFO = Application-programmed initial transfer size – core-updated final transfer size
   – Data transmitted on USB = (application-programmed initial packet count – core updated final packet count) × MPSIZ[EPNUM]
   – Data yet to be transmitted on USB = (Application-programmed initial transfer size – data transmitted on USB)

Internal data flow:

1. The application must set the transfer size and packet count fields in the endpoint-specific registers and enable the endpoint to transmit the data.
2. The application must also write the required data to the transmit FIFO for the endpoint.
3. Every time a packet is written into the transmit FIFO by the application, the transfer size for that endpoint is decremented by the packet size. The data is fetched from the memory by the application, until the transfer size for the endpoint becomes 0. After writing the data into the FIFO, the “number of packets in FIFO” count is incremented (this is a 3-bit count, internally maintained by the core for each IN endpoint transmit FIFO. The maximum number of packets maintained by the core at any time in an IN endpoint FIFO is eight). For zero-length packets, a separate flag is set for each FIFO, without any data in the FIFO.
4. Once the data are written to the transmit FIFO, the core reads them out upon receiving an IN token. For every non-isochronous IN data packet transmitted with an ACK handshake, the packet count for the endpoint is decremented by one, until the packet count is zero. The packet count is not decremented on a timeout.
5. For zero length packets (indicated by an internal zero length flag), the core sends out a zero-length packet for the IN token and decrements the packet count field.
6. If there are no data in the FIFO for a received IN token and the packet count field for that endpoint is zero, the core generates an “IN token received when Tx FIFO is empty” (ITTXFE) interrupt for the endpoint, provided that the endpoint NAK bit is not set. The core responds with a NAK handshake for non-isochronous endpoints on the USB.
7. The core internally rewinds the FIFO pointers and no timeout interrupt is generated.
8. When the transfer size is 0 and the packet count is 0, the transfer complete (XFRC) interrupt for the endpoint is generated and the endpoint enable is cleared.

Application programming sequence:

1. Program the OTG_DIEPTSIZx register with the transfer size and corresponding packet count.
2. Program the OTG_DIEPCTLx register with the endpoint characteristics and set the CNAK and EPENA (endpoint enable) bits.
3. When transmitting non-zero length data packet, the application must poll the OTG_DTXFSTSx register (where x is the FIFO number associated with that endpoint) to determine whether there is enough space in the data FIFO. The application can optionally use TXFE (in OTG_DIEPINTx) before writing the data.

- **Generic periodic IN data transfers**

This section describes a typical periodic IN data transfer.

Application requirements:

1. Application requirements 1, 2, 3, and 4 of *Generic non-periodic IN data transfers on page 3281* also apply to periodic IN data transfers, except for a slight modification of requirement 2.
   - The application can only transmit multiples of maximum-packet-size data packets or multiples of maximum-packet-size packets, plus a short packet at the end. To transmit a few maximum-packet-size packets and a short packet at the end of the transfer, the following conditions must be met:

     transfer size[EPNUM] = x × MPSIZ[EPNUM] + sp
     (where *x* is an integer ≥ 0, and 0 ≤ sp < MPSIZ[EPNUM])

     If (sp > 0), packet count[EPNUM] = *x* + 1
     Otherwise, packet count[EPNUM] = *x*;

     MCNT[EPNUM] = packet count[EPNUM]
   - The application cannot transmit a zero-length data packet at the end of a transfer. It can transmit a single zero-length data packet by itself. To transmit a single zero-length data packet:
   - transfer size[EPNUM] = 0

     packet count[EPNUM] = 1

     MCNT[EPNUM] = packet count[EPNUM]
2. The application can only schedule data transfers one frame at a time.
   - (MCNT – 1) × MPSIZ ≤ XFERSIZ ≤ MCNT × MPSIZ
   - PKTCNT = MCNT (in OTG_DIEPTSIZx)
   - If XFERSIZ < MCNT × MPSIZ, the last data packet of the transfer is a short packet.
   - Note that: MCNT is in OTG_DIEPTSIZx, MPSIZ is in OTG_DIEPCTLx, PKTCNT is in OTG_DIEPTSIZx and XFERSIZ is in OTG_DIEPTSIZx
3. The complete data to be transmitted in the frame must be written into the transmit FIFO by the application, before the IN token is received. Even when 1 word of the data to be transmitted per frame is missing in the transmit FIFO when the IN token is received, the core behaves as when the FIFO is empty. When the transmit FIFO is empty:
   - A zero data length packet would be transmitted on the USB for isochronous IN endpoints
   - A NAK handshake would be transmitted on the USB for interrupt IN endpoints

Internal data flow:

1. The application must set the transfer size and packet count fields in the endpoint-specific registers and enable the endpoint to transmit the data.
2. The application must also write the required data to the associated transmit FIFO for the endpoint.
3. Every time the application writes a packet to the transmit FIFO, the transfer size for that endpoint is decremented by the packet size. The data are fetched from application memory until the transfer size for the endpoint becomes 0.
4. When an IN token is received for a periodic endpoint, the core transmits the data in the FIFO, if available. If the complete data payload (complete packet, in dedicated FIFO mode) for the frame is not present in the FIFO, then the core generates an IN token received when Tx FIFO empty interrupt for the endpoint.
   – A zero-length data packet is transmitted on the USB for isochronous IN endpoints
   – A NAK handshake is transmitted on the USB for interrupt IN endpoints
5. The packet count for the endpoint is decremented by 1 under the following conditions:
   – For isochronous endpoints, when a zero- or non-zero-length data packet is transmitted
   – For interrupt endpoints, when an ACK handshake is transmitted
   – When the transfer size and packet count are both 0, the transfer completed interrupt for the endpoint is generated and the endpoint enable is cleared.
6. At the “Periodic frame Interval” (controlled by PFIVL in OTG_DCFG), when the core finds non-empty any of the isochronous IN endpoint FIFOs scheduled for the current frame non-empty, the core generates an IISOIXFR interrupt in OTG_GINTSTS.

Application programming sequence:

1. Program the OTG_DIEPCTLx register with the endpoint characteristics and set the CNAK and EPENA bits.
2. Write the data to be transmitted in the next frame to the transmit FIFO.
3. Asserting the ITTXFE interrupt (in OTG_DIEPINTx) indicates that the application has not yet written all data to be transmitted to the transmit FIFO.
4. If the interrupt endpoint is already enabled when this interrupt is detected, ignore the interrupt. If it is not enabled, enable the endpoint so that the data can be transmitted on the next IN token attempt.
5. Asserting the XFRC interrupt (in OTG_DIEPINTx) with no ITTXFE interrupt in OTG_DIEPINTx indicates the successful completion of an isochronous IN transfer. A read to the OTG_DIEPTSIZx register must give transfer size = 0 and packet count = 0, indicating all data were transmitted on the USB.
6. Asserting the XFRC interrupt (in OTG_DIEPINTx), with or without the ITTXFE interrupt (in OTG_DIEPINTx), indicates the successful completion of an interrupt IN transfer. A read to the OTG_DIEPTSIZx register must give transfer size = 0 and packet count = 0, indicating all data were transmitted on the USB.
7. Asserting the incomplete isochronous IN transfer (IISOIXFR) interrupt in OTG_GINTSTS with none of the aforementioned interrupts indicates the core did not receive at least 1 periodic IN token in the current frame.

- **Incomplete isochronous IN data transfers**

This section describes what the application must do on an incomplete isochronous IN data transfer.

Internal data flow:

1. An isochronous IN transfer is treated as incomplete in one of the following conditions:
   a) The core receives a corrupted isochronous IN token on at least one isochronous IN endpoint. In this case, the application detects an incomplete isochronous IN transfer interrupt (IISOIXFR in OTG_GINTSTS).
   b) The application is slow to write the complete data payload to the transmit FIFO and an IN token is received before the complete data payload is written to the FIFO. In this case, the application detects an IN token received when Tx FIFO empty interrupt in OTG_DIEPINTx. The application can ignore this interrupt, as it eventually results in an incomplete isochronous IN transfer interrupt (IISOIXFR in OTG_GINTSTS) at the end of periodic frame.

      The core transmits a zero-length data packet on the USB in response to the received IN token.
2. The application must stop writing the data payload to the transmit FIFO as soon as possible.
3. The application must set the NAK bit and the disable bit for the endpoint.
4. The core disables the endpoint, clears the disable bit, and asserts the endpoint disable interrupt for the endpoint.

Application programming sequence:

1. The application can ignore the IN token received when Tx FIFO empty interrupt in OTG_DIEPINTx on any isochronous IN endpoint, as it eventually results in an incomplete isochronous IN transfer interrupt (in OTG_GINTSTS).
2. Assertion of the incomplete isochronous IN transfer interrupt (in OTG_GINTSTS) indicates an incomplete isochronous IN transfer on at least one of the isochronous IN endpoints.
3. The application must read the endpoint control register for all isochronous IN endpoints to detect endpoints with incomplete IN data transfers.
4. The application must stop writing data to the Periodic Transmit FIFOs associated with these endpoints on the AHB.
5. Program the following fields in the OTG_DIEPCTLx register to disable the endpoint:
   – SNAK = 1 in OTG_DIEPCTLx
   – EPDIS = 1 in OTG_DIEPCTLx
6. The assertion of the endpoint disabled interrupt in OTG_DIEPINTx indicates that the core has disabled the endpoint.
   – At this point, the application must flush the data in the associated transmit FIFO or overwrite the existing data in the FIFO by enabling the endpoint for a new transfer in the next microframe. To flush the data, the application must use the OTG_GRSTCTL register.

- **Stalling non-isochronous IN endpoints**

This section describes how the application can stall a non-isochronous endpoint.

Application programming sequence:

1. Disable the IN endpoint to be stalled. Set the STALL bit as well.
2. EPDIS = 1 in OTG_DIEPCTLx, when the endpoint is already enabled
   – STALL = 1 in OTG_DIEPCTLx
   – The STALL bit always takes precedence over the NAK bit
3. Assertion of the endpoint disabled interrupt (in OTG_DIEPINTx) indicates to the application that the core has disabled the specified endpoint.
4. The application must flush the non-periodic or periodic transmit FIFO, depending on the endpoint type. In case of a non-periodic endpoint, the application must re-enable the other non-periodic endpoints that do not need to be stalled, to transmit data.
5. Whenever the application is ready to end the STALL handshake for the endpoint, the STALL bit must be cleared in OTG_DIEPCTLx.
6. If the application sets or clears a STALL bit for an endpoint due to a SetFeature.Endpoint Halt command or ClearFeature.Endpoint Halt command, the STALL bit must be set or cleared before the application sets up the status stage transfer on the control endpoint.

Special case: stalling the control OUT endpoint

The core must stall IN/OUT tokens if, during the data stage of a control transfer, the host sends more IN/OUT tokens than are specified in the SETUP packet. In this case, the application must enable the ITTXFE interrupt in OTG_DIEPINTx and the OTEPDIS interrupt in OTG_DOEPINTx during the data stage of the control transfer, after the core has transferred the amount of data specified in the SETUP packet. Then, when the application receives this interrupt, it must set the STALL bit in the corresponding endpoint control register, and clear this interrupt.

### 60.15.7 Worst case response time

When the OTG controller acts as a device, there is a worst case response time for any tokens that follow an isochronous OUT. This worst case response time depends on the AHB clock frequency.

The core registers are in the AHB domain, and the core does not accept another token before updating these register values. The worst case is for any token following an isochronous OUT, because for an isochronous transaction, there is no handshake and the next token could come sooner. This worst case value is 7 PHY clocks when the AHB clock is the same as the PHY clock. When the AHB clock is faster, this value is smaller.

If this worst case condition occurs, the core responds to bulk/interrupt tokens with a NAK and drops isochronous and SETUP tokens. The host interprets this as a timeout condition for SETUP and retries the SETUP packet. For isochronous transfers, the Incomplete isochronous IN transfer interrupt (IISOIXFR) and Incomplete isochronous OUT transfer interrupt (IISOOXFR) inform the application that isochronous IN/OUT packets were dropped.

#### Choosing the value of TRDT in OTG_GUSBCFG

The value in TRDT (OTG_GUSBCFG) is the time it takes for the MAC, in terms of PHY clocks after it has received an IN token, to get the FIFO status, and thus the first data from the PFC block. This time involves the synchronization delay between the PHY and AHB clocks. The worst case delay for this is when the AHB clock is the same as the PHY clock. In this case, the delay is 5 clocks.

Once the MAC receives an IN token, this information (token received) is synchronized to the AHB clock by the PFC (the PFC runs on the AHB clock). The PFC then reads the data from the SPRAM and writes them into the dual clock source buffer. The MAC then reads the data out of the source buffer (4 deep).

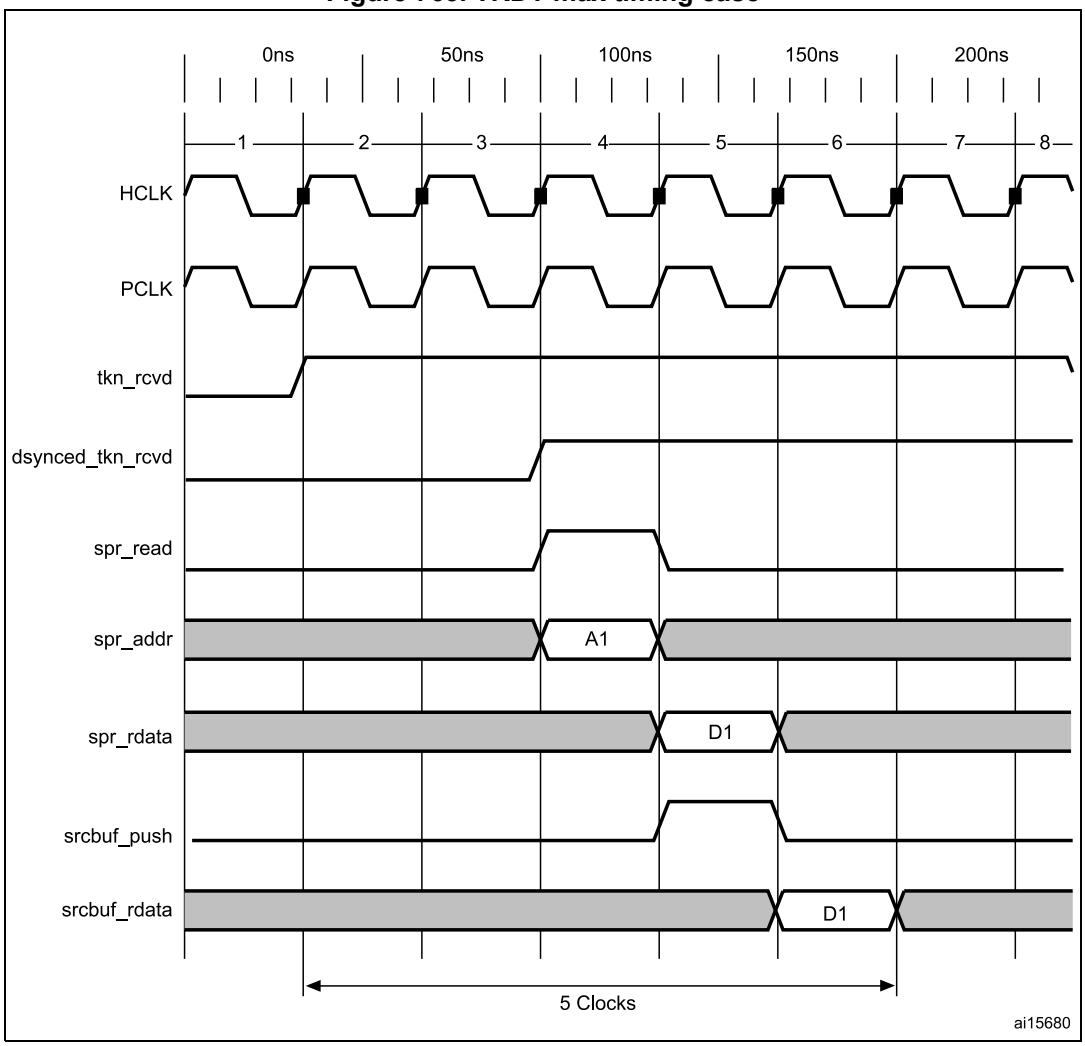
If the AHB is running at a higher frequency than the PHY, the application can use a smaller value for TRDT (in OTG_GUSBCFG).

*Figure 763* has the following signals:

- tkn_rcvd: Token received information from MAC to PFC
- dynced_tkn_rcvd: Doubled sync tkn_rcvd, from PCLK to HCLK domain
- spr_read: Read to SPRAM
- spr_addr: Address to SPRAM
- spr_rdata: Read data from SPRAM
- srcbuf_push: Push to the source buffer
- srcbuf_rdata: Read data from the source buffer. Data seen by MAC

To calculate the value of TRDT, refer to *Table 466: TRDT values (HS)*.

**Figure 763. TRDT max timing case**



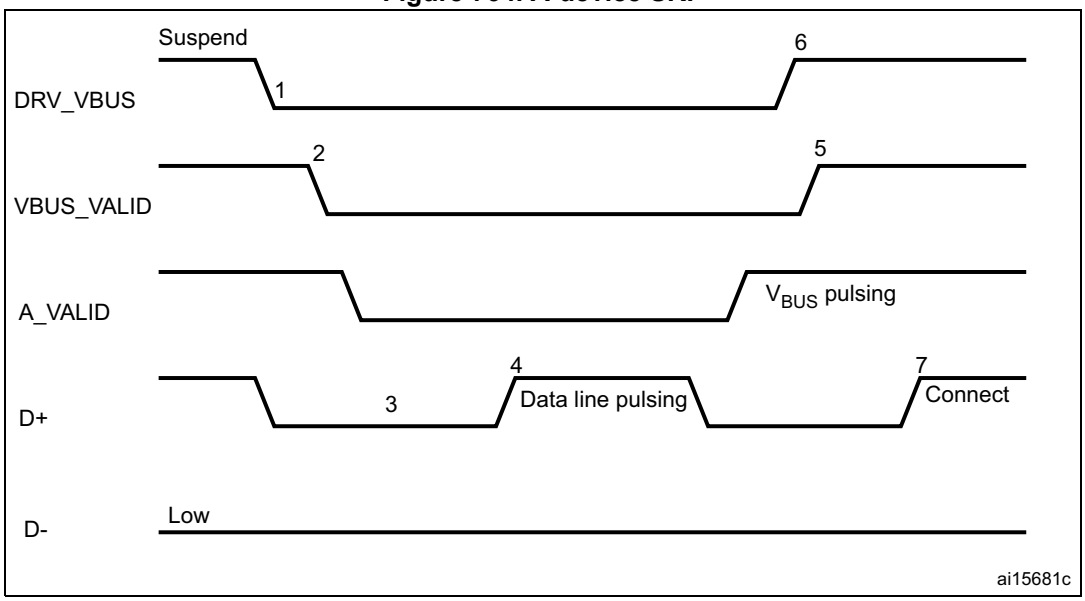
## 60.15.8 OTG programming model

The OTG controller is an OTG device supporting HNP and SRP. When the core is connected to an “A” plug, it is referred to as an A-device. When the core is connected to a “B” plug it is referred to as a B-device. In host mode, the OTG controller turns off $V_{BUS}$ to conserve power. SRP is a method by which the B-device signals the A-device to turn on $V_{BUS}$ power. A device must perform both data-line pulsing and $V_{BUS}$ pulsing, but a host can detect either data-line pulsing or $V_{BUS}$ pulsing for SRP. HNP is a method by which the B-device negotiates and switches to host role. In Negotiated mode after HNP, the B-device suspends the bus and reverts to the device role.

### A-device session request protocol

The application must set the SRP-capable bit in the core USB configuration register. This enables the OTG controller to detect SRP as an A-device.

**Figure 764. A-device SRP**



1. DRV_VBUS = $V_{BUS}$ drive signal to the PHY
   VBUS_VALID = $V_{BUS}$ valid signal from PHY
   A_VALID = A-peripheral $V_{BUS}$ level signal to PHY
   D+ = Data plus line
   D- = Data minus line

The following points refer and describe the signal numeration shown in the *Figure 764*:

1. To save power, the application suspends and turns off port power when the bus is idle by writing the port suspend and port power bits in the host port control and status register.
2. PHY indicates port power off by deasserting the VBUS_VALID signal.
3. The device must detect SE0 for at least 2 ms to start SRP when $V_{BUS}$ power is off.
4. To initiate SRP, the device turns on its data line pull-up resistor for 5 to 10 ms. The OTG controller detects data-line pulsing.
5. The device drives $V_{BUS}$ above the A-device session valid (2.0 V minimum) for $V_{BUS}$ pulsing.

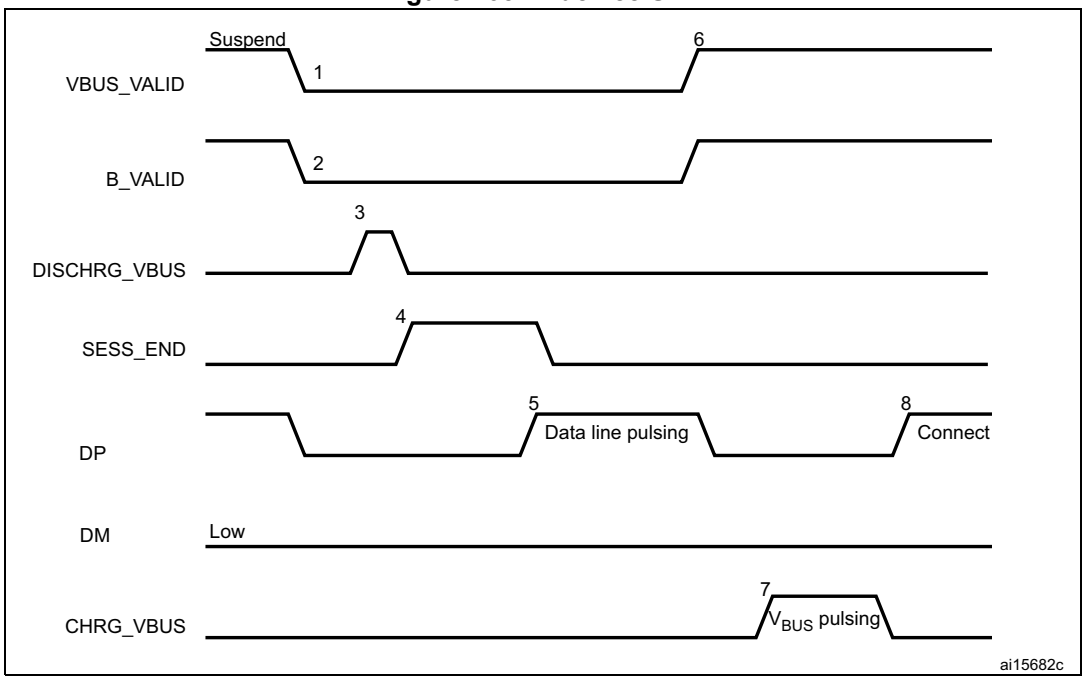
The OTG controller interrupts the application on detecting SRP. The session request detected bit is set in Global interrupt status register (SRQINT set in OTG_GINTSTS).

6. The application must service the session request detected interrupt and turn on the port power bit by writing the port power bit in the host port control and status register. The PHY indicates port power-on by asserting the VBUS_VALID signal.
7. When the USB is powered, the device connects, completing the SRP process.

### B-device session request protocol

The application must set the SRP-capable bit in the core USB configuration register. This enables the OTG controller to initiate SRP as a B-device. SRP is a means by which the OTG controller can request a new session from the host.

**Figure 765. B-device SRP**



1. VBUS_VALID = $V_{BUS}$ valid signal from PHY
B_VALID = B-peripheral valid session to PHY
DISCHRG_VBUS = discharge signal to PHY
SESS_END = session end signal to PHY
CHRG_VBUS = charge $V_{BUS}$ signal to PHY
DP = Data plus line
DM = Data minus line

The following points refer and describe the signal numeration shown in the *Figure 765*:

1. To save power, the host suspends and turns off port power when the bus is idle.
The OTG controller sets the early suspend bit in the core interrupt register after 3 ms of bus idleness. Following this, the OTG controller sets the USB suspend bit in the core interrupt register.
The OTG controller informs the PHY to discharge $V_{BUS}$.
2. The PHY indicates the session's end to the device. This is the initial condition for SRP.
The OTG controller requires 2 ms of SE0 before initiating SRP.
For a USB 1.1 full-speed serial transceiver, the application must wait until $V_{BUS}$ discharges to 0.2 V after BSVLD (in OTG_GOTGCTL) is deasserted. This discharge

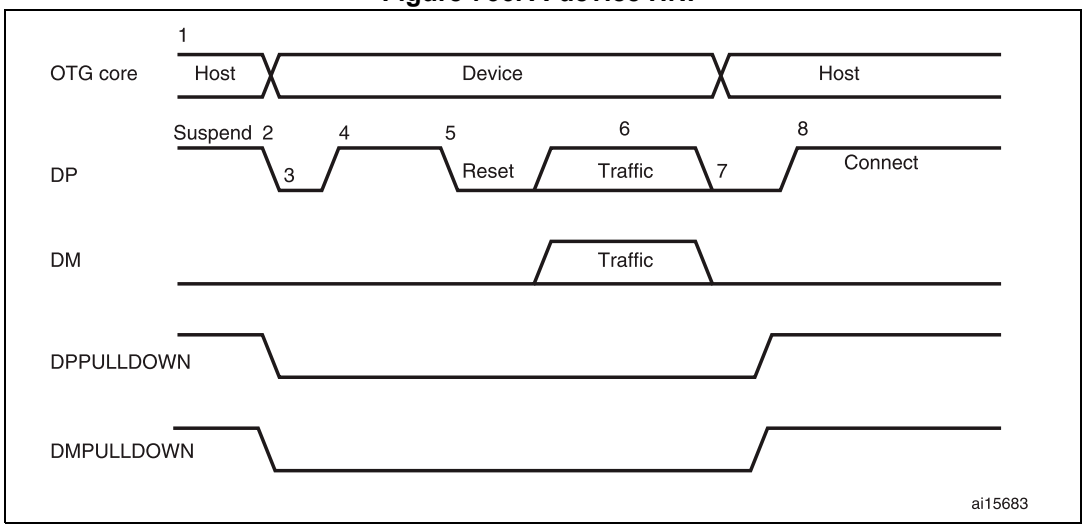
time can be obtained from the transceiver vendor and varies from one transceiver to another.

3. The OTG core informs the PHY to speed up $V_{BUS}$ discharge.
4. The application initiates SRP by writing the session request bit in the OTG control and status register. The OTG controller perform data-line pulsing followed by $V_{BUS}$ pulsing.
5. The host detects SRP from either the data-line or $V_{BUS}$ pulsing, and turns on $V_{BUS}$. The PHY indicates $V_{BUS}$ power-on to the device.
6. The OTG controller performs $V_{BUS}$ pulsing.
   The host starts a new session by turning on $V_{BUS}$, indicating SRP success. The OTG controller interrupts the application by setting the session request success status change bit in the OTG interrupt status register. The application reads the session request success bit in the OTG control and status register.
7. When the USB is powered, the OTG controller connects, completing the SRP process.

### A-device host negotiation protocol

HNP switches the USB host role from the A-device to the B-device. The application must set the HNP-capable bit in the core USB configuration register to enable the OTG controller to perform HNP as an A-device.

**Figure 766. A-device HNP**



1. DPPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DP line inside the PHY.
   DMPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DM line inside the PHY.

The following points refer and describe the signal numeration shown in the *Figure 766*:

1. The OTG controller sends the B-device a SetFeature b_hnp_enable descriptor to enable HNP support. The B-device's ACK response indicates that the B-device

supports HNP. The application must set host Set HNP enable bit in the OTG control and status register to indicate to the OTG controller that the B-device supports HNP.

2. When it has finished using the bus, the application suspends by writing the port suspend bit in the host port control and status register.
3. When the B-device observes a USB suspend, it disconnects, indicating the initial condition for HNP. The B-device initiates HNP only when it must switch to the host role; otherwise, the bus continues to be suspended.

   The OTG controller sets the host negotiation detected interrupt in the OTG interrupt status register, indicating the start of HNP.

   The OTG controller deasserts the DM pull down and DM pull down in the PHY to indicate a device role. The PHY enables the OTG_DP pull-up resistor to indicate a connect for B-device.

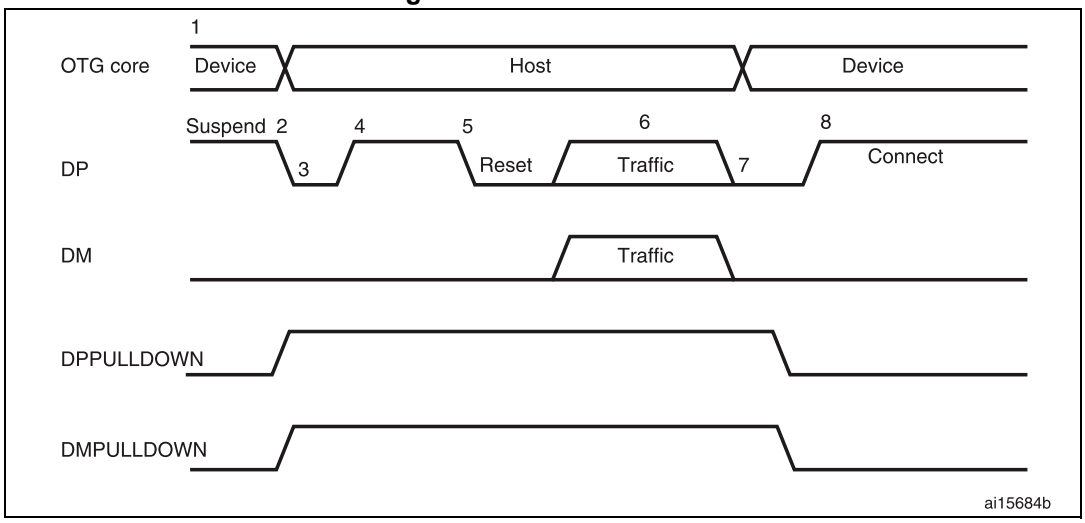
   The application must read the current mode bit in the OTG control and status register to determine device mode operation.
4. The B-device detects the connection, issues a USB reset, and enumerates the OTG controller for data traffic.
5. The B-device continues the host role, initiating traffic, and suspends the bus when done.

   The OTG controller sets the early suspend bit in the core interrupt register after 3 ms of bus idleness. Following this, the OTG controller sets the USB suspend bit in the core interrupt register.
6. In Negotiated mode, the OTG controller detects the suspend, disconnects, and switches back to the host role. The OTG controller asserts the DM pull down and DM pull down in the PHY to indicate its assumption of the host role.
7. The OTG controller sets the connector ID status change interrupt in the OTG interrupt status register. The application must read the connector ID status in the OTG control and status register to determine the OTG controller operation as an A-device. This indicates the completion of HNP to the application. The application must read the Current mode bit in the OTG control and status register to determine host mode operation.
8. The B-device connects, completing the HNP process.

### B-device host negotiation protocol

HNP switches the USB host role from B-device to A-device. The application must set the HNP-capable bit in the core USB configuration register to enable the OTG controller to perform HNP as a B-device.

**Figure 767. B-device HNP**



1. DPPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DP line inside the PHY. DMPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DM line inside the PHY.

The following points refer and describe the signal numeration shown in the *Figure 767*:

1. The A-device sends the SetFeature b_hnp_enable descriptor to enable HNP support. The OTG controller's ACK response indicates that it supports HNP. The application must set the device HNP enable bit in the OTG control and status register to indicate HNP support.

   The application sets the HNP request bit in the OTG control and status register to indicate to the OTG controller to initiate HNP.

2. When it has finished using the bus, the A-device suspends by writing the port suspend bit in the host port control and status register.

   The OTG controller sets the Early suspend bit in the core interrupt register after 3 ms of bus idleness. Following this, the OTG controller sets the USB suspend bit in the core interrupt register.

   The OTG controller disconnects and the A-device detects SE0 on the bus, indicating HNP. The OTG controller asserts the DP pull down and DM pull down in the PHY to indicate its assumption of the host role.

   The A-device responds by activating its OTG_DP pull-up resistor within 3 ms of detecting SE0. The OTG controller detects this as a connect.

   The OTG controller sets the host negotiation success status change interrupt in the OTG interrupt status register, indicating the HNP status. The application must read the host negotiation success bit in the OTG control and status register to determine host

negotiation success. The application must read the current Mode bit in the core interrupt register (OTG_GINTSTS) to determine host mode operation.

3. The application sets the reset bit (PRST in OTG_HPRT) and the OTG controller issues a USB reset and enumerates the A-device for data traffic.
4. The OTG controller continues the host role of initiating traffic, and when done, suspends the bus by writing the port suspend bit in the host port control and status register.
5. In Negotiated mode, when the A-device detects a suspend, it disconnects and switches back to the host role. The OTG controller deasserts the DP pull down and DM pull down in the PHY to indicate the assumption of the device role.
6. The application must read the current mode bit in the core interrupt (OTG_GINTSTS) register to determine the host mode operation.
7. The OTG controller connects, completing the HNP process.

# 61 USB HS PHY controller (USBPHYC)

## 61.1 USBPHYC introduction

The USBPHYC block is in the context of a system containing:

- Two port high-speed PHY
- USB high-speed OTG controller (single port)
- USB high-speed EHCI/OHCI host controller (two ports)

The USBPHYC enables the control and observation of a 2 port high-speed USB PHY configuration and status, and the sharing of one of those ports between different controllers.

## 61.2 USBPHYC main features

- Supports a two port high-speed PHY
- Enables one port to be switched between two possible controllers

## 61.3 USBPHYC functional description

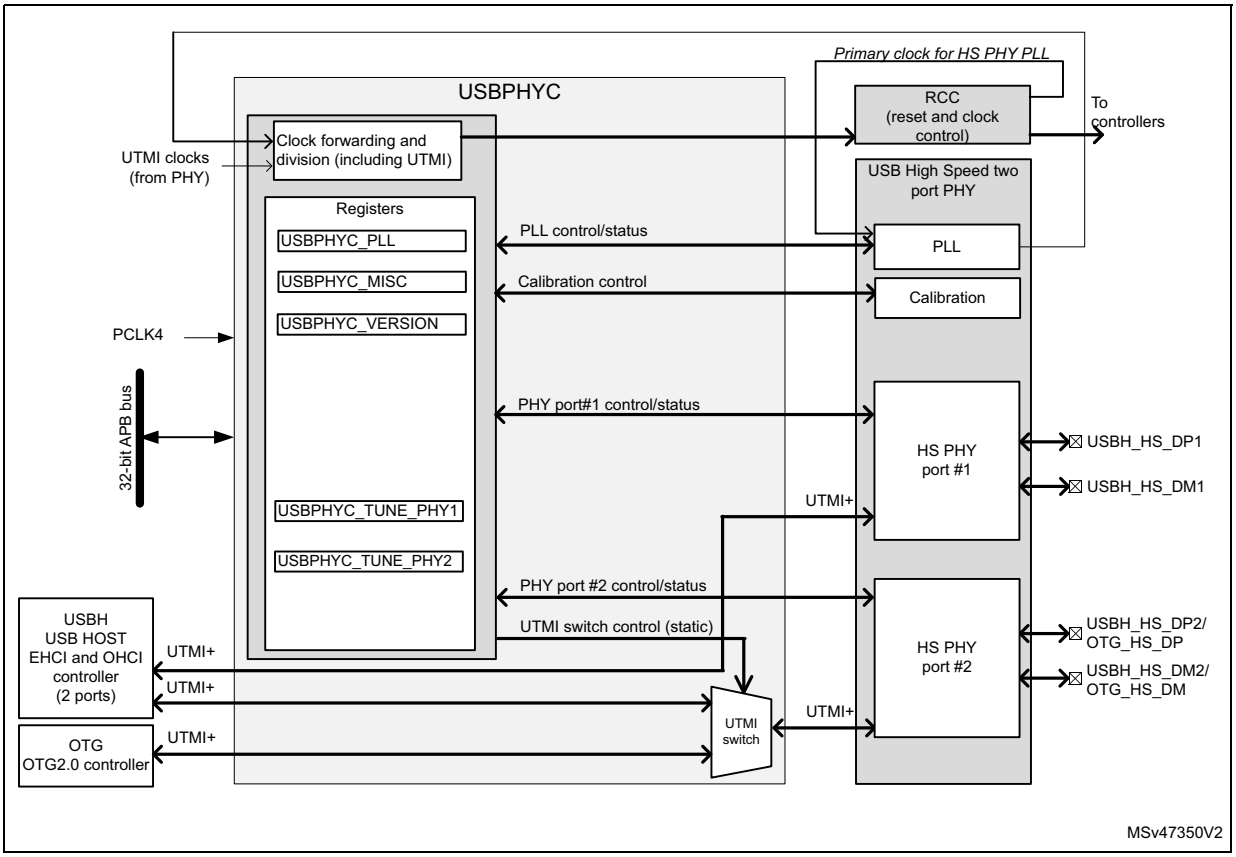
The USB HS PHY control block

- Controls the UTMI+ switch to share one port of the PHY between two controllers
- Sets the PLL values
- Sets other controls (and monitors) on the PHY

### 61.3.1 USBPHYC block diagram

The USBPHYC registers and main functions are shown in *Figure 768: USBPHYC block diagram*.

**Figure 768. USBPHYC block diagram**



## 61.3.2 USBPHYC reset and clocks

The USBPHYC is an APB peripheral. The USBPHYC logic is clocked directly by the PCLK4 clock of the APB bus interface. The registers are reset by the APB bus reset.

The list of other clocks available within the USBPHYC (not used for clocking the logic) is provided hereafter:

Input clocks (all coming from PLL section of the PHY):

- 60 MHz from PLL (for use as free running clock)
- 48 MHz from PLL (used for USB full speed PHY functions)
- UTMI clocks from each port (for controllers)

Output clocks used for muxing with other options and gating (all going to the RCC):

- 60 MHz
- 48 MHz
- 12 MHz (derived from 48 MHz)
- UTMI clocks (corresponding to each port), for distribution in the RCC to the relevant controllers (associated to each PHY port)

## 61.3.3 PLL control

The PLL should normally be configured according to requirements before setting PLLEN=1.

The fractional division mode is not enabled by default. In order to use it PLLFRACCTL should first be set and then the fractional part of the division control can be configured using different possible methods.

With the first method, PLLSTRB should be kept high for at least two cycles of the PLL input clock because the loading of control bits occurs at FBCLK transition (and these transitions cannot be monitored). In addition, the control bits should be stable for at least 3 clock cycles of the input clock after asserting PLLSTRB.

With the second method PLLSTRB should be bypassed by setting PLLSTRBBYP = 1. In this case, the control bits PLLFRACCTL and PLLFRACIN need to be static. The control bits should be changed only when the PLL is in power-down mode (PLLEN=0).

The loading of the control bits using PLLSTRB can be done only when the PLL is in coarse lock state (LOCKP = 1). When PLLSTRBBYP is low, the fractional bits are reset as soon as the PLL is unlocked. To load the fractional control bits, PLLSTRB should be asserted only after the lock is achieved (after a delay of 100 micro seconds).

The recommended approach for fractional division is thus to set all controls to the required values and PLLSTRBBYP=1, before setting PLLEN=1 to start the PLL.

# 61.4 USBPHYC registers

## 61.4.1 USBPHYC PLL control register (USBPHYC_PLL)

This register is used to control the PLL of the HS PHY.

Address offset: 0x000

Reset value: 0xC000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PLLDITHEN1 | PLLDITHEN0 | PLLFRACCTL | PLLSTRBYP | PLLSTRB | PLLEN | PLLFRACIN[15:6] | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PLLFRACIN[5:0] | | | | | | PLLODF[2:0] | | | PLLNDIV[6:0] | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **PLLDITHEN1**: PLL dither 1 (rectangular)

This bit enables the rectangular dither for the PLL.

0: Enables the rectangular PDF dither input to SDM of PLL (not recommended)

1: Disables the rectangular PDF dither input to SDM of PLL

Bit 30 **PLLDITHEN0**: PLL dither 2 (triangular)

This bit enables the triangular dither for the PLL.

0: Enables the triangular PDF dither input to SDM of PLL (not recommended)

1: Disables the triangular PDF dither input to SDM of PLL

Bit 29 **PLLFRACCTL**: PLL fractional mode control

0: Fractional mode off

1: Fractional mode on

Bit 28 **PLLSTRBYP**: PLL strobe bypass

Bypass the strobe signal. If set to 1 before setting PLLEN=1, then the PLL will start up in fractional mode depending on the setting of PLLFRACCTL.

0: Do not bypass the strobe signal

1: Bypass the strobe signal

Bit 27 **PLLSTRB**: PLL strobe

This bit allows to control an asynchronous strobe signal provided as an input to the fractional controller. A rising edge of PLLSTRB signal indicates to the fractional controller that a new fractional word is to be loaded.

0: Strobe set to 0

1: Strobe set to 1

Bit 26 **PLLEN**: PLL enable

This bit enables the PLL.

0: PLL disabled

1: PLL enabled

Bits 25:10 **PLLFRACIN[15:0]**: PLL fractional input
PLLFRACIN is the fractional input of the PLL divider.

Bits 9:7 **PLLODF[2:0]**: PLL output division factor

Bits 6:0 **PLLNDIV[6:0]**: Loop division factor of PLL (integer part)

### 61.4.2 USBPHYC misc control register (USBPHYC_MISC)

This register is used to control the switch between controllers for the HS PHY.

Address offset: 0x008

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PPCKDIS[1:0] | | SWITHOST |
| | | | | | | | | | | | | | rw | rw | rw |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:1 **PPCKDIS[1:0]**: Intelligent per HS PHY port clock gating control

This register is static.

0x0:No clock gating. PHY dedicated 60 MHz Port1/Port2 clocks are always delivered to target controller. PHY 48 MHz output clock is always delivered to target controller.

0x1:Intelligent clock gating for Port1. Port1 60 MHz input clock gated (Port1 is unused). Port2 dedicated 60 MHz is delivered in case of parallel data comm is requested on target controller (Host or OTG). PHY 48 MHz is delivered in case serial comm is requested on target controller (Host if SWITHOST = 1 else OTG).

0x2: Intelligent clock gating for Port2. Port2 60 MHz input clock gated (Port2 is unused). Port1 dedicated 60 MHz is delivered in case of parallel data comm is requested on target controller (Host). PHY 48 MHz is delivered in case serial comm is requested on target controller (Host if SWITHOST = 1 else OTG).

0x3:Intelligent clock gating for Port1 and Port2. Port1 dedicated 60 MHz is delivered in case of parallel data comm is requested on target (Host). Port2 dedicated 60 MHz is delivered in case of parallel data comm is requested on target (Host if SWITHOST = 1 else OTG). PHY 48 MHz output clock is delivered in case serial comm is requested on target controller (Host or OTG).

Bit 0 **SWITHOST**: Switch host

Controls main switch connecting USB PHY 2nd port between USB host controller and USB OTG controller. This register is static.

0: Select OTG controller for 2nd PHY port

1: Select Host controller for 2nd PHY port

### 61.4.3 USBPHYC PHY x TUNE register (USBPHYC_TUNEx)

This register is used to control the tune interface of the HS PHY, port #x.

Address offset: 0x10C + 0x100 * (x-1), (x = 1 to 2)

Reset value: 0x0407 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | STAGSEL | SHTCCTCTLPROT | HSFALLPREEM | HSRXOFF[1:0] | | HDRXGNEQEN | SQLCHCTL[1:0] | | OTPCOMP[4:1] | | | |
| | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| OTP COMP [0] | HSDRVCHKZTRM[1:0] | | HSDRVCHKITRM[3:0] | | | | HSDRVRFRED | FSDRVRFADJ | HSDRVCURINCR | HSDRVDCLEV | HSDRVDCCUR | HSDRVSLEW | LFSCAPEN | INCURRINT | INCURREN |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **STAGSEL**: Staggering selection
This bit enables the HS Tx staggering.
0: Disable the basic staggering in HS Tx mode
1: Enable the basic staggering in HS Tx mode

Bit 26 **SHTCCTCTLPROT**: Short circuit control protection
This bit enables the short circuit protection circuitry in LS/FS driver.
0: Short circuit protection disabled
1: Short circuit protection enabled

Bit 25 **HSFALLPREEM**: HS fall time pre-emphasis
This bit enables the HS fall time control of single ended signals during pre-emphasis:
0: Control On
1: Control Off

Bits 24:23 **HSRXOFF[1:0]**: HS receiver offset adjustment
0x0: No offset
0x1: Offset +5 mV
0x2: Offset +10 mV
0x3: Offset -5 mV

Bit 22 **HDRXGNEQEN**: Enable HS Rx gain equalizer
0: Disable the gain equalizer
1: Enable the gain equalizer

Bits 21:20 **SQLCHCTL[1:0]**: Squelch control
This bitfield adjusts the squelch DC threshold value.
0x0: No shift in threshold
0x1: Squelch DC threshold shift by +7 mV
0x2: Squelch DC threshold shift by -5 mV
0x3: Squelch DC threshold shift by +14 mV

Bits 19:15 **OTPCOMP[4:0]**: OTP compensation code

Bits 14:13 **HSDRVCHKZTRM[1:0]**: HS driver choke impedance trim
This bitfield controls the PHY bus HS driver impedance tuning for choke compensation.
0x0: No impedance offset
0x1: Reduce the impedance by 2 Ω
0x2: Reduce the impedance by 4 Ω
0x3: Reduce the impedance by 6 Ω

Bits 12:9 **HSDRVCHKITRM[3:0]**: HS driver choke current trim
This bitfield controls the HS driver current trimming pins for choke compensation.
0x0: 18.87 mA target current / nominal + 0%
0x1: 19.165 mA target current / nominal + 1.56%
0x2: 19.46 mA target current / nominal + 3.12%
0x3: 19.755 mA target current / nominal + 4.68%
0x4: 20.05 mA target current / nominal + 6.24%
0x5: 20.345 mA target current / nominal + 7.8%
0x6: 20.64 mA target current / nominal + 9.36%
0x7: 20.935 mA target current / nominal + 10.92%
0x8: 21.23 mA target current / nominal + 12.48%
0x9: 21.525 mA target current / nominal + 14.04%
0xA: 21.82 mA target current / nominal + 15.6%
0xB: 22.115 mA target current / nominal + 17.16%
0xC: 22.458 mA target current / nominal + 19.01%
0xD: 22.755 mA target current / nominal + 20.58%
0xE: 23.052 mA target current / nominal + 22.16%
0xF: 23.348 mA target current / nominal + 23.73%

Bit 8 **HSDRVRFRED**: High-speed rise-fall reduction enable
0: Default rise/fall time
1: Increases the rise/fall time by 20%

Bit 7 **FSDRVRFADJ**: Tuning pin to adjust the full speed rise/fall time
0: Disables the full speed rise/fall tuning option
1: Enables the full speed rise/fall tuning option

Bit 6 **HSDRVCURINCR**: Enable the HS driver current increase feature
0: Disables the HSDRVDCLEV feature
1: Enables the HSDRVDCLEV feature

Bit 5 **HSDRVDCLEV**: HS driver DC level
This bit allows to increase the HS driver DC level. I is not applicable during the HS test J and test K data transfer.
0: Increases the HS driver DC level by 5 to 7 mV if HSDRVCURINCR = '1'
1: Increases the HS driver DC level by 10 to 14 mV if HSDRVCURINCR = '1'

Bit 4 **HSDRVDCCUR**: HS driver DC level
This bit allows to decrease the HS driver DC level.
0: Keeps the normal HS driver DC level
1: Decreases the HS driver DC level by 5 to 7 mV

Bit 3 **HSDRVSLEW**: HS driver slew rate
This bit controls the HS driver slew rate.
0: Keeps the normal slew rate
1: Slows the driver slew rate by 10%

Bit 2 **LFSCAPEN**: Low full speed enable
This bit enables the low full speed feedback capacitor.
0: Disables the feedback capacitor.
1: Enables the feedback capacitor.

Bit 1 **INCURRINT**: Current boosting value
This bit controls the PHY current boosting value.
0: Provides a current boosting of 1mA if INCURREN = '1'
1: Provides a current boosting of 2mA if INCURREN = '1'

Bit 0 **INCURREN**:
The bit enables the current boosting function.
0: Disables the current boosting
1: Enables the current boosting

### 61.4.4 USBPHYC VERSION register (USBPHYC_VERR)

This register defines the version of this IP.

Address offset: 0xFFC

Reset value: 0x0000 0010

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

# 62 USB_EHCI/USB_OHCI high/full-speed link controller (USBH)

## 62.1 Introduction

The USBH is a USB host controller supporting the standard registers used for full-speed (OHCI controller) and high-speed (EHCI controller).

## 62.2 USBH main features

- Two physical ports supported using an on-chip 2-port high-speed PHY
- Supports OHCI model for full- and low-speed operation
- Supports EHCI model for high-speed operation
- LPM (link power management) support
- DMA engine with local 512 Byte packet buffer

The standards supported are:

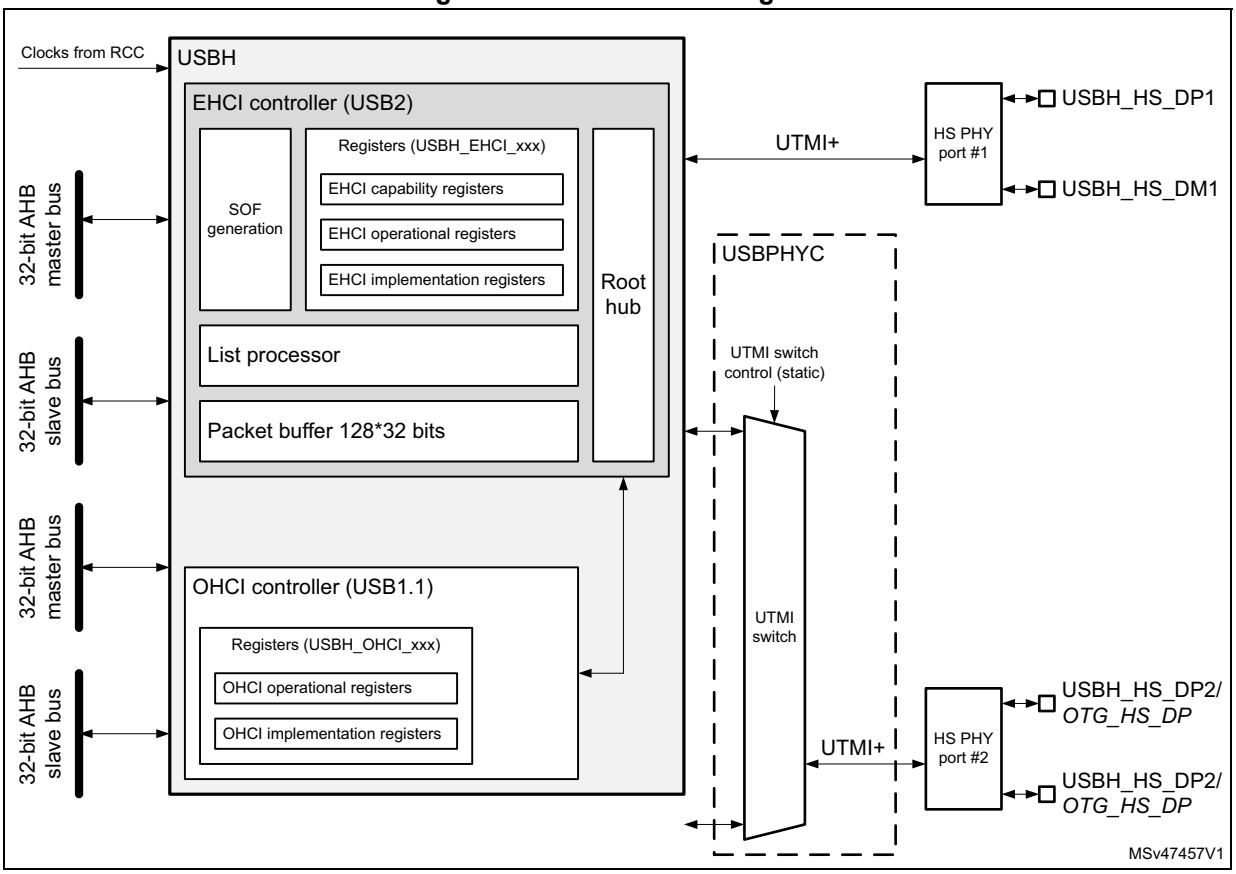
- Enhanced Host Controller Interface Specification for Universal Serial Bus, Revision 1.0, Intel Corp., March 12, 2002
  - http://www.intel.com
- EHCI 1.1 Addendum, Version 1.1, Intel Corp., August 2008
  - http://www.intel.com
- Open Host Controller Interface Specification for USB, Release 1.0a, Compaq, Inc., Microsoft Corp., National Semiconductor Corp., September 14, 1999
  - http://www.usb.org
- Universal Serial Bus Specification, Revision 2.0, USB Implementers Forum, Inc., April 27, 2000
  - http://www.usb.org
- USB 2.0 Transceiver Macrocell Interface (UTMI) Specification, Revision 1.05, Intel Corp., March 29, 2001
  - http://www.intel.com
- UTMI+ Specification, Revision 1.0, Philips Semiconductor, February 25, 2004
  - http://www.nxp.com

# 62.3 USBH functional description

## 62.3.1 USBH block diagram

The USBH block diagram is shown below:

**Figure 769. USBH block diagram**



## 62.3.2 USBH reset and clocks

USB requires both a functional AHB bus clock and functional USB clocks. The USB clocks are generated in USBPHYC (programming and enabling HS PHY's dedicated PLL). The RCC (reset and clock controller) controls clock gating and some multiplexing options. Refer to *Section 61: USB HS PHY controller (USBPHYC)* and *Section 10: Reset and clock control (RCC)* for full details on clock and reset control.

*Note: In order to access USBH_OHCI registers it is necessary to activate the USB clocks by enabling the PLL controlled by USBPHYC.*

## 62.3.3 Description of USBH packet buffer

The packet buffer provides storage and control for IN/OUT data. During OUT transactions, the system memory controller (inside the root hub) fetches data from the system memory and writes it here. During IN transactions, the root hub block writes the data. The packet buffer has a maximum depth of 512 bytes.

Packet buffer depth selection influences the system latency and bandwidth allocated to the EHCI host controller. For example, if the packet buffer depth is set to the maximum possible value i.e. 512 bytes, then for an IN transfer with USB packet size of 1024 bytes, there will be two (1024/512) data transfers on the AHB bus.

### 62.3.4 Description of USBH root hub

The USBH root hub propagates Reset and Resume signals to downstream ports and handles port connections and disconnections. In addition, the root hub is implemented with port router functionality to route the ports to either the EHCI host controller or OHCI host controller. The root hub operates on the local PHY clock, which operates on a free-running 60 MHz clock, and the clock source from each physical port, which operate at 60 MHz with an 8-bit interface.

## 62.4 USBH interrupts

Independent interrupts are generated from each controller:

- OHCI: usbh_ohci_it
  - HCI bus general interrupt (covers all 9 interrupt conditions covered by standard OHCI register HcInterruptStatus)
- EHCI: usbh_ehci_it
  - Interrupt async address
  - Host system error
  - Frame list rollover
  - Port change
  - USB error
  - USB interrupt

## 62.5 USBH registers

Note that USBH has two physical AHB slaves:

- USBH_OHCI (mapped to USBH_OHCI_BASE)
- USBH_EHCI (mapped to USBH_OHCI_BASE + 0x1000 offset)

USBH described here covers both slaves and to simplify, all offsets are defined here relative to the lowest system address base (i.e. that of the USBH_OHCI slave).

### 62.5.1 USBH OHCI standard registers

The OHCI core is implemented according USB 1.1 specification, release 1.0a. The standard OHCI operational registers are listed hereafter and in *Table 470: USBH register map and reset values* however their detailed description has been omitted in this document. Please refer to the standard documentation for the register description. In the following list of

registers, the prefix represents the address offset with respect to USBH_OHCI base address.

- [0x0000]: USBH_OHCI_HCREVISION
- [0x0004]: USBH_OHCI_HCCONTROL
- [0x0008]: USBH_OHCI_HCCOMMANDSTATUS
- [0x000C]: USBH_OHCI_HCINTERRUPTSTATUS
- [0x0010]: USBH_OHCI_HCINTERRUPTENABLE
- [0x0014]: USBH_OHCI_HCINTERRUPTDISABLE
- [0x0018]: USBH_OHCI_HCHCCA
- [0x001C]: USBH_OHCI_HCPERIODCURRENTED
- [0x0020]: USBH_OHCI_HCCONTROLHEADED
- [0x0024]: USBH_OHCI_HCCONTROLCURRENTED
- [0x0028]: USBH_OHCI_HCBULKHEADED
- [0x002C]: USBH_OHCI_HCBULKCURRENTED
- [0x0030]: USBH_OHCI_HCDONEHEAD
- [0x0034]: USBH_OHCI_HCFMINTERVAL
- [0x0038]: USBH_OHCI_HCFMREMAINING
- [0x003C]: USBH_OHCI_HCFMNUMBER
- [0x0040]: USBH_OHCI_PERIODICSTART
- [0x0044]: USBH_OHCI_HCLSTHRESHOLD
- [0x0048]: USBH_OHCI_HCRHDESCRIPTORA
- [0x004C]: USBH_OHCI_HCRHDESCRIPTORB
- [0x0050]: USBH_OHCI_HCRHSTATUS
- [0x0054]: USBH_OHCI_HCRHPORTSTATUS1
- [0x0058]: USBH_OHCI_HCRHPORTSTATUS2

### 62.5.2 USBH OHCI implementation register #6 (USBH_OHCI_INSNREG06)

Address offset: 0x0098

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| AHB_ ECAP | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 **AHB_ECAP**: AHB error captured

Indicator that an AHB error was encountered and values were captured. To clear this field the application must write a 0 to this register.

Bits 30:12 Reserved, must be kept at reset value.

Bits 11:9 **HBURST[2:0]**: HBURST value of the control phase at which the AHB error occurred

Bits 8:4 **EXP_BEATS[4:0]:** Number of expected beats

Number of beats expected in the burst where the AHB error occurred. Valid values are 0 and 4.

0: When no error, 0 is written to **EXP_BEATS[4:0]**.

4: When INCR4 and an error has occurred, 4 is written to **EXP_BEATS[4:0]**.

Other values except 4 are not written to **EXP_BEATS[4:0]**.

Bits 3:0 **SUC_BEATS[3:0]**: Number of successful beats

Number of successfully completed beats in the current burst before the AHB error has occurred.

### 62.5.3 USBH OHCI implementation register #7 (USBH_OHCI_INSNREG07)

Address offset: 0x009C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| AHB_MST_ERR[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| AHB_MST_ERR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **AHB_MST_ERR[31:0]**: AHB master error address

AHB address of the control phase at which the AHB error has occurred.

### 62.5.4 USBH EHCI standard registers

The EHCI core is implemented according USB 1.1 specification release 1.0a, and EHCI Addendum 1.1. The standard EHCI registers are listed hereafter and in *Table 470: USBH register map and reset values* however their detailed description has been omitted in this document. Please refer to the standard documentation for the register description. In the following list of registers, the prefix represents the address offset with respect to USBH_OHCI base address.

- EHCI capability registers:
  - [0x1000]: USBH_EHCI_HCICAPLENGTH
  - [0x1004]: USBH_EHCI_HCSPARAMS
  - [0x1008]: USBH_EHCI_HCCPARAMS
- EHCI functional registers
  - [0x1010]: USBH_EHCI_USBCMD
  - [0x1014]: USBH_EHCI_USBSTS
  - [0x1018]: USBH_EHCI_USBINTR
  - [0x101C]: USBH_EHCI_FRINDEX
  - [0x1024]: USBH_EHCI_PERIODICLISTBASE
  - [0x1028]: USBH_EHCI_ASYNCLISTADDR
  - [0x1050]: USBH_EHCI_CONFIGFLAG
  - [0x1054]: USBH_EHCI_PORTSC1
  - [0x1058]: USBH_EHCI_PORTSC2

### 62.5.5 USBH EHCI implementation register #1 (USBH_EHCI_INSNREG01)

This register controls the programmable packet buffer OUT/IN thresholds. The value specified here is the number of 32-bit words.

The OUT threshold is used to start the USB transfer as soon as the OUT threshold amount of data is fetched from system memory. It is also used to disconnect the data fetch, if the required space to hold the threshold amount of data is not available in the packet buffer.

The IN threshold is used to start the memory transfer as soon as the IN threshold amount of data is available in the packet buffer. It is also used to disconnect the data write, if the threshold amount of data is not available in the packet buffer.

The minimum OUT and IN threshold amount that can be programmed through INSN registers is 16 bytes. The minimum threshold amount that can be programmed is the highest possible INCRX burst value i.e. INCR16. The minimum OUT and IN threshold value should be 64 bytes (16×32-bit words).

OUT and IN threshold values can be equal to the packet buffer depth only when isochronous/interrupt transactions are not initiated by the host controller.

*Note: The break memory transfer bit is always enabled.*

*Note: Depending on packet buffer depth settings, the most significant bits may be unused.*

*Note: Power on reset sets these registers to reset values, soft reset does not affect these registers.*

Address offset: 0x1094

Reset value: 0x0020 0020

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **OUT_THRESHOLD[7:0]**: The value specified here is the number of 32-bit words

The OUT threshold is used to start the USB transfer as soon as the OUT_THRESHOLD amount of data is fetched from system memory. It is also used to disconnect the data fetch, if the required space to hold the threshold amount of data is not available in the packet buffer.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **IN_THRESHOLD[7:0]**: The value specified here is the number of 32-bit words

The IN threshold is used to start the memory transfer as soon as the IN_THRESHOLD amount of data is available in the packet buffer. It is also used to disconnect the data write, if the threshold amount of data is not available in the packet buffer.

### 62.5.6 USBH EHCI implementation register #2 (USBH_EHCI_INSNREG02)

Programmable packet buffer depth.

Address offset: 0x1098

Reset value: 0x0000 0080

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PKT_BUF[7:0]**: Programmable packet buffer depth

Programmable packet buffer depth.
The value specified here represents the number of 32-bit words.
Maximum valid packet buffer depth is 128 (32-bit words).

### 62.5.7 USBH EHCI implementation register #3 (USBH_EHCI_INSNREG03)

Address offset: 0x109C

Reset value: 0x0001 2001

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | EN_CLK256_CHECK | TESTSE_NAK | TX_TRA_DELAY[2:0] | | | FRM_LST_FETCH | TIME_AVAIL_OFF[7:0] | | | | | | | | BRK_MEM_TRANS |
| | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | r |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **ENABLE_LS_GLITCH**: Enable/disable enhancement for line state glitch

By default this enhancement is enabled.

0: disabled

1: enabled

Bit 15 Reserved, must be kept at reset value.

Bit 14 **EN_CLK256_CHECK**: Enable 256 clock checking

This bit controls the end of resume sequence of the EHCI host controller. By default, the value of this bit is 0 and during the end of resume sequence, the host controller waits for SE0 on the linestate before switching the PHY to high-speed.

When set to 1, during the end of resume sequence, the controller waits for SE0 or 256 clocks before switching the PHY to high-speed.

Setting this bit to 1, enables the 256 clock checking. Some of the UTMI PHYs do not present SE0 on the linestate during the end of resume sequence. For such PHYs, this bit should be set, so that the core does not wait forever for SE0.

This bit should be set only during initialization.

Bit 13 **TESTSE_NAK**: TestSE NAK

Ignore linestate during TestSE0 Nak

When set to 1 (default), the core ignores the linestate checking when transmitting SOF during the SE0_NAK test mode.

When set to 0, the port state machine disables the port if it does not find the linestate to be in SE0 when transmitting SOF during the SE0_NAK testing. While doing impedance measurement during the SE0_NAK testing, the linestate could go to non SE0 forcing the core to disable the port. This bit is used to control the port behavior during this state.

Bits 12:10 **TX_TRA_DELAY[2:0]**: Tx-Tx turnaround delay add on

This field specifies the extra delays in phy_clks to be added to the "Transmit to Transmit turnaround delay" value maintained in the core. The default value of this register field is 0. This default value of 0 is sufficient for most PHYs. But for some PHYs that put wait states during the token packet, it may be required to program a value greater than 0 to meet the transmit to transmit minimum turnaround time. The recommendation is to use the default value of 0 and change it only if there is an issue with minimum transmit-to-transmit turnaround time. This value should be programmed during core initialization and should not be changed afterwards.

Bit 9 **FRM_LST_FETCH**:

Setting this bit will force the host controller to fetch the periodic frame list in every microframe of a frame. If not set, then the periodic frame list will be fetched only in microframe 0 of every frame.

The default is 0 (not set). This bit can be changed only during core initialization and should not be changed afterwards.

Bits 8:1 **TIME_AVAIL_OFF[7:0]**: Time available offset

This value indicates the additional number of bytes to be accommodated for the time-available calculation.

The USB traffic on the bus can be started only when sufficient time is available to complete the packet within the EOF1 point. Refer to the USB 2.0 specification for details of the EOF1 point.

This time-available calculation is done in the hardware, and can be further offset by programming a value in this location.

*Note: Time-available calculation is added for future flexibility. The application is not required to program this field by default.*

Bit 0 **BRK_MEM_TRANS**: Break memory transfer

Used in conjunction with EHCI_H_INSNREG01 to enable breaking memory transactions into chunks once the OUT/IN threshold value is reached. Value is fixed to 1.

## 62.5.8 USBH EHCI implementation register #4 (USBH_EHCI_INSNREG04)

Address offset: 0x10A0

Reset value: 0x0000 0000

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SUSPEND_SIGNAL | Res. | Res. | Res. | HCCPARAMS_WRT | HCSPARAMS_WRT |
| | | | | | | | | | | rw | | | | rw | rw |

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **SUSPEND_SIGNAL**: Suspend signal

0: By default, the automatic feature is enabled. The suspend signal is de-asserted (logic level 1) when run/stop is reset by software, but the HCH (hchalted) bit is not yet set.

1: Disables the automatic feature, which takes all ports out of suspend when software clears the run/stop bit. This is for backward compatibility.

For systems where the host is halted without waking up all ports out of suspend, the port can become stuck because the clock coming from the PHY is not running when the halt is programmed. To avoid this, the EHCI automatically pulls ports out of suspend when the host is halted by software. This bit is used to disable this automatic function.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **HCCPARAMS_WRT**:

When this bit is 1, the USBH_EHCI_HCCPARAMS register bits 17, 15:4, and 2:0 become writable.

Bit 0 **HCSPARAMS_WRT**:

When this bit is 1, the USBH_EHCI_HCSPARAMS register becomes writable.

## 62.5.9 USBH EHCI implementation register #5 (USBH_EHCI_INSNREG05)

Address offset: 0x10A4

Reset value: 0x0000 1000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **VBUSY**: UTMI VBUSY

VBusy (read only). Hardware indicator that a write to this register has occurred and the hardware is currently processing the operation defined by the data written. When processing is finished, this bit is cleared.

Bits 16:13 **VPORT[3:0]**: UTMI VPORT

VPort (read write). Valid values for write are only 1 and 2. No other values should be written to this field. Supposing an illegal value, say 4, is written, any subsequent writes to this register are ignored and the read value will always be the initial illegal value written (in this case 4).

Bit 12 **VCONTROL_LDM:** UTMI VCONTROLLoad (vendor control load)
Refer to the UTMI specification for detailed usage.
0: Load
1: NOP

Bits 11:8 **VCONTROL[3:0]**: UTMI VCONTROL (vendor control)
Vendor defined 4-bit parallel input bus. Refer to the UTMI specification for detailed usage.

Bits 7:0 **VSTATUS[7:0]**: UTMI VStatus (vendor status)
Refer to the UTMI specification for detailed usage.

### 62.5.10 USBH EHCI implementation register #6 (USBH_EHCI_INSNREG06)

Address offset: 0x10A8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 **AHB_ECAP**: AHB error captured
Indicator that an AHB error was encountered and values were captured. To clear this field the application must write a 0 to this bit.

Bits 30:12 Reserved, must be kept at reset value.

Bits 11:9 **HBURST[2:0]**: HBURST value of the control phase at which the AHB error occurred

Bits 8:4 **EXP_BEATS[4:0]:** Number of expected beats
Number of beats expected in the burst at which the AHB error has occurred. Valid values are 0 to 16.
0: When no error, 0 is written to **EXP_BEATS[4:0]**.
4: When INCR4 and error has occurred, 4 is written to **EXP_BEATS[4:0]**
8: When INCR8 and error has occurred, 8 is written to **EXP_BEATS[4:0]**
16: When INCR16 and error has occurred,16 is written to **EXP_BEATS[4:0]**
Other values except 4, 8, and 16 are not written to **EXP_BEATS[4:0]**

Bits 3:0 **SUC_BEATS[3:0]**: Number of successful beats
Number of successfully-completed beats in the current burst before the AHB error has occurred.

### 62.5.11 USBH EHCI implementation register #7 (USBH_EHCI_INSNREG07)

# 63 HDMI-CEC controller (CEC)

## 63.1 Introduction

Consumer electronics control (CEC) is part of HDMI (high-definition multimedia interface) standard as appendix supplement 1. It contains a protocol that provides high-level control functions between various audiovisual products. CEC operates at low speeds, with minimum processing and memory overhead.

The HDMI-CEC controller provides hardware support for this protocol.

## 63.2 HDMI-CEC controller main features

- Complies with HDMI-CEC v1.4 specification
- Independent 32 kHz CEC kernel (refer to *Section RCC kernel clock distribution*)
- Works in Stop mode for ultra-low-power applications
- Configurable signal-free time before start of transmission
  - Automatic by hardware, according to CEC state and transmission history
  - Fixed by software (7 timing options)
- Configurable peripheral address (OAR)
- Supports Listen mode
  - Enables reception of CEC messages sent to destination address different from OAR without interfering with the CEC line
- Configurable Rx-tolerance margin
  - Standard tolerance
  - Extended tolerance
- Receive-error detection
  - Bit rising error (BRE), with optional stop of reception (BRESTP)
  - Short bit period error (SBPE)
  - Long bit period error (LBPE)
- Configurable error-bit generation
  - on BRE detection (BREGEN)
  - on LBPE detection (LBPEGEN)
  - always generated on SBPE detection
- Transmission error detection (TXERR)
- Arbitration lost detection (ARBLST)
  - With automatic transmission retry
- Transmission underrun detection (TXUDR)
- Reception overrun detection (RXOVR)

## 63.3 HDMI-CEC functional description

### 63.3.1 HDMI-CEC pin and internal signals

The CEC bus consists of a single bidirectional line that is used to transfer data in and out of the device. It is connected to a +3.3 V supply voltage via a 27 kΩ pull-up resistor. The output stage of the device must have an open-drain or open-collector to allow a wired-AND connection.

The HDMI-CEC controller manages the CEC bidirectional line as an alternate function of a standard GPIO, assuming that it is configured as alternate function open drain. The 27 kΩ pull-up must be added externally to the microcontroller.

To not interfere with the CEC bus when the application power is removed, it is mandatory to isolate the CEC pin from the bus in such conditions. This can be done by using a MOS transistor, as shown on *Figure 770*.

*Table 472* lists the internal signals that are exchanged between the HDMI-CEC and other functional blocks (such as RCC and EXTI).

**Table 471. HDMI pin**

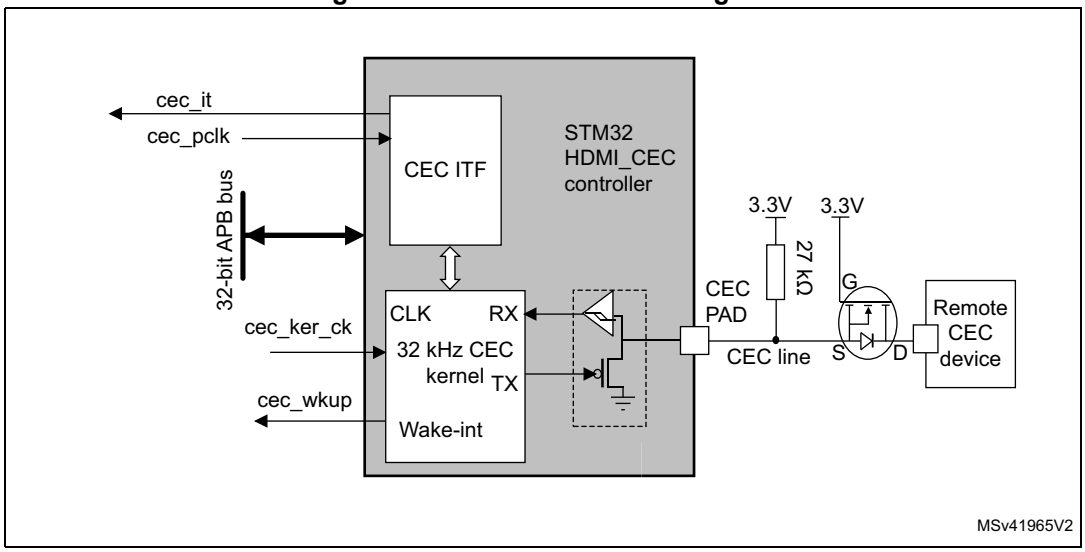
| Name | Signal type | Remarks |
|---|---|---|
| CEC | Bidirectional | Two states:<br>– 1 = high impedance<br>– 0 = low impedance<br>A 27 kΩ resistor must be added externally. |

**Table 472. HDMI-CEC internal input/output signals**

| Signal name | Signal type | Description |
|---|---|---|
| cec_wkup | Digital output | HDMI-CEC wakeup signal |
| cec_it | Digital output | HDMI-CEC interrupt signal |
| cec_pclk | Digital input | APB clock |
| cec_ker_ck | Digital input | HDMI-CEC kernel clock |

### 63.3.2 HDMI-CEC block diagram

**Figure 770. HDMI-CEC block diagram**



### 63.3.3 Message description

All transactions on the CEC line consist of an initiator and one or more followers. The initiator is responsible for sending the message structure and the data. The follower is the recipient of any data and is responsible for setting any acknowledgment bits.

A message is conveyed in a single frame that consists of a start bit followed by a header block and optionally an opcode and a variable number of operand blocks.

All these blocks are made of a 8-bit payload - most significant bit is transmitted first - followed by an end of message (EOM) bit and an acknowledge (ACK) bit.

The EOM bit is set in the last block of a message and kept reset in all others. In case a message contains additional blocks after an EOM is indicated, those additional blocks must be ignored. The EOM bit may be set in the header block to ‘ping’ other devices, to make sure they are active.

The acknowledge bit is always set to high impedance by the initiator so that it can be driven low either by the follower that has read its own address in the header, or by the follower that needs to reject a broadcast message.

The header consists of the source logical address field, and the destination logical address field. Note that the special address 0xF is used for broadcast messages.

**Figure 771. Message structure**

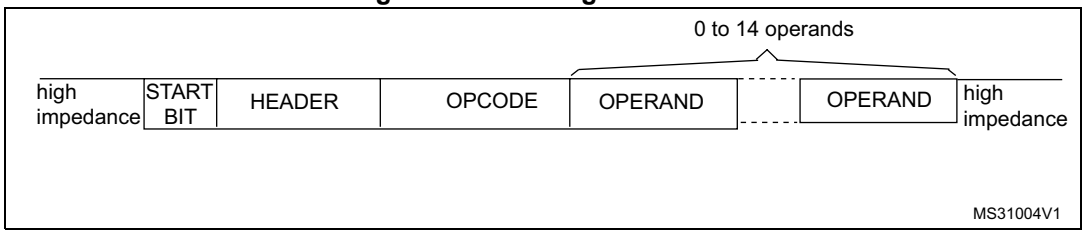


**Figure 772. Blocks**

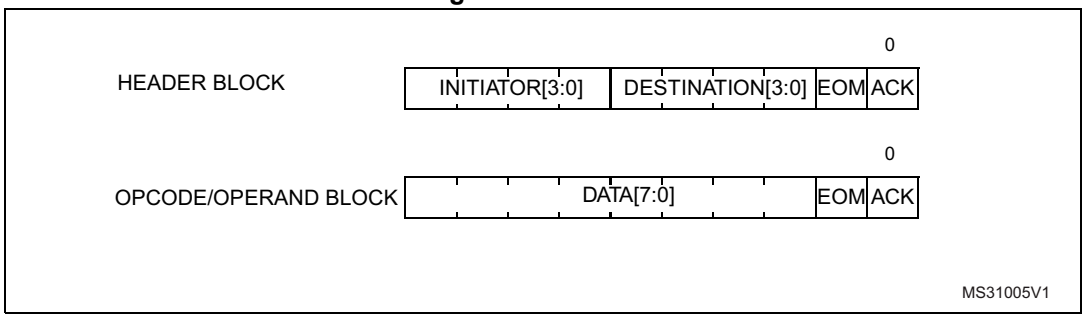
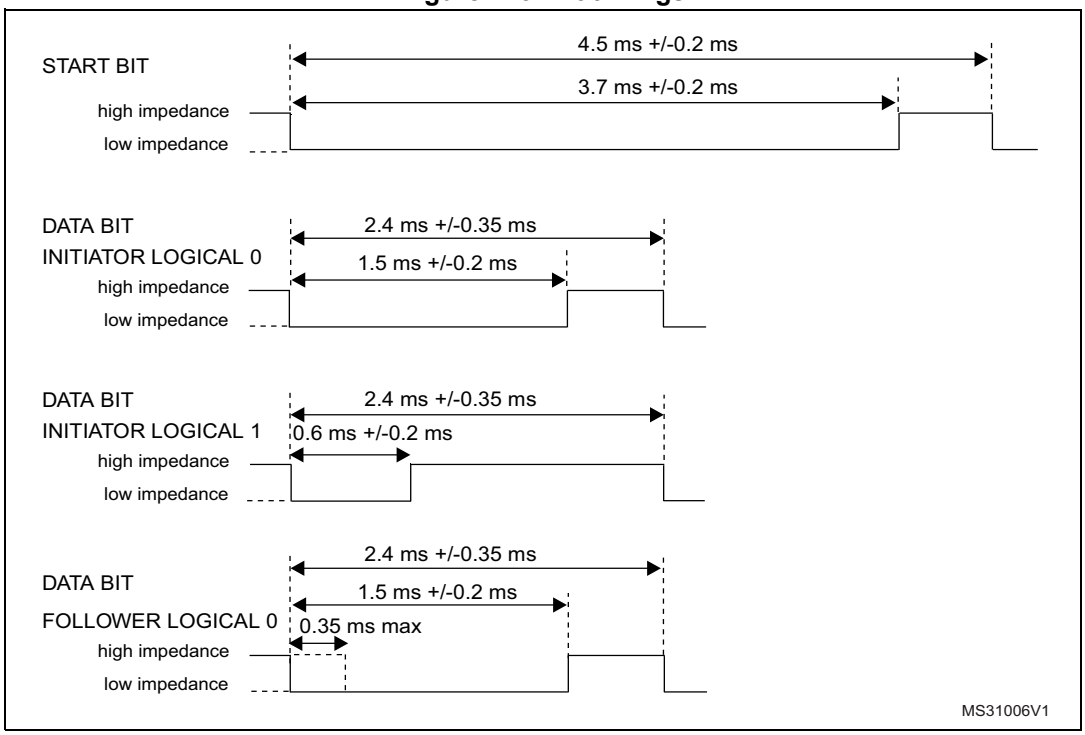


### 63.3.4 Bit timing

The format of the start bit is unique and identifies the start of a message. It must be validated by its low duration and its total duration.

All remaining data bits in the message, after the start bit, have consistent timing. The high-to-low transition at the end of the data bit is the start of the next data bit except for the final bit where the CEC line remains high.

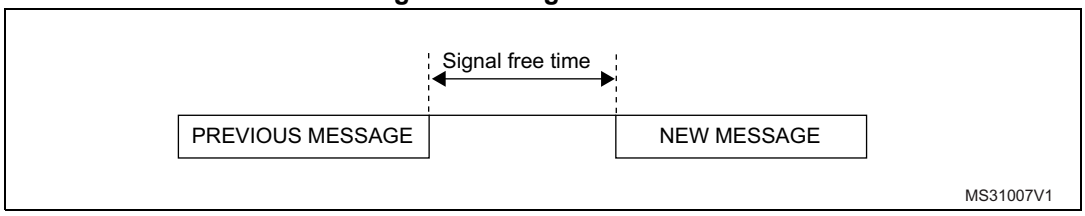
**Figure 773. Bit timings**



## 63.4 Arbitration

All devices transmitting - or retransmitting - a message onto the CEC line must ensure that it has been inactive for a number of bit periods. This signal-free time is defined as the time starting from the final bit of the previous frame and depends on the initiating device and the current status as shown in the table below.

**Figure 774. Signal free time**



Since only one initiator is allowed at any one time, an arbitration mechanism is provided to avoid conflict when more than one initiator begins transmitting at the same time.

CEC line arbitration starts with the leading edge of the start bit and continues until the end of the initiator address bits within the header block. During this period, the initiator must monitor the CEC line, if whilst driving the line to high impedance it reads it back to 0. Assuming then it has lost arbitration, it stops transmitting and becomes a follower.

**Figure 775. Arbitration phase**

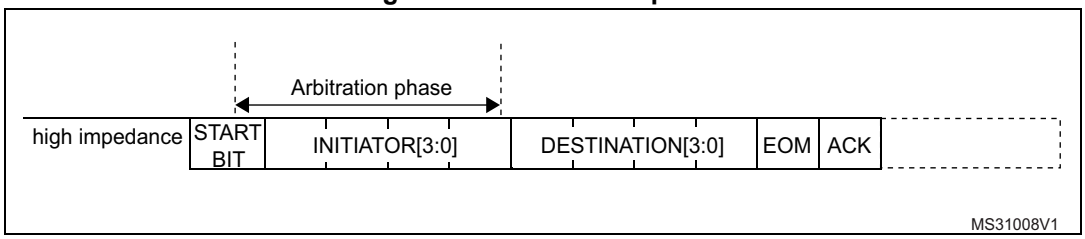


*Figure 776* shows an example for a SFT of three nominal bit periods

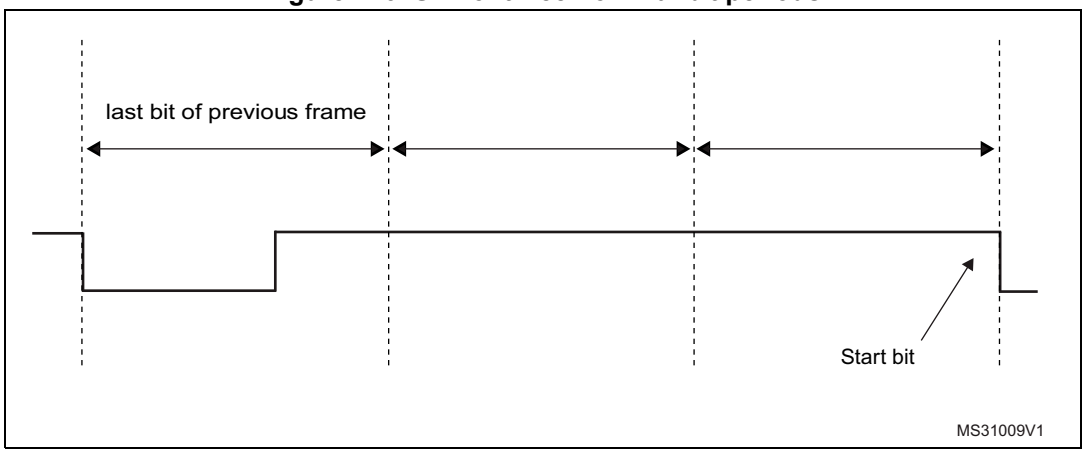
**Figure 776. SFT of three nominal bit periods**



A configurable time window is counted before starting the transmission.

In the SFT = 0 configuration, HDMI-CEC performs automatic SFT calculation ensuring compliance with the HDMI-CEC standard:

- 2.5 data bit periods if the CEC is the last bus initiator with unsuccessful transmission
- 4 data bit periods if the CEC is the new bus initiator
- 6 data bit periods if the CEC is the last bus initiator with successful transmission

This is done to guarantee the maximum priority to a failed transmission and the lowest one to the last initiator that completed successfully its transmission.

Otherwise there is the possibility to configure the SFT bits to count a fixed timing value. Possible values are 0.5, 1.5, 2.5, 3.5, 4.5, 5.5, 6.5 data bit periods.

### 63.4.1 SFT option bit

In case of SFTOPT = 0 configuration, SFT starts being counted when the start-of-transmission command is set by software (TXSOM=1).

In case of SFTOPT=1, SFT starts automatically being counted by the HDMI-CEC device when a bus-idle or line error condition is detected. If the SFT timer is completed at the time TXSOM command is set then transmission starts immediately without latency. If the SFT timer is still running instead, the system waits until the timer elapses before transmission can start.

In case of SFTOPT = 1 a bus-event condition starting the SFT timer is detected in the following cases:

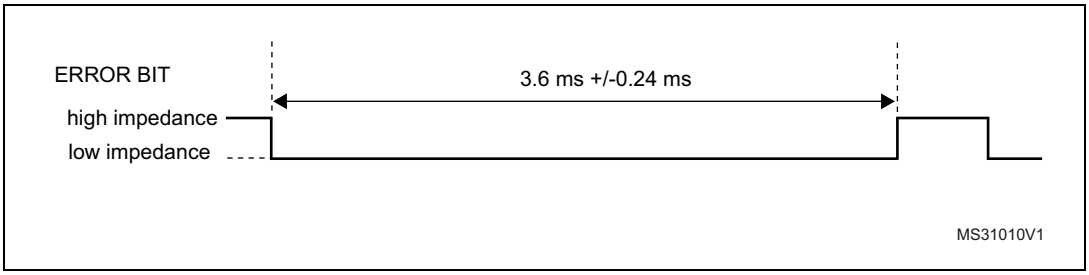
- In case of a regular end of transmission/reception, when TXEND/RXEND bits are set at the minimum nominal data bit duration of the last bit in the message (ACK bit).
- In case of a transmission error detection, SFT timer starts when the TXERR transmission error is detected (TXERR=1).
- In case of a missing acknowledge from the CEC follower, the SFT timer starts when the TXACKE bit is set, that is at the nominal sampling time of the ACK bit.
- In case of a transmission underrun error, the SFT timer starts when the TXUDR bit is set at the end of the ACK bit.
- In case of a receive error detection implying reception abort, the SFT timer starts at the same time the error is detected. If an error bit is generated, then SFT starts being counted at the end of the error bit.
- In case of a wrong start bit or of any uncodified low impedance bus state from idle, the SFT timer is restarted as soon as the bus comes back to hi-impedance idleness.

## 63.5 Error handling

### 63.5.1 Bit error

If a data bit - excluding the start bit - is considered invalid, the follower is expected to notify such error by generating a low bit period on the CEC line of 1.4 to 1.6 times the nominal data bit period, i.e. 3.6 ms nominally.

**Figure 777. Error bit timing**



### 63.5.2 Message error

A message is considered lost and therefore may be retransmitted under the following conditions:

- a message is not acknowledged in a directly addressed message
- a message is negatively acknowledged in a broadcast message
- a low impedance is detected on the CEC line while it is not expected (line error)

Three kinds of error flag can be detected when the CEC interface is receiving a data bit:

### 63.5.3 Bit Rising Error (BRE)

BRE (bit rising error): is set when a bit rising edge is detected outside the windows where it is expected (see *Figure 778*). BRE flag also generates a CEC interrupt if the BREIE=1.

In the case of a BRE detection, the message reception can be stopped according to the BRESTP bit value and an error bit can be generated if BREGEN bit is set.

When BRE is detected in a broadcast message with BRESTP=1 an error bit is generated even if BREGEN=0 to enforce initiator's retry of the failed transmission. Error bit generation can be disabled by configuring BREGEN=0, BRDNOGEN=1.

### 63.5.4 Short Bit Period Error (SBPE)

SBPE is set when a bit falling edge is detected earlier than expected (see *Figure 778*). SBPE flag also generates a CEC interrupt if the SBPEIE=1.

An error bit is always generated on the line in case of a SBPE error detection. An Error Bit is not generated upon SBPE detection only when Listen mode is set (LSTN=1) and the following conditions are met:

- A directly addressed message is received containing SBPE
- A broadcast message is received containing SBPE AND BRDNOGEN=1

### 63.5.5 Long Bit Period Error (LBPE)

LBPE is set when a bit falling edge is not detected in a valid window (see *Figure 778*). LBPE flag also generates a CEC interrupt if the LBPEIE=1.

LBPE always stops the reception, an error bit is generated on the line when LBPEGEN bit is set.

When LBPE is detected in a broadcast message an error bit is generated even if LBPEGEN=0 to enforce initiator's retry of the failed transmission. Error bit generation can be disabled by configuring LBPEGEN=0, BRDNOGEN=1.

*Note: The BREGEN=1, BRESTP=0 configuration must be avoided*

**Figure 778. Error handling**

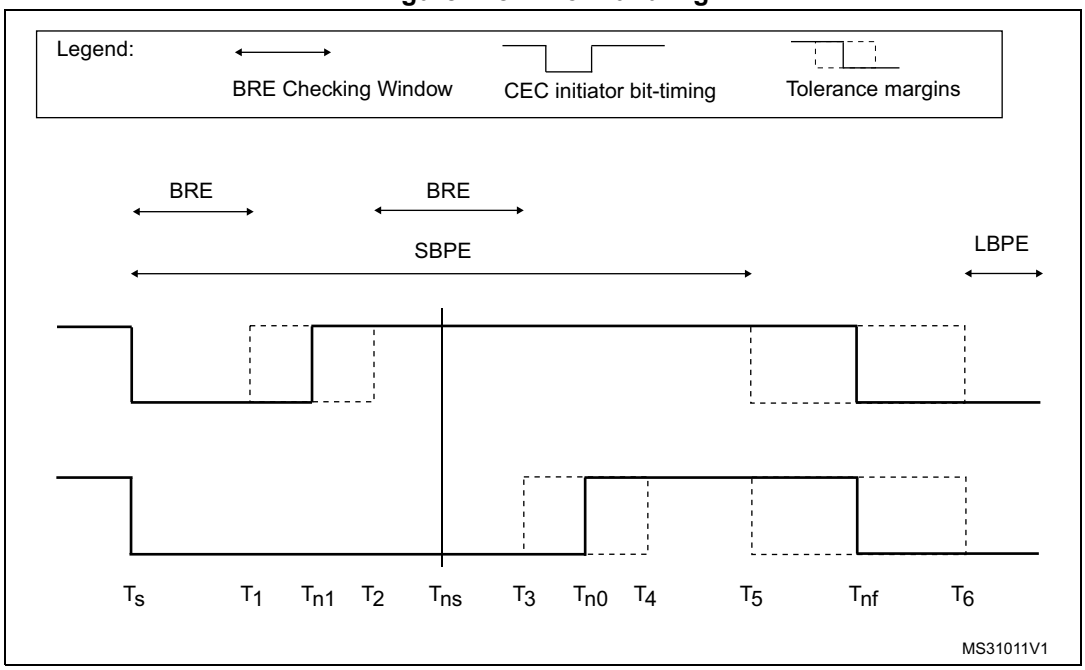


**Table 473. Error handling timing parameters**

| Time | RXTOL | ms | Description |
|---|---|---|---|
| $T_s$ | x | 0 | Bit start event. |
| $T_1$ | 1 | 0.3 | The earliest time for a low - high transition when indicating a logical 1. |
| | 0 | 0.4 | |
| $T_{n1}$ | x | 0.6 | The nominal time for a low - high transition when indicating a logical 1. |
| $T_2$ | 0 | 0.8 | The latest time for a low - high transition when indicating a logical 1. |
| | 1 | 0.9 | |
| $T_{ns}$ | x | 1.05 | Nominal sampling time. |
| $T_3$ | 1 | 1.2 | The earliest time a device is permitted return to a high impedance state (logical 0). |
| | 0 | 1.3 | |
| $T_{n0}$ | x | 1.5 | The nominal time a device is permitted return to a high impedance state (logical 0). |

**Table 473. Error handling timing parameters (continued)**

| Time | RXTOL | ms | Description |
|---|---|---|---|
| $T_4$ | 0 | 1.7 | The latest time a device is permitted return to a high impedance state (logical 0). |
| | 1 | 1.8 | |
| $T_5$ | 1 | 1.85 | The earliest time for the start of a following bit. |
| | 0 | 2.05 | |
| $T_{nf}$ | x | 2.4 | The nominal data bit period. |
| $T_6$ | 0 | 2.75 | The latest time for the start of a following bit. |
| | 1 | 2.95 | |

### 63.5.6 Transmission Error Detection (TXERR)

The CEC initiator sets the TXERR flag if detecting low impedance on the CEC line when it is transmitting high impedance and is not expecting a follower asserted bit. TXERR flag also generates a CEC interrupt if the TXERRIE=1.

TXERR assertion stops the message transmission. Application is in charge to retry the failed transmission up to 5 times.

TXERR checks are performed differently depending on the different states of the CEC line and on the RX tolerance configuration.

**Figure 779. TXERR detection**

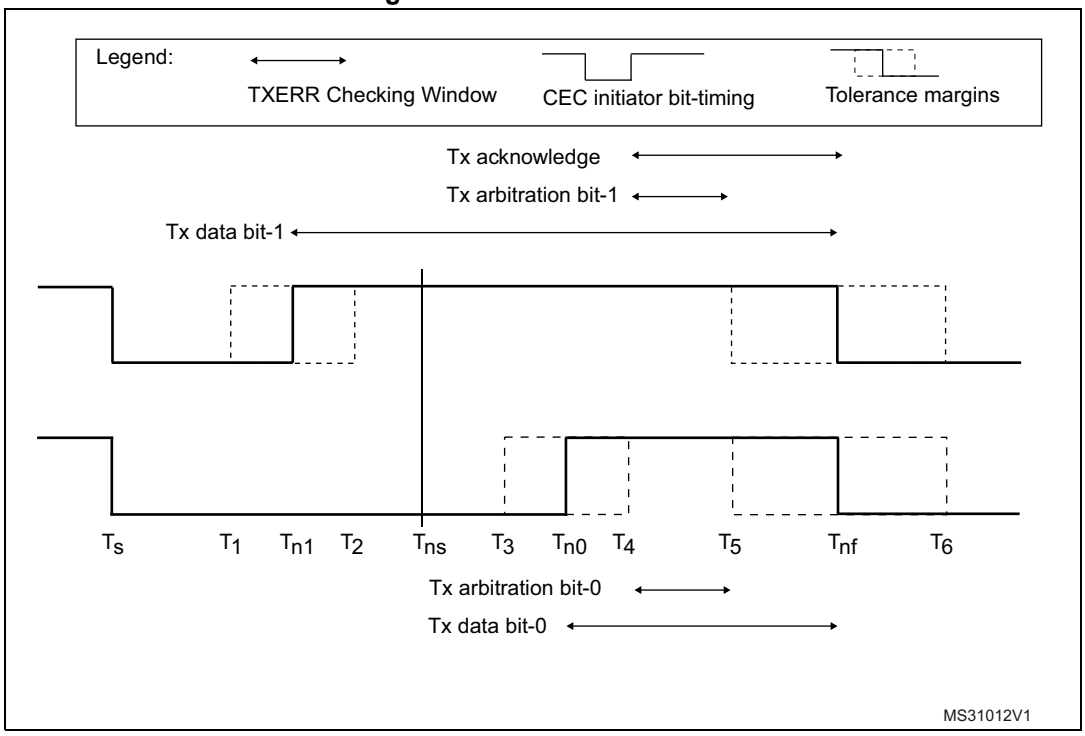

**Table 474. TXERR timing parameters**

| Time | RXTOL | ms | Description |
|---|---|---|---|
| $T_s$ | x | 0 | Bit start event. |
| $T_1$ | 1 | 0.3 | The earliest time for a low - high transition when indicating a logical 1. |
| | 0 | 0.4 | |
| $T_{n1}$ | x | 0.6 | The nominal time for a low - high transition when indicating a logical 1. |
| $T_2$ | 0 | 0.8 | The latest time for a low - high transition when indicating a logical 1. |
| | 1 | 0.9 | |
| $T_{ns}$ | x | 1.05 | Nominal sampling time. |
| $T_3$ | 1 | 1.2 | The earliest time a device is permitted return to a high impedance state (logical 0). |
| | 0 | 1.3 | |

**Table 474. TXERR timing parameters (continued)**

| Time | RXTOL | ms | Description |
|---|---|---|---|
| $T_{n0}$ | x | 1.5 | The nominal time a device is permitted return to a high impedance state (logical 0). |
| $T_4$ | 0 | 1.7 | The latest time a device is permitted return to a high impedance state (logical 0). |
| | 1 | 1.8 | |
| $T_5$ | 1 | 1.85 | The earliest time for the start of a following bit. |
| | 0 | 2.05 | |
| $T_{nf}$ | x | 2.4 | The nominal data bit period. |
| $T_6$ | 0 | 2.75 | The latest time for the start of a following bit. |
| | 1 | 2.95 | |

## 63.6 HDMI-CEC interrupts

An interrupt can be produced:

- during reception if a Receive Block Transfer is finished or if a Receive Error occurs.
- during transmission if a Transmit Block Transfer is finished or if a Transmit Error occurs.

**Table 475. HDMI-CEC interrupts**

| Interrupt event | Event flag | Enable Control bit |
|---|---|---|
| Rx-Byte Received | RXBR | RXBRIE |
| End of reception | RXEND | RXENDIE |
| Rx-Overrun | RXOVR | RXOVRIE |
| RxBit Rising Error | BRE | BREIE |
| Rx-Short Bit Period Error | SBPE | SBPEIE |
| Rx-Long Bit Period Error | LBPE | LBPEIE |
| Rx-Missing Acknowledge Error | RXACKE | RXACKEIE |
| Arbitration lost | ARBLST | ARBLSTIE |
| Tx-Byte Request | TXBR | TXBRIE |
| End of transmission | TXEND | TXENDIE |
| Tx-Buffer Underrun | TXUDR | TXUDRIE |
| Tx-Error | TXERR | TXERRIE |
| Tx-Missing Acknowledge Error | TXACKE | TXACKEIE |

## 63.7 HDMI-CEC registers

Refer to *Section 1.2 on page 118* for a list of abbreviations used in register descriptions.

### 63.7.1 CEC control register (CEC_CR)

Address offset: 0x00

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TXEOM | TXSOM | CECEN |
| | | | | | | | | | | | | | rs | rs | rw |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TXEOM***:* Tx End Of Message

The TXEOM bit is set by software to command transmission of the last byte of a CEC message.
TXEOM is cleared by hardware at the same time and under the same conditions as for TXSOM.
0: TXDR data byte is transmitted with EOM=0
1: TXDR data byte is transmitted with EOM=1

*Note: TXEOM must be set when CECEN=1.*
*TXEOM must be set before writing transmission data to TXDR.*
*If TXEOM is set when TXSOM=0, transmitted message will consist of 1 byte (HEADER) only (PING message)*

Bit 1 **TXSOM**: Tx Start Of Message

TXSOM is set by software to command transmission of the first byte of a CEC message. If the CEC message consists of only one byte, TXEOM must be set before of TXSOM.
Start-Bit is effectively started on the CEC line after SFT is counted. If TXSOM is set while a message reception is ongoing, transmission will start after the end of reception.
TXSOM is cleared by hardware after the last byte of the message is sent with a positive acknowledge (TXEND=1), in case of transmission underrun (TXUDR=1), negative acknowledge (TXACKE=1), and transmission error (TXERR=1). It is also cleared by CECEN=0. It is not cleared and transmission is automatically retried in case of arbitration lost (ARBLST=1).
TXSOM can be also used as a status bit informing application whether any transmission request is pending or under execution. The application can abort a transmission request at any time by clearing the CECEN bit.
0: No CEC transmission is on-going
1: CEC transmission command

*Note: TXSOM must be set when CECEN=1.*
*TXSOM must be set when transmission data is available into TXDR.*
*HEADER first four bits containing own peripheral address are taken from TXDR[7:4], not from CEC_CFGR.OAR which is used only for reception.*

Bit 0 **CECEN:** CEC enable

The CECEN bit is set and cleared by software. CECEN=1 starts message reception and enables the TXSOM control. CECEN=0 disables the CEC peripheral, clears all bits of CEC_CR register and aborts any on-going reception or transmission.
0: CEC peripheral is off
1: CEC peripheral is on

## 63.7.2 CEC configuration register (CEC_CFGR)

This register is used to configure the HDMI-CEC controller.

Address offset: 0x04

Reset value: 0x0000 0000

**Caution:** It is mandatory to write CEC_CFGR only when CECEN=0.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| LSTN | OAR[14:0] | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **LSTN:** Listen mode

LSTN bit is set and cleared by software.

0: CEC peripheral receives only message addressed to its own address (OAR). Messages addressed to different destination are ignored. Broadcast messages are always received.

1: CEC peripheral receives messages addressed to its own address (OAR) with positive acknowledge. Messages addressed to different destination are received, but without interfering with the CEC bus: no acknowledge sent.

Bits 30:16 **OAR[14:0]:** Own addresses configuration

The OAR bits are set by software to select which destination logical addresses has to be considered in receive mode. Each bit, when set, enables the CEC logical address identified by the given bit position.

At the end of HEADER reception, the received destination address is compared with the enabled addresses. In case of matching address, the incoming message is acknowledged and received. In case of non-matching address, the incoming message is received only in listen mode (LSTN=1), but without acknowledge sent. Broadcast messages are always received.

Example:

OAR = 0b000 0000 0010 0001 means that CEC acknowledges addresses 0x0 and 0x5. Consequently, each message directed to one of these addresses is received.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **SFTOP**: SFT Option Bit

The SFTOPT bit is set and cleared by software.

0: SFT timer starts when TXSOM is set by software

1: SFT timer starts automatically at the end of message transmission/reception.

Bit 7 **BRDNOGEN:** Avoid Error-Bit Generation in Broadcast

The BRDNOGEN bit is set and cleared by software.

0: BRE detection with BRESTP=1 and BREGEN=0 on a broadcast message generates an Error-Bit on the CEC line. LBPE detection with LBPEGEN=0 on a broadcast message generates an Error-Bit on the CEC line

1: Error-Bit is not generated in the same condition as above. An Error-Bit is not generated even in case of an SBPE detection in a broadcast message if listen mode is set.

Bit 6 **LBPEGEN:** Generate Error-Bit on Long Bit Period Error

The LBPEGEN bit is set and cleared by software.

0: LBPE detection does not generate an Error-Bit on the CEC line

1: LBPE detection generates an Error-Bit on the CEC line

*Note: If BRDNOGEN=0, an Error-bit is generated upon LBPE detection in broadcast even if LBPEGEN=0*

Bit 5 **BREGEN:** Generate Error-Bit on Bit Rising Error

The BREGEN bit is set and cleared by software.

0: BRE detection does not generate an Error-Bit on the CEC line

1: BRE detection generates an Error-Bit on the CEC line (if BRESTP is set)

*Note: If BRDNOGEN=0, an Error-bit is generated upon BRE detection with BRESTP=1 in broadcast even if BREGEN=0*

Bit 4 **BRESTP**: Rx-Stop on Bit Rising Error

The BRESTP bit is set and cleared by software.

0: BRE detection does not stop reception of the CEC message. Data bit is sampled at 1.05 ms.

1: BRE detection stops message reception

Bit 3 **RXTOL:** Rx-Tolerance

The RXTOL bit is set and cleared by software.

0: Standard tolerance margin:

- Start-Bit, +/- 200 µs rise, +/- 200 µs fall.
- Data-Bit: +/- 200 µs rise. +/- 350 µs fall.

1: Extended Tolerance

- Start-Bit: +/- 400 µs rise, +/- 400 µs fall
- Data-Bit: +/-300 µs rise, +/- 500 µs fall

Bits 2:0 **SFT[2:0]**: Signal Free Time

SFT bits are set by software. In the SFT=0x0 configuration the number of nominal data bit periods waited before transmission is ruled by hardware according to the transmission history. In all the other configurations the SFT number is determined by software.

- 0x0
  - 2.5 Data-Bit periods if CEC is the last bus initiator with unsuccessful transmission (ARBLST=1, TXERR=1, TXUDR=1 or TXACKE= 1)
  - 4 Data-Bit periods if CEC is the new bus initiator
  - 6 Data-Bit periods if CEC is the last bus initiator with successful transmission (TXEOM=1)
- 0x1: 0.5 nominal data bit periods
- 0x2: 1.5 nominal data bit periods
- 0x3: 2.5 nominal data bit periods
- 0x4: 3.5 nominal data bit periods
- 0x5: 4.5 nominal data bit periods
- 0x6: 5.5 nominal data bit periods
- 0x7: 6.5 nominal data bit periods

### 63.7.3 CEC Tx data register (CEC_TXDR)

Address offset: 0x8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | w | w | w | w | w | w | w | w |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TXD[7:0]**: Tx data

TXD is a write-only register containing the data byte to be transmitted.

### 63.7.4 CEC Rx data register (CEC_RXDR)

Address offset: 0xC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **RXD[7:0]**: Rx data

RXD is read-only and contains the last data byte which has been received from the CEC line.

### 63.7.5 CEC Interrupt and Status Register (CEC_ISR)

Address offset: 0x10

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **TXACKE:** Tx-Missing Acknowledge Error

In transmission mode, TXACKE is set by hardware to inform application that no acknowledge was received. In case of broadcast transmission, TXACKE informs application that a negative acknowledge was received. TXACKE aborts message transmission and clears TXSOM and TXEOM controls.

TXACKE is cleared by software write at 1.

Bit 11 **TXERR:** Tx-Error

In transmission mode, TXERR is set by hardware if the CEC initiator detects low impedance on the CEC line while it is released. TXERR aborts message transmission and clears TXSOM and TXEOM controls.

TXERR is cleared by software write at 1.

Bit 10 **TXUDR:** Tx-Buffer Underrun

In transmission mode, TXUDR is set by hardware if application was not in time to load TXDR before of next byte transmission. TXUDR aborts message transmission and clears TXSOM and TXEOM control bits.

TXUDR is cleared by software write at 1

Bit 9 **TXEND:** End of Transmission

TXEND is set by hardware to inform application that the last byte of the CEC message has been successfully transmitted. TXEND clears the TXSOM and TXEOM control bits.

TXEND is cleared by software write at 1.

Bit 8 **TXBR:** Tx-Byte Request

TXBR is set by hardware to inform application that the next transmission data has to be written to TXDR. TXBR is set when the 4th bit of currently transmitted byte is sent. Application must write the next byte to TXDR within 6 nominal data-bit periods before transmission underrun error occurs (TXUDR).

TXBR is cleared by software write at 1.

Bit 7 **ARBLST:** Arbitration Lost

ARBLST is set by hardware to inform application that CEC device is switching to reception due to arbitration lost event following the TXSOM command. ARBLST can be due either to a contending CEC device starting earlier or starting at the same time but with higher HEADER priority. After ARBLST assertion TXSOM bit keeps pending for next transmission attempt.

ARBLST is cleared by software write at 1.

Bit 6 **RXACKE:** Rx-Missing Acknowledge

In receive mode, RXACKE is set by hardware to inform application that no acknowledge was seen on the CEC line. RXACKE applies only for broadcast messages and in listen mode also for not directly addressed messages (destination address not enabled in OAR). RXACKE aborts message reception.

RXACKE is cleared by software write at 1.

Bit 5 **LBPE:** Rx-Long Bit Period Error

LBPE is set by hardware in case a Data-Bit waveform is detected with Long Bit Period Error. LBPE is set at the end of the maximum bit-extension tolerance allowed by RXTOL, in case falling edge is still longing. LBPE always stops reception of the CEC message. LBPE generates an Error-Bit on the CEC line if LBPEGEN=1. In case of broadcast, Error-Bit is generated even in case of LBPEGEN=0.

LBPE is cleared by software write at 1.

Bit 4 **SBPE:** Rx-Short Bit Period Error

SBPE is set by hardware in case a Data-Bit waveform is detected with Short Bit Period Error. SBPE is set at the time the anticipated falling edge occurs. SBPE generates an Error-Bit on the CEC line.

SBPE is cleared by software write at 1.

Bit 3 **BRE***:* Rx-Bit Rising Error

BRE is set by hardware in case a Data-Bit waveform is detected with Bit Rising Error. BRE is set either at the time the misplaced rising edge occurs, or at the end of the maximum BRE tolerance allowed by RXTOL, in case rising edge is still longing. BRE stops message reception if BRESTP=1. BRE generates an Error-Bit on the CEC line if BREGEN=1.

BRE is cleared by software write at 1.

Bit 2 **RXOVR***:* Rx-Overrun

RXOVR is set by hardware if RXBR is not yet cleared at the time a new byte is received on the CEC line and stored into RXD. RXOVR assertion stops message reception so that no acknowledge is sent. In case of broadcast, a negative acknowledge is sent.

RXOVR is cleared by software write at 1.

Bit 1 **RXEND***:* End Of Reception

RXEND is set by hardware to inform application that the last byte of a CEC message is received from the CEC line and stored into the RXD buffer. RXEND is set at the same time of RXBR.

RXEND is cleared by software write at 1.

Bit 0 **RXBR***:* Rx-Byte Received

The RXBR bit is set by hardware to inform application that a new byte has been received from the CEC line and stored into the RXD buffer.

RXBR is cleared by software write at 1.

## 63.7.6 CEC interrupt enable register (CEC_IER)

Address offset: 0x14

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **TXACKIE***:* Tx-Missing Acknowledge Error Interrupt Enable

The TXACKEIE bit is set and cleared by software.

0: TXACKE interrupt disabled

1: TXACKE interrupt enabled

Bit 11 **TXERRIE***:* Tx-Error Interrupt Enable

The TXERRIE bit is set and cleared by software.

0: TXERR interrupt disabled

1: TXERR interrupt enabled

Bit 10 **TXUDRIE***:* Tx-Underrun Interrupt Enable

The TXUDRIE bit is set and cleared by software.

0: TXUDR interrupt disabled

1: TXUDR interrupt enabled

Bit 9 **TXENDIE***:* Tx-End Of Message Interrupt Enable
The TXENDIE bit is set and cleared by software.
0: TXEND interrupt disabled
1: TXEND interrupt enabled

Bit 8 **TXBRIE***:* Tx-Byte Request Interrupt Enable
The TXBRIE bit is set and cleared by software.
0: TXBR interrupt disabled
1: TXBR interrupt enabled

Bit 7 **ARBLSTIE***:* Arbitration Lost Interrupt Enable
The ARBLSTIE bit is set and cleared by software.
0: ARBLST interrupt disabled
1: ARBLST interrupt enabled

Bit 6 **RXACKIE***:* Rx-Missing Acknowledge Error Interrupt Enable
The RXACKIE bit is set and cleared by software.
0: RXACKE interrupt disabled
1: RXACKE interrupt enabled

Bit 5 **LBPEIE***:* Long Bit Period Error Interrupt Enable
The LBPEIE bit is set and cleared by software.
0: LBPE interrupt disabled
1: LBPE interrupt enabled

Bit 4 **SBPEIE***:* Short Bit Period Error Interrupt Enable
The SBPEIE bit is set and cleared by software.
0: SBPE interrupt disabled
1: SBPE interrupt enabled

Bit 3 **BREIE***:* Bit Rising Error Interrupt Enable
The BREIE bit is set and cleared by software.
0: BRE interrupt disabled
1: BRE interrupt enabled

Bit 2 **RXOVRIE***:* Rx-Buffer Overrun Interrupt Enable
The RXOVRIE bit is set and cleared by software.
0: RXOVR interrupt disabled
1: RXOVR interrupt enabled

Bit 1 **RXENDIE***:* End Of Reception Interrupt Enable
The RXENDIE bit is set and cleared by software.
0: RXEND interrupt disabled
1: RXEND interrupt enabled

Bit 0 **RXBRIE***:* Rx-Byte Received Interrupt Enable
The RXBRIE bit is set and cleared by software.
0: RXBR interrupt disabled
1: RXBR interrupt enabled

**Caution:** (*) It is mandatory to write CEC_IER only when CECEN=0

### 63.7.7 HDMI-CEC register map

The following table summarizes the HDMI-CEC registers.

# 64 Ethernet (ETH): Gigabit media access control (GMAC) with DMA controller

## 64.1 Ethernet introduction

The Ethernet peripheral enables the devices to transmit and receive data over Ethernet in compliance with the IEEE 802.3-2002 standard.

The Ethernet provides a configurable, flexible peripheral to meet the needs of various applications and customers. It supports two industry standard interfaces to the external physical layer (PHY): the default media independent interface (MII) defined in the IEEE 802.3 specifications and the reduced media independent interface (RMII). It can be used in number of applications such as switches and network interface cards.

In addition to the default interfaces defined in the IEEE 802.3 specifications, the Ethernet peripheral supports several industry standard interfaces to the PHY. It is compliant with the following standards:

- IEEE 802.3-2008 for Ethernet MAC, Gigabit Media Independent Interface (GMII), Media Independent Interface (MII)
- IEEE 1588-2008 for precision networked clock synchronization (PTP)
- IEEE 802.1AS-2011 and 802.1-Qav-2009 for Audio Video (AV) traffic
- IEEE 802.3az-2010 for Energy Efficient Ethernet (EEE)
- AMBA 2.0 for AHB slave port
- AMBA4 for AXI master port
- RGMII specification version 2.6 from HP/Marvell
- RMII specification version 1.2 from RMII consortium

## 64.2 Ethernet main features

Ethernet peripheral embeds a dedicated DMA for direct memory interface, a media access controller (MAC) and a PHY interface block supporting several formats.

### 64.2.1 MAC core features

#### Interfaces

- Separate transmission, reception, and control interfaces to the application
- 64-bit data transfer interface on the application side
- 10, 100, and 1000 Mbps data transfer rates with the following PHY interfaces:
  - IEEE 802.3-compliant GMII/MII (default) interface to communicate with an external Gigabit or Fast Ethernet PHY
  - RGMII interface to communicate with an external Gigabit PHY
  - RMII interface to communicate with an external Fast Ethernet PHY
- MDIO (Clause 22 and Clause 45) master interface for PHY device configuration and management
- Supports mandatory network statistics with RMON counters (RFC2819/RFC2665)

### Main operations

- Support of both full-duplex and half-duplex operations:
  - CSMA/CD protocol for half-duplex operation
  - IEEE 802.3x flow control for full-duplex operation
  - Optional forwarding of received pause control frames to the user application in full-duplex operation
  - Back-pressure in half-duplex operation
  - Packet bursting and packet extension in 1000 Mbps half-duplex operation
  - Automatic transmission of zero-quanta pause frame on deassertion of flow control input in full-duplex operation
- Full-duplex flow control operations (IEEE 802.3x Pause packets and Priority flow control)
- Preamble and start-of-frame data (SFD) insertion in Transmit mode, and deletion in Receive paths
- Automatic CRC and pad generation controllable on a per-frame basis
- Programmable packet length to support Standard or up to 16 Kbyte Jumbo Ethernet packets
- Programmable Inter Packet Gap
- Layer 3/Layer 4 checksum offload for received packets
- Calculation and insertion of IPv4 header checksum and TCP, UDP, or ICMP checksum in frames transmitted in Store-and-Forward mode
- Two sets of FIFOs: a 4096-byte Transmit FIFO with programmable threshold capability, and a 4096-byte Receive FIFO with a configurable threshold
- Store-and-Forward mechanism or threshold mode (cut-through) for transmission to the MAC
- Programmable Rx queue threshold (or cut-through) mode
- Internal loopback from Tx to Rx on the GMII or MII for debugging.

### VLAN management

- Source Address field insertion or replacement, as well as VLAN insertion, replacement, and deletion in transmitted packets with per-packet or static-global control
- Insertion, replacement or deletion of up to two VLAN tags
- IEEE 802.1Q VLAN tag detection and possibility to delete the VLAN tags in received packets
- Stripping of up to two VLAN tags and providing the tags in the status.

### Packet filtering

- Flexible address filtering modes:
  - 3 additional 48-bit perfect destination address (DA) filters with masks for each byte
  - 3 additional 48-bit source address (SA) comparison check with masks for each byte
  - 64 bit Hash filter for multicast and unicast (DA) addresses
  - Option to pass all multicast addressed packets
  - Promiscuous mode to pass all packets without any filtering for network monitoring
  - Pass all incoming packets (as per filter) with a status report
- Additional packet filtering:
  - VLAN tag-based: perfect match and Hash-based filtering with filtering based either on the outer or inner VLAN tag
  - Layer 3 and Layer 4-based: TCP or UDP over IPv4 or IPv6

### IEEE 1588-2008/PTPv2

- Ethernet packet time-stamping as described in IEEE 1588-2002 and IEEE 1588-2008 specifications (64-bit timestamps given in the Tx or Rx status of PTP packet). Both one-step and two-step timestamping is supported in Tx direction.
- Flexibility to control the Pulse-Per-Second (PPS) output signal (ptp_pps_o)

### Audio video (AV)

- Separate channels or queues for AV data transfer in 100 Mbps and 1000 Mbps modes
- Two queues on the receive paths for AV traffic and two queues on the Transmit path for AV traffic
- Statistical counters to calculate the bandwidth served by each Transmit channel in AV mode
- Following scheduling/arbitration algorithms in configurations with multiple queues:
  - Weighted Round Robin (WRR)
  - Strict Priority (SP)
  - Weighted Strict priority (WSP)
  - IEEE 802.1-Qav specified credit-based shaper (CBS) algorithm for Transmit channels

### Low-power modes

- Standard IEEE 802.3az-2010 for Energy Efficient Ethernet in (G)MII and Reduced Gigabit Media Independent Interface (RGMII) PHYs.
- Module to detect remote wakeup packets and AMD Magic packets

### 64.2.2 DMA features

The DMA block exchanges data between the peripheral and the system memory. DMA transfers are driven by software descriptors structure. The application can use a set of registers (see *Section 64.11.2: Ethernet DMA registers*) to control the DMA operations. The DMA block supports the following features:

- 64-bit data transfers
- Separate DMA channel in the Transmit path for each queue (x2)
- Single DMA channels for both queues in Receive path
- Optimization for packet-oriented DMA transfers with packet delimiters
- Byte-aligned addressing for data buffer support
- Dual-buffer (ring) descriptor support
- Descriptor architecture allowing large blocks of data transfer with minimum CPU intervention (each descriptor can transfer up to 32 Kbytes of data)
- Comprehensive status reporting normal operation and transfer errors
- Individual programmable burst length for Tx DMA and Rx DMA engines for optimal host bus utilization
- Programmable interrupt options for different operational conditions
- Per-packet Transmit or Receive Complete Interrupt control
- Round-robin or fixed-priority arbitration between the Receive and Transmit engines
- Start and Stop modes
- Separate ports for host control (AHB) access and host data interface (AXI)
- Tx DMA channels with TCP Segmentation Offload (TSO) feature enabled
- Time-sensitive conditional packet transmission by comparing the Slot Time information provided in the descriptor (useful for AV applications)

### 64.2.3 Bus interface features

#### AXI master interface

The AXI master interface features are the following:

- Interfaces with the application through AXI4 compatible interface
- 32-bit address width
- Little-endian mode
- AXI low-power interface
- 64-bit data
- OKAY, SLVERR, and DECERR responses
- Software-selected type of AXI burst (fixed and variable length burst) in AXI master interface; extended length fixed bursts of 32, 64, 128, and 256
- AXI 4 Kbyte boundary burst splitting and support for limiting burst to 1 Kbyte boundary
- 4+4 outstanding Read and Write transactions
- Posted writes during multiple data transfers from the AXI master interface to maximize the bus utilization
- Handshaking on AXI Read and Write data channels

### AHB slave interface

The AHB slave interface supports the following features:

- Interfaces with the application through AHB
- Little-endian mode
- AHB slave interface (32-bit) for CSR access
- All AHB burst types

The AHB slave interface does not generate the following responses:

- Split
- Retry
- Error

## 64.3 Ethernet pins and internal signals

*Table 477* lists the Ethernet inputs and output signals connected to package pins or balls, while *Table 478* shows the internal Ethernet signals.

**Table 477. Ethernet peripheral pins**

| Signal name | Alternate function name |
|---|---|
| PG5 | ETH1_GMII_CLK125/ETH1_RGMII_CLK125 |

**Table 478. Ethernet internal input/output signals**

| Signal name | Signal type | Description |
|---|---|---|
| eth_aclk | Digital input | AXI clock |
| eth_sbd_intr_it | Digital output | Main Ethernet interrupt |
| lpi_intr_o | Digital output | Sideband signal generated when the transmitter or receiver enters or exits the LPI state. |
| pmt_intr_o | Digital output | Sideband signal generated when a valid remote wakeup packet is received |
| eth_mii_tx_clk | Digital input | MII Tx kernel clock |
| eth_mii_rx_clk | Digital input | MII Rx kernel clock |
| eth_rmii_ref_clk | Digital input | RMII reference kernel clock |

## 64.4 Ethernet architecture

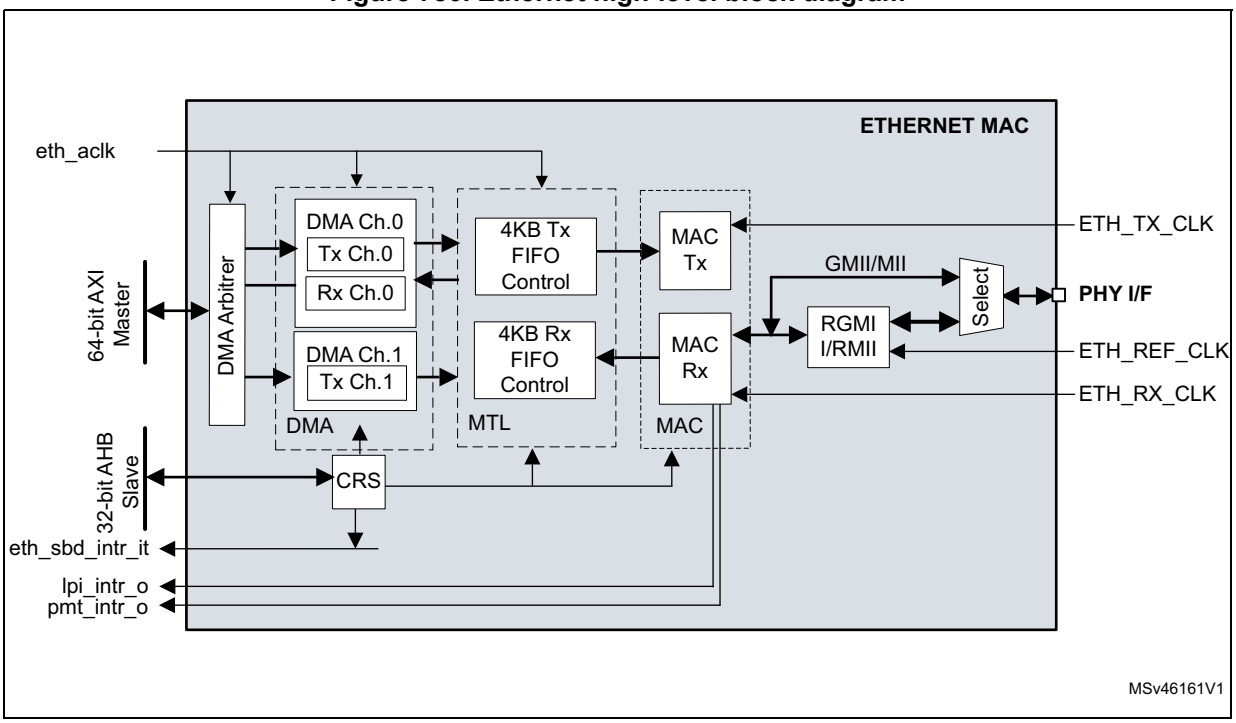
The Ethernet peripheral is composed of 4 main functional modules:

- **The control and status register module (CSR)** that controls the registers access through AHB 32-bit slave interface
- The direct memory access interface (DMA)

  This is the logical DMA module with one physical channel for reception and 2 for transmission. It controls the data transfers between MAC and system memory through the AMBA AXI4 64-bit master interface.
- **The media access control module (MAC)** in charge of implementing the Ethernet protocol
- **The mac transaction layer (MTL)** in charge of controlling the data flow between application and MAC.

A protocol adaption module is added to support the RMII or the RGMII PHY Media Independent Interfaces.

**Figure 780. Ethernet high-level block diagram**



1. For a definition of the internal signals, refer to *Table 478*.
2. Refer to RCC chapter "Clock distribution for Ethernet" for a detailed description of the Ethernet clock architecture.

### 64.4.1 DMA controller

The DMA has independent Transmit (Tx) and Receive (Rx) engines. The Tx engine transfers data from the system memory to the MAC Transaction Layer (MTL), whereas the Rx engine transfers data from the device port (PHY) to the system memory.

The controller uses descriptors to efficiently move data from source to destination with minimal application CPU intervention. The DMA is designed for packet-oriented data transfers such as packets in Ethernet. The controller can be programmed to interrupt the application CPU for situations such as Packet Transmit and Receive Transfer completion, and other normal or error conditions.

#### DMA data structures

The DMA and the application communicate through the following two data structures:

- Control and Status registers (CSR)
- Descriptor lists and data buffers

The DMA transfers the data packets received by the MAC to the Rx buffer in system memory and Tx data packets from the Tx buffer in the system memory. The descriptors that reside in the system memory contain the pointers to these buffers.

The base address of each list is written to the respective Tx and Rx registers: *Channel i Tx descriptor list address register (ETH_DMACiTXDLAR)*) and *Channel 0 Rx descriptor list address register (ETH_DMAC0RXDLAR)*).

The descriptor list is forward linked and the next descriptor is always considered at a fixed offset to the current one. The number of descriptors in the list is programmed in the respective Tx/Rx, *Channel i Tx descriptor ring length register (ETH_DMACiTXRLR)* and *Channel 0 Rx descriptor ring length register (ETH_DMAC0RXRLR)*).

Once the DMA processes the last descriptor in the list, it automatically jumps back to the descriptor in the List address register to create a descriptor ring. The descriptor lists reside in the physical memory address space of the application. Each descriptor can point to a maximum of two buffers. This enables two buffers to be used and physically addressed, rather than contiguous buffers in memory.

A data buffer resides in the application physical memory space and consists of an entire packet or part of a packet, but cannot exceed a single packet. Buffers contain only data. The buffer status is saved in the descriptor. Data chaining refers to packets that span multiple data buffers. However, a single descriptor cannot span multiple packets. The DMA skips to the data buffer of next packet when EOP is detected.

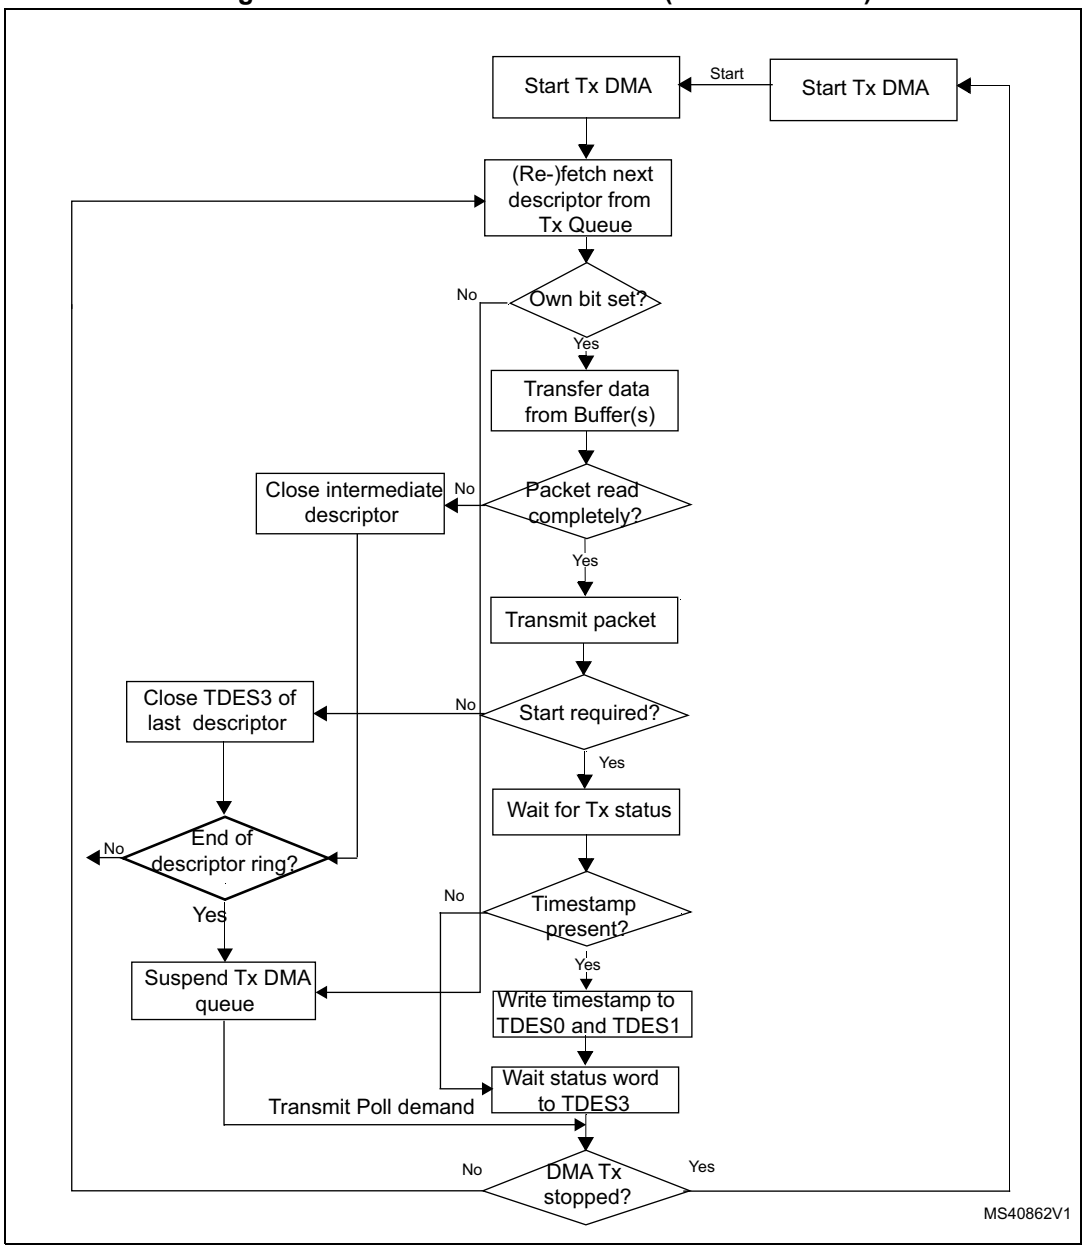
Descriptors are specified in *Section 64.10: Descriptors*.

### DMA transmission in default mode

The Tx DMA engine in default mode proceeds as follows:

1. The application sets up the Transmit descriptor (TDES0–TDES3) and sets the Own bit (TDES0[31]) after setting up the corresponding data buffer(s) with Ethernet Packet data.
2. The application shifts the Descriptor tail pointer offset value of the Transmit channel.
3. While in the Run state, the DMA runs an arbitration cycle to select the next Tx DMA channel from which the packets requiring transmission should be processed.
4. The DMA fetches the descriptor from the application memory.
5. If the DMA detects one of the following conditions, the transmission from that channel is suspended, bit 2 and 16 of the corresponding DMA channel Status register are set, and the Tx engine proceeds to step 11:
   – The descriptor is flagged as owned by the application (TDES3 [31] = 0).
   – The descriptor tail pointer is equal to the current descriptor pointer in Ring Descriptor list mode.
   – An error condition occurs.
6. If the acquired descriptor is flagged as owned by the DMA (TDES3[31] = 1), the DMA decodes the Transmit Data Buffer address from the acquired descriptor.
7. The DMA fetches the Transmit data from the system memory and transfers the data to the MTL for transmission.
8. If an Ethernet packet is stored over data buffers in multiple descriptors, the DMA closes the intermediate descriptor and fetches the next descriptor. Steps 3 through 7 are repeated until the end-of-Ethernet-packet data is transferred to the MTL.
9. When packet transmission is complete, if IEEE 1588 timestamp feature was enabled for the packet (as indicated in the Tx status), the timestamp value obtained from MTL is written to the Tx descriptor (TDES0 and TDES1) that contains the EOP buffer. The status information is written to this Tx descriptor (TDES3). The application now owns this descriptor because the Own bit is cleared during this step. If the timestamp feature is disabled for this packet, the DMA does not alter TDES0 and TDES1 contents.
10. Bit 0 of *Channel i status register (ETH_DMACiSR)*) is set after completing transmission of a packet that has Interrupt on Completion (TDES2[31]) set in its Last Descriptor. The DMA engine returns to step 3.
11. In the Suspend state, the DMA tries to acquire the descriptor again (and thereby return to step 3). A poll demand command is triggered by writing any value to the *Channel i Tx descriptor tail pointer register (ETH_DMACiTXDTPR)* when it receives a Transmit Poll demand and the Underflow Interrupt Status bit is cleared. If the application stopped the DMA by clearing Bit 0 of Transmit control register of corresponding DMA channel, the DMA enters the Stop state.

**Figure 781. DMA transmission flow (standard mode)**



## DMA transmission in OSP (Operate on Second Packet) mode

In Run state, if bit 4 is set in the *Channel i transmit control register (ETH_DMACiTXCR)*), the Transmit process can simultaneously acquire two packets without closing the Status descriptor of the first packet. While the Transmit process completes the first packet transfer, it immediately polls the Transmit descriptor list for the second packet. If the second packet is valid, the Transmit process transfers this packet before writing the status information of the first packet.

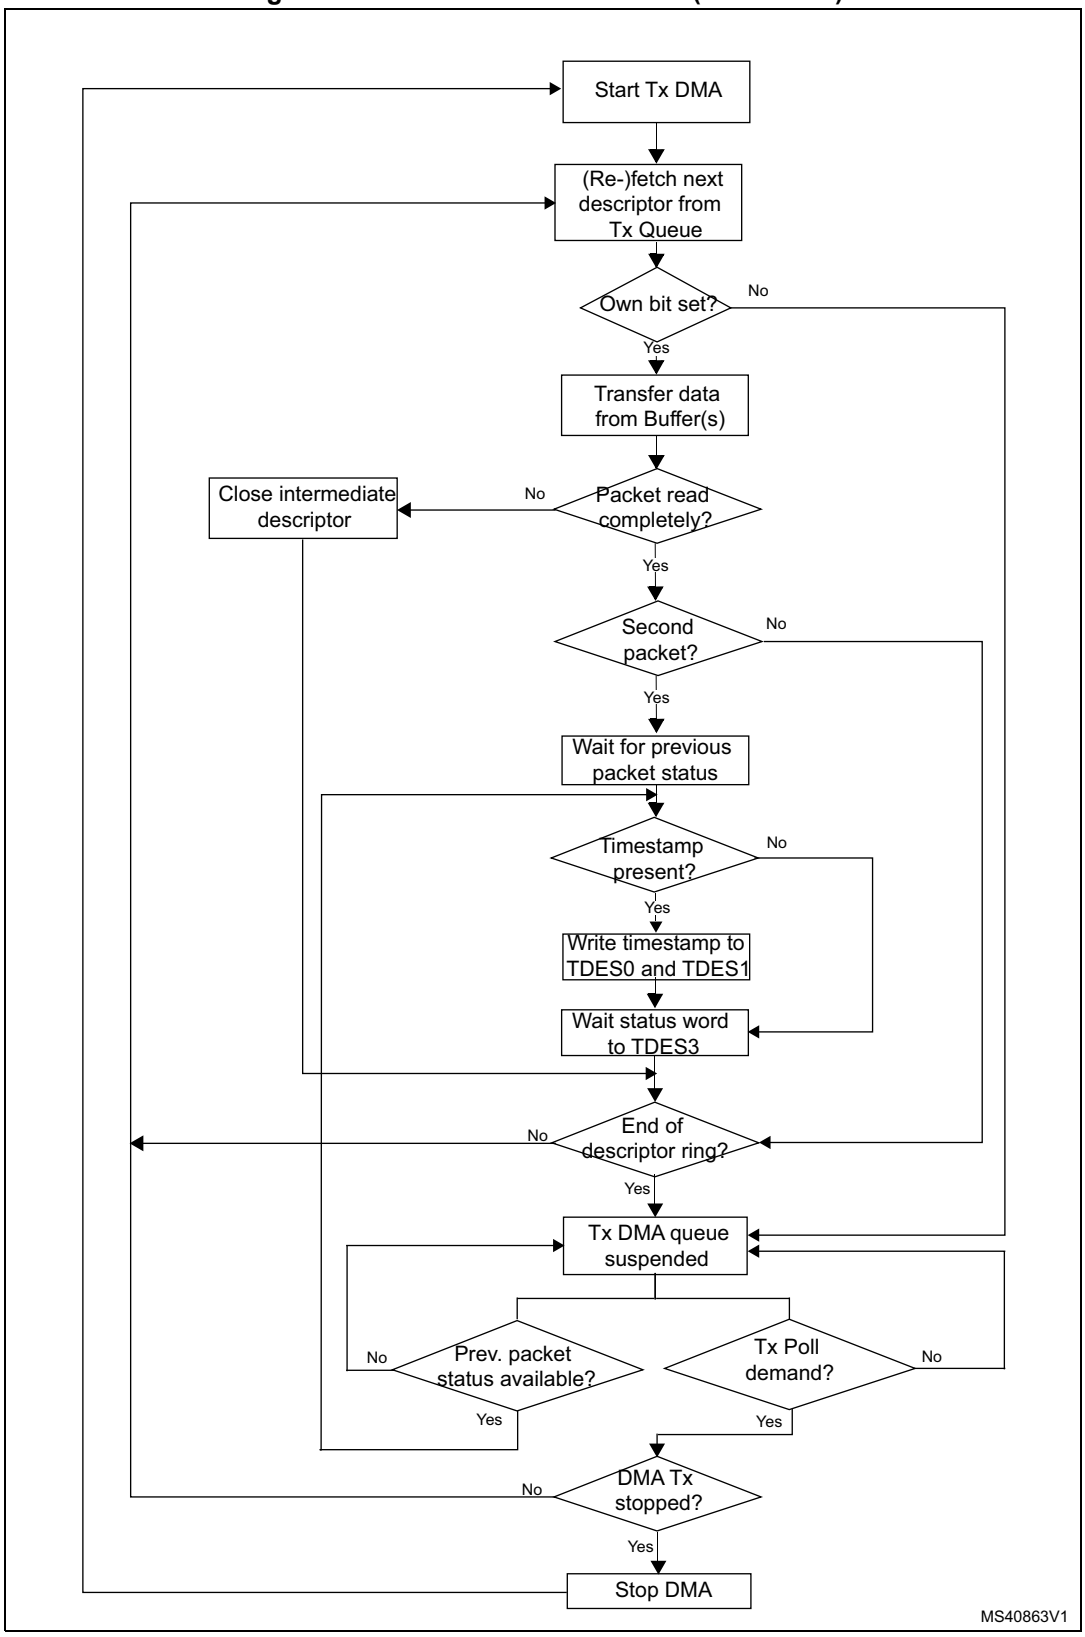
In OSP mode, DMA transmission in the Run state operates as described in the following sequence:

1. The DMA executes steps 1 to 7 of the DMA transmission sequence in default mode (see *Section : DMA transmission in default mode*).
2. The DMA fetches the next descriptor without closing previous packet last descriptor.
3. If the DMA owns the acquired descriptor, the DMA decodes the transmit buffer address in this descriptor. If the DMA does not own the descriptor, the DMA goes into Suspend mode and jumps to step 7.
4. The DMA fetches the Transmit packet from the system memory and transfers the packet to the MTL until the EOP data is transferred, closing the intermediate descriptors if this packet is split across multiple descriptors.
5. The DMA waits for the packet transmission status and timestamp of previous packet. When the status is available, the DMA writes the timestamp to TDES0 and TDES1 if such timestamp was captured (as indicated by a status bit). The DMA writes the status, with a cleared Own bit, to the corresponding TDES3, thus closing the descriptor. If Timestamp feature is not enabled for the previous packet, the DMA does not alter the contents of TDES2 and TDES3.
6. The Transmit interrupt is set (if enabled). The DMA fetches the next descriptor and proceeds to step 3 (when Status is normal). If the previous transmission status shows an underflow error, the DMA goes into Suspend mode (step 7).
7. In Suspend mode, if a pending status and timestamp are received from the MTL, the DMA performs the following operations:
   a) The DMA writes the timestamp (if enabled for the current packet) to TDES2 and TDES3.
   a) The DMA writes the status to the corresponding TDES3.
   a) The DMA sets the relevant interrupts and returns to Suspend mode.

   If no status is pending and the application stopped the DMA by clearing bit 0 of Transmit Control Register of corresponding DMA channel, the DMA enters the Stop state.
8. The DMA can exit Suspend mode and enter the Run state (it goes either to step 1 or to step 2 depending on pending status) only after receiving a Transmit Poll demand in Transmit Descriptor Tail Pointer register of corresponding channel.

A description of the basic DMA transmission flow in OSP mode in given in *Figure 783: Receive DMA flow*.

**Figure 782. DMA transmission flow (OSP mode)**



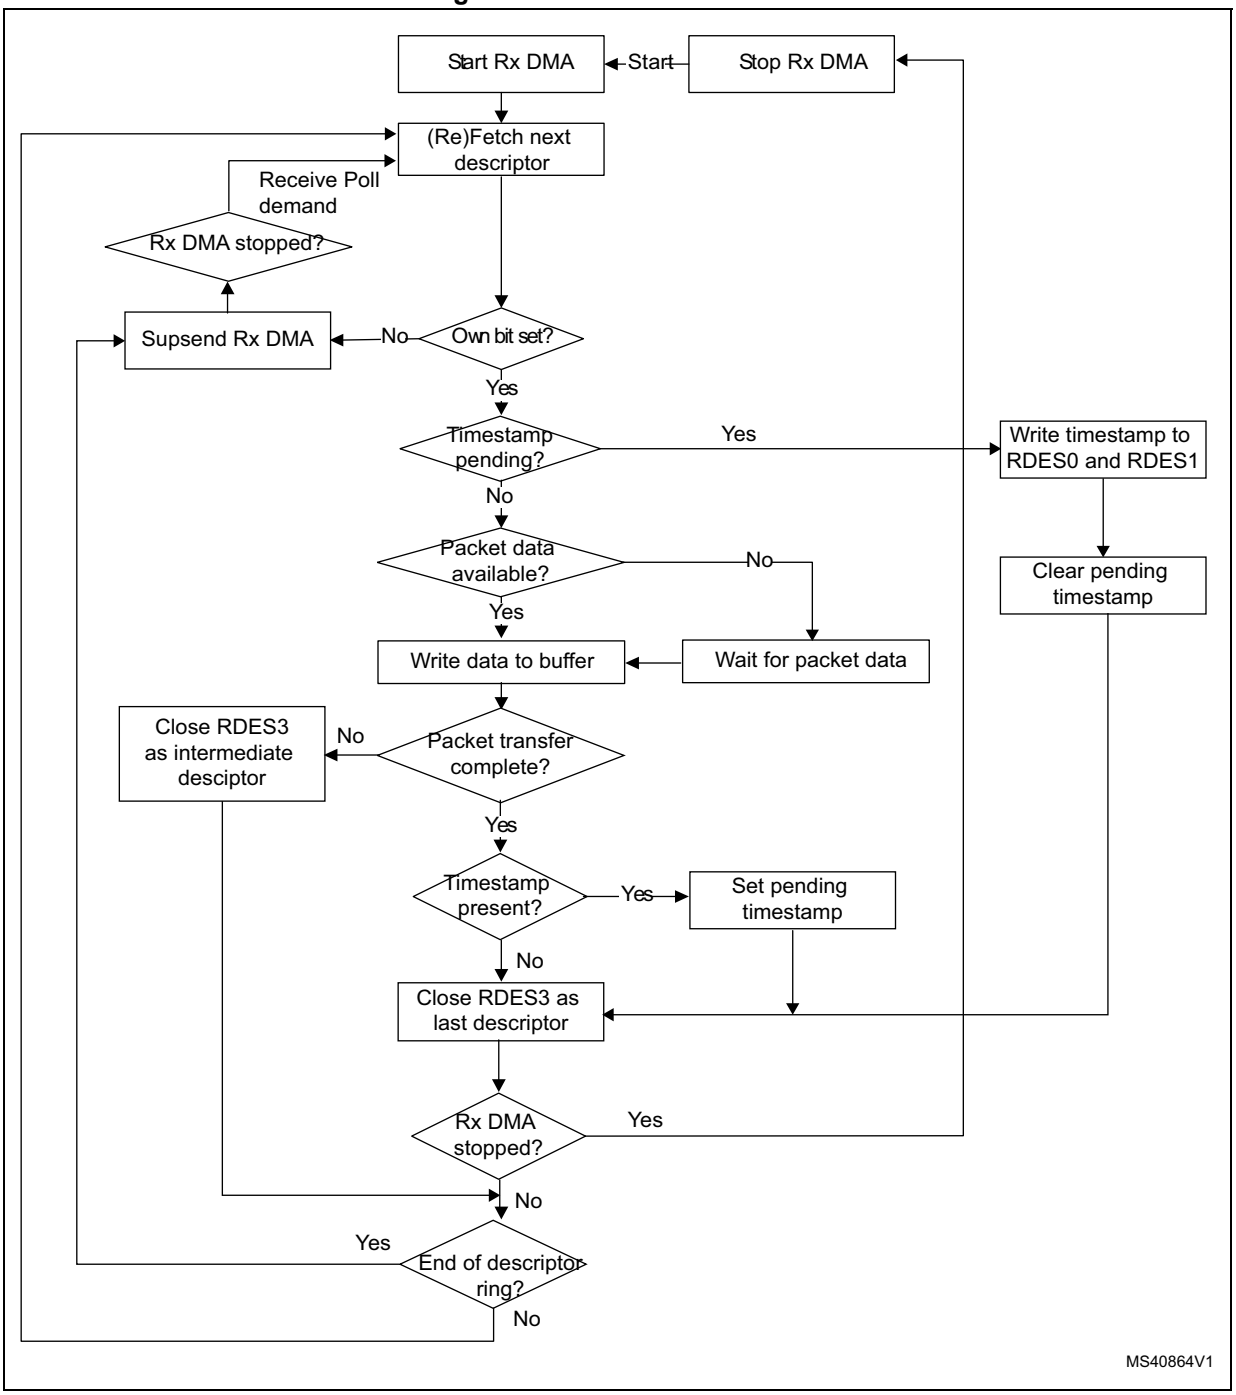
### DMA reception

In the Receive path, the DMA reads a packet from the MTL receive queue and writes it to the packet data buffers of the corresponding DMA channel.

The reception sequence for Rx DMA engine is as follows (see also *Figure 783: Receive DMA flow*):

1. The application sets up the Rx descriptors (RDES0-RDES3) and the Own bit (RDES3[31]). The application must set the correct value in the Receive descriptor tail pointer register of corresponding DMA channel.
2. When bit 0 of *Channel 0 receive control register (ETH_DMAC0RXCR)*) is set, the DMA enters the Run state. The DMA looks for free descriptors based on the Rx Current Descriptor and Descriptor tail pointer register values. If there are no free descriptors, the DMA channel enters the Suspend state and goes to step 11.
3. The DMA fetches the next available descriptor in the ring and decodes the receive data buffer address from acquired descriptors.
4. If IEEE 1588 timestamping is enabled and the timestamp is available for the previous packet, the DMA writes the timestamp (if available) to the RDES0 and RDES1 of current descriptor and sets the CTXT field (RDES3[30]).
5. The DMA processes the incoming packets and stores them in the data buffers of acquired descriptor.
6. If the current packet transfer is not complete, the DMA closes the current descriptor as intermediate and goes to step 10.
7. The DMA retrieves the status of the Receive frame from the MTL and writes the status word to current descriptor with the Own bit cleared and the Last descriptor bit set.
8. The DMA writes the Frame Length to RDES3 and the VLAN tag to RDES0. The DMA also writes the MAC control frame opcode, OAM control frame code, and extended status information (if available) to RDES1 of the last descriptor.
9. If IEEE 1588 timestamp feature is enabled, the DMA stores the timestamp (if available). The DMA writes the context descriptor after the last descriptor for the current packet (in the next available descriptor).
10. If more descriptors are available in the Rx DMA descriptor ring, go to step 3, otherwise go to the Suspend state (step 11).
11. The Receive DMA exits the Suspend state when a Receive Poll demand is given and the application increments the channel Receive tail pointer register. The engine proceeds to step 2 and fetches again the next descriptor.

**Figure 783. Receive DMA flow**



## 64.4.2 MTL

The MAC Transaction Layer (MTL) provides the FIFO memory interface to buffer and regulate the packets between the application system memory and the MAC. It also enables the data to be transferred between the application clock and MAC clock domains. The MTL layer features two 64-bit wide data paths: the Transmit path and the Receive Path.

- Transmit path

The application or internal DMA pushes the Ethernet packets read from the application or system memory into the corresponding queue in Tx FIFO. The packet is then popped out and transferred to the MAC when the queue threshold is reached (threshold mode) or complete packet is in the queue (store-and-forward mode). When EOP is transferred, the status of the transmission is taken from the MAC and transferred back to the application or internal DMA. The Tx queue size is 4096 bytes.

- Receive path

  The MTL Rx module receives the packets from the MAC and pushes them into the Rx queue. The status (fill level) of the queue is indicated to the application or to DMA when it crosses the configured Receive threshold (RTC bits[1:0] defined in the operating mode register of the corresponding queue), or when the complete packet was received. The MTL also indicates the queue fill level so that the DMA can initiate preconfigured burst transfers towards the master interface. The Rx queue size is 4096 bytes.

### 64.4.3 MAC

The MAC is responsible of the Ethernet protocol processing.In Transmission mode, it receives data from MTL before transferring it to the PHY interface. In Reception mode, the MAC receives data from the PHY interface before transferring them to the Rx FIFO of the MTL module.

This section briefly describes transmission and reception sequences.

#### MAC transmission

The transmission sequence is as follows:

1. Transmission is initiated when the MTL application pushes in data with the SOP (Start of packet) signal asserted.
2. When the SOP signal is detected, the MAC accepts the data and begins the transmission to the GMII.
3. When the EOP (End of packet) is transferred to the MAC, the MAC does one of the following:
   - The MAC completes the normal transmission and provides the transmission status to the MTL.
   - If a normal collision (in half-duplex mode) occurs during transmission, the MAC provides the Transmit status to the MTL, with the Retry bit set. The MAC provides the Retry request till one of the following is true:

     The packet was successfully transmitted

     The maximum number of Retry requests expires. In this case, the MAC aborts the packet transmission with Excessive Collision Transmit status. The MAC accepts and drops all further data until the next SOP is received. The MTL block should retransmit the same packet from SOP when a Retry request (in the Status) in observed from the MAC.
   - If any one of the following happens, the MAC aborts the packet transmission:

     No carrier (half-duplex mode)

     Loss of carrier (half-duplex mode)

     Excessive deferral (half-duplex mode)

     Late collisions (half-duplex mode)

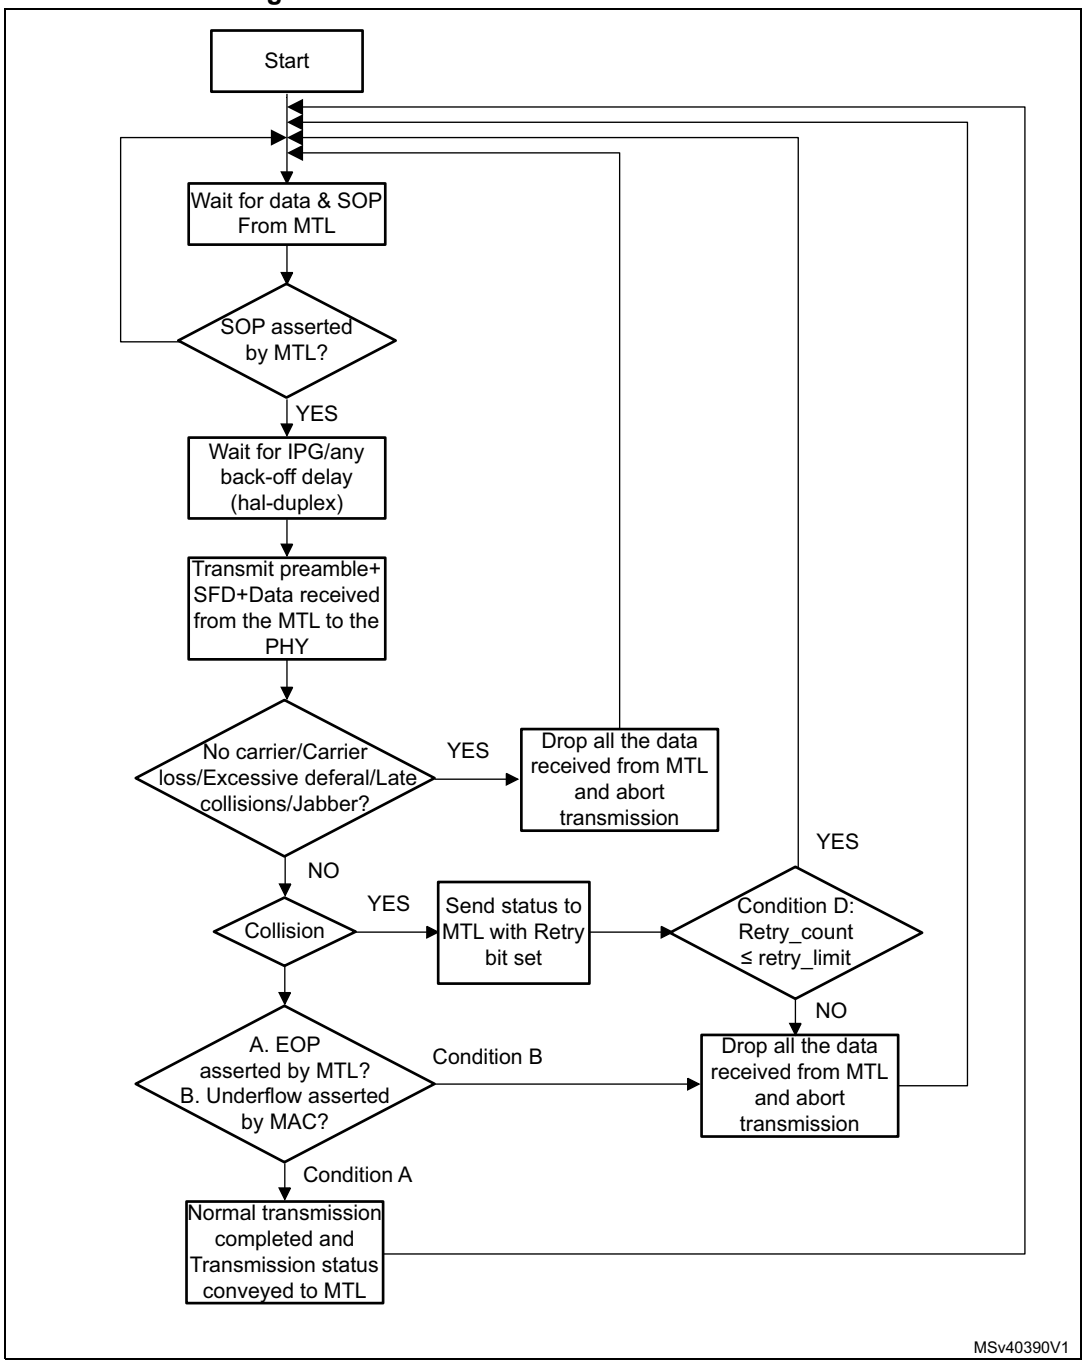
     Jabber

The MAC accepts and drops all further data until the next SOP is received.

4. The MAC issues an underflow status if the MTL is not able to provide the data continuously during the transmission. The MAC accepts and drops all further data until the next SOP is received.
5. During the normal transfer of a packet from MTL, if the MAC receives a SOP without getting an EOP for the previous packet, it ignores the SOP and considers the new packet as continuation of the previous packet.

*Figure 784: Overview of MAC transmission flow* illustrates the MAC transmission process flow.

**Figure 784. Overview of MAC transmission flow**



### MAC reception

A receive operation is initiated when the MAC detects an SFD on GMII. The MAC strips the preamble and SFD before proceeding to process the packet. The header fields are checked for filtering and the FCS field used to verify the CRC for the packet. The received packet is stored in a shallow buffer until the address filtering is performed. The packet is dropped in the MAC if it fails the address filter.

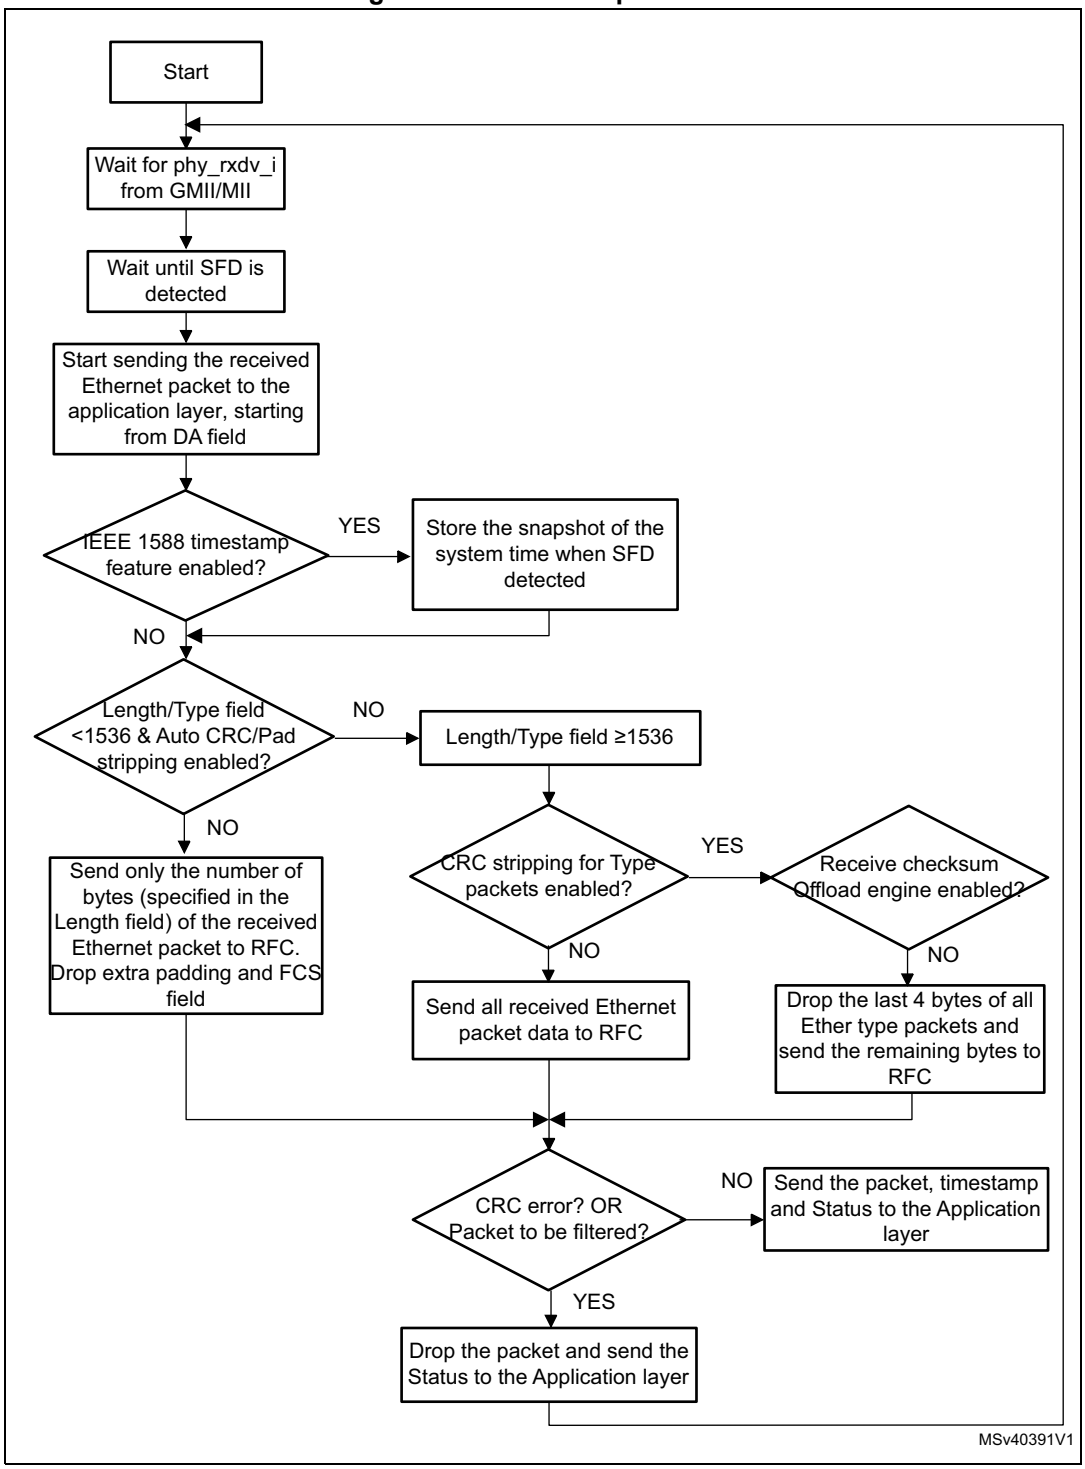
The reception sequence is as follows:

1. When the receive data valid signal (RxDV) of GMII becomes active, the Receive State Machine (RSM) starts looking for the SFD field (0x5D byte in GMII mode).

   The state machine drops received packets until it detects SFD.
2. When SFD is detected, the state machine starts sending the data of Ethernet packet to the RPC module, beginning with the first byte following the SFD (destination address).
3. If IEEE 1588 timestamp feature is enabled, the MAC takes a snapshot of the system time at which SFD of any packet is detected on GMII. If this packet is not dropped during MAC filtering, the timestamp is passed to the application.The Receive State Machine decodes the Length/Type field of the Ethernet packet being received.

   If the Length/Type field is less than 1,536 and if the MAC is programmed for the Auto CRC/Pad Stripping (bit 20 of the *Operating mode configuration register (ETH_MACCR)*), the state machine sends the packet data up to the count specified in the Length/Type field and starts dropping bytes (including the FCS field). The state machine decodes the Length/Type field and checks for the Length interpretation.
4. If the Length/Type field is greater than or equal to 1,536, the RPE module sends all received Ethernet packet data to the RFC module if you have not enabled the CRC stripping for Type packet in Bit 21 of the *Operating mode configuration register (ETH_MACCR)*. However, if the CRC stripping has been enabled for Type packets and not enabled the Receive Checksum Offload Engine, the MAC strips and drops the last 4 bytes of all packets of ether type before forwarding the packets to the application.
5. By default, the MAC is programmed for watchdog timer to be enabled, that is, packets above 2,048 (10,240 if Jumbo Packet is enabled) bytes (DA + SA + LT + DATA + PAD + FCS) are cut off at the RPE module. In addition, you can use a programmable watchdog timer (bit 16 of *Watchdog timeout register (ETH_MACWTR)*) to override the fixed timeout of 2,048 or 10,240 bytes. You can disable the watchdog timer by programming bit 19 of *Operating mode configuration register (ETH_MACCR)*. However, even if the watchdog timer is disabled, a packet greater than 32 Kbytes is cut off and a watchdog timeout status is given.

**Figure 785. MAC reception flow**



### 64.4.4 Multiple channels and queues support

This chapter describes how the Ethernet peripheral core supports multiple queues and channels. Two queues in Rx and Tx side are supported. Two DMA channels are implemented on Tx side, one channel per queue, while only one single DMA channel is implemented for the both queues on Rx path. The multiple queues allows the support of the Audio Video Bridging (AVB) protocol.

#### DMA channels

This section describes how multiple queues are supported in the Transmit and Receive paths.

**Transmit path**

The Ethernet peripheral supports two Tx channels, channel 0 and 1. The priority scheme between both channels is fixed priority. In fixed priority scheme, the channel with highest priority always wins the arbitration when it requests the bus: channel 1 has always priority over channel 0.

The fixed priority scheme does not necessarily cause lower priority channels to starve of AXI bus. The main reason being the AXI protocol capabilities and the TxDMA characteristics as explained below:

- Read command requests from a TxDMA for a burst of data transfers are driven on a separate AXI channel and their execution takes one clock cycle. The actual data transfer starts on a separate AXI channel only after the request is accepted. It takes multiple clock cycles to complete with relatively large read access latencies.
- The AXI master is free to issue subsequent requests even before the previous data transfers are complete.
- A TxDMA requests another data transfer only after the data transfer corresponding to its previous request is complete and transferred to the MTL Tx queue and space is available in Tx queue to accept the next request.
- The Ethernet peripheral can be programmed to control the maximum number of outstanding requests, requested burst sizes by DMA, and the burst sizes of each data transfer on the AXI bus.

**Receive Path**

The Ethernet peripheral supports only one channel in Rx direction.

**Priority scheme for Tx DMA and Rx DMA**

The DMA arbiter performs the arbitration between the Tx and Rx paths of DMA channel 0 to access descriptors and data buffers. The DMA arbiter supports two types of arbitration: fixed priority and weighted round-robin. The DA bit of the ETH_DMAMR register specifies the arbitration scheme (fixed or weighted round-robin) between the Tx and Rx DMA of a given channel.

If the Tx DMA and Rx DMA of a given channel is enabled, the DMA which gets the bus when the channel gets control of the bus must be specified. The priority between the corresponding Tx DMA and Rx DMA can be configured through the TXPR field of the ETH_DMAMR register. For round-robin arbitration, the weighted priority between the Tx DMA and Rx DMA is configured through the PR field of the ETH_DMAMR register. *Table 479* provides information about the priority scheme between Tx DMA and Rx DMA.

**Table 479. Priority scheme for Tx DMA and Rx DMA(1)**

| Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 1 | Priority scheme |
|---|---|---|---|---|---|
| x | x | x | 0 | 1 | Rx always has priority over Tx |
| 0 | 0 | 0 | 0 | 0 | Tx and Rx have equal priority. Rx gets the access first on simultaneous requests. |
| 0 | 0 | 1 | 0 | 0 | Rx has priority over Tx in ratio 2:1. |
| 0 | 1 | 0 | 0 | 0 | Rx has priority over Tx in ratio 3:1. |
| 0 | 1 | 1 | 0 | 0 | Rx has priority over Tx in ratio 4:1. |
| 1 | 0 | 0 | 0 | 0 | Rx has priority over Tx in ratio 5:1. |
| 1 | 0 | 1 | 0 | 0 | Rx has priority over Tx in ratio 6:1. |
| 1 | 1 | 0 | 0 | 0 | Rx has priority over Tx in ratio 7:1. |
| 1 | 1 | 1 | 0 | 0 | Rx has priority over Tx in ratio 8:1. |
| x | x | x | 1 | 1 | Tx always has priority over Rx. |
| 0 | 0 | 0 | 1 | 0 | Tx and Rx have equal priority. Tx gets the access first on simultaneous requests. |
| 0 | 0 | 1 | 1 | 0 | Tx has priority over Rx in ratio 2:1. |
| 0 | 1 | 0 | 1 | 0 | Tx has priority over Rx in ratio 3:1. |
| 0 | 1 | 1 | 1 | 0 | Tx has priority over Rx in ratio 4:1. |
| 1 | 0 | 0 | 1 | 0 | Tx has priority over Rx in ratio 5:1. |
| 1 | 0 | 1 | 1 | 0 | Tx has priority over Rx in ratio 6:1. |
| 1 | 1 | 0 | 1 | 0 | Tx has priority over Rx in ratio 7:1. |
| 1 | 1 | 1 | 1 | 0 | Tx has priority over Rx in ratio 8:1. |

1. Bits 14, 13, 12, 11, and 1 are not valid for channel1 because only one direction (Transmit) is present in this channel.

### Slot number function

When the AV feature is enabled, the slot number function can be used to schedule the data fetching from the system memory by the DMA. This feature is useful when the source AV data needs to be transmitted at specific intervals. The slot number at which the DMA should fetch the data from system memory can be programmed in the **Transmit Descriptor Word 3 (TDES3)**. This 4-bit field allows the application to schedule data fetching at up to 16 slots of 125 µs each. This field is applicable only to the AV channels.

When the DMA fetches a Tx descriptor, it compares the slot number of the Tx descriptor with the internally generated reference slot interval. The slot interval is a counter that is updated every 125 µs of the IEEE 1588 system time. In addition, the slot interval counter is initialized to zero when the seconds field of the system time is incremented, that is, when

the subsecond counter rolls over. The DMA fetches the data only if it matches the current slot or the next slot. The DMA remains in the descriptor fetch state until a match is found.

To enable the DMA to fetch data only if it matches the current slot or the next two slots, program bit 1 of the Slot Function Control and Status register (ETH_DMACiSFCSR**)** of the corresponding DMA channel.

*Note: If the slot number in the descriptor is less than the reference slot number, the DMA considers it as a future slot.*

The slot number check can be enabled by setting bit 0 in the ETH_DMACiSFCSR register of corresponding DMA channel. If this check is disabled, the packets are fetched immediately after the descriptor is read. In addition, bits [19:16] indicate the value of the reference slot number in DMA.

**Selection of the tag priorities assigned to Tx and Rx queues**

The VLAN tag priorities can be assigned to Tx queues by programming the corresponding PSTQx field in the ETH_MACTXQPMR registers.

The bit corresponding to the VLAN tag priority can be set in the PSTQx field to assign the corresponding priority to the Tx queue. As an example, to assign VLAN tag priority of 3 to Tx queue 0, set bit3 in PSTQ0 field.

The same VLAN tag priority can be set for multiple Tx queues. The Tx packet association to a given Tx queue is governed by the application. As a result the MAC does not route the packet based on Tx queue priority mapping; it is only used for Pause Flow Control (PFC). The settings in the PSTQx field determines the Tx queues blocked for transmission when the PFC packet is received with the corresponding VLAN Tag priorities enabled.

The VLAN tag priorities can be assigned to Rx queues by programming the PSRQ field in the corresponding ETH_MACRXQC2R register. The bit corresponding to the VLAN tag priority can be set in the PSRQ field to assign the corresponding priority to the Rx queue. As an example, to assign VLAN tag priority 3 to Rx queue 0, set bit3 of PSRQ field in the ETH_MACRXQC2R register. The VLAN tag priority assigned to a given Rx queue must be unique. This means that more than multiple Rx queues cannot be assigned the same VLAN tag priority. However, multiple VLAN tag priorities can be assigned to the same Rx queue.

The settings in the PSRQ field is used for VLAN tagged Rx packet routing to Rx queues as well as for PFC based Tx flow control. The received VLAN tagged Rx packet is routed to the Rx queue that matches the VLAN tag priority. In PFC-based Tx flow control, the PSRQ field corresponding to a particular Rx queue is used to enable VLAN tag priorities in the PFC packet that is transmitted when the corresponding Rx queue threshold levels are reached.

**Rx side routing from MAC to queues**

The MAC routes the Rx packets to the Rx queues based on following packet types:

- VLAN tag priority field in VLAN tagged AV data packets
- AV control packets
- VLAN tag priority field in VLAN tagged packets
- Untagged IEEE1588 PTP over Ethernet packets

The outer C-VLAN tagged AV data Rx packets can be routed following the priorities assigned to Rx queues in PSRQ field of the corresponding ETH_MACRXQC2R registers. The corresponding Rx queue is enabled for AV through RXQxEN field in ETH_MACRX-QC0R register. These packets can be:

- single VLAN tagged with C-VLAN type
- or double VLAN tagged with outer VLAN tag of C-VLAN type when the double VLAN feature is enabled (EDVLP bit set in ETH_MACVTR register) with inner C-VLAN tagged, or inner S-VLAN tagged when SVLAN processing is enabled (ESVL bit set in ETH_MACVTR).

The AV control Rx packets can be routed following the Rx queue number specified in the AVCPQ field of ETH_MACRXQC1R register. The corresponding Rx queue is enabled for AV through RXQxEN field in ETH_MACRXQC0R register. These packets can be:

- single VLAN tagged with C-VLAN type
- or double VLAN tagged with outer VLAN Tag of C-VLAN type when double VLAN feature is enabled (EDVLP bit set in ETH_MACVTR register) with inner C-VLAN tagged or inner S-VLAN tagged when SVLAN processing is enabled (ESVL bit set in ETH_MACVTR register).

The VLAN tagged Rx packets can be routed following the priorities assigned to Rx queues in PSRQ field of the corresponding ETH_MACRXQC2R registers. The corresponding Rx queue is enabled for DCB/generic through RXQxEN field in the ETH_MACRXQC0R register.

The untagged IEEE1588 PTP over Ethernet Rx packets can be routed following the Rx queue number specified in the AVPTPQ field in ETH_MACRXQC1R register. The corresponding Rx queue is enabled for AV through RXQxEN field in the ETH_MACRXQC0R register.

If the Rx packet cannot be classified in any of the defined packet type for routing, it will be routed through Rx queue 0.

**Rx side arbitration between DMA and MTL**

After completing the current packet processing, the DMA Channel controller fetches the next descriptor. When the descriptor fetching is complete, the DMA channel controller evaluates the amount of data to be transferred to the Rx buffer based on the programmed PBL and Rx buffer length, and requests the MTL to transfer the data accordingly.

After servicing the current request, the MTL Rx queue arbitration scheme selects a Rx queue based on the arbitration scheme (RAA field of the ETH_MTLOMR register) and the weights programmed in Queue i Receive Control Register (ETH_MTLRXQiCR). The arbitration is done between queues for which DMA is ready to service. After the Rx queue is selected, PBL (Programmable Burst Length) amount of data is read out from this queue and routed to the Rx DMA channel depending on the Rx channel selected.

The arbitration takes place when every PBL data transfer is completed and descriptors are ready for the processing from at least one DMA channel.

### AV feature

The Ethernet peripheral supports the AV data transfer in 100 Mbps and 1000Mbps modes. The AV feature enables transmission of time-sensitive traffic over bridged local area

networks (LANs). The following standards define various aspects of the AV feature implementation:

- IEEE 802.1Qav-2009: allows the bridges to provide time-sensitive and loss-sensitive real-time audio video data transmission (AV traffic). It specifies the priority regeneration and controlled bandwidth queue draining algorithms that are used in bridges and AV traffic sources.
- IEEE 802.1Qat-2009: allows the network resources to be reserved for specific traffic streams traversing a bridged local area network.
- IEEE 802.1AS-2011: specifies the protocol and procedures used to ensure that the synchronization requirements are met for time-sensitive applications such as audio and video across bridged and virtual-bridged LANs consisting of LAN media where the transmission delays are fixed and symmetrical. For example, IEEE 802.3 full-duplex links include the maintenance of synchronized time during normal operation followed by addition, removal, or failure of network components and network reconfiguration.

**Transmit path functions**

When the AV feature is selected, the Transmit paths of queue 0 and queue 1 are enabled by default.

The Transmit path of queue 0 supports the strict priority algorithm, and it is used for best-effort traffic. For a queue, the strict priority algorithm determines that a packet is available for transmission if the queue contains one or more packets. When the threshold mode for MTL Tx FIFO is enabled, the strict priority algorithm determines that a packet is available for transmission if the queue contains a partial packet of size equal to the programmed threshold limit.

The Transmit path of queue 1 supports traffic management by using the credit-based shaper algorithm. For a queue, the credit-based shaper algorithm determines that a queue is available for transmission if the following conditions are true:

- The queue contains one or more packets.
- The credit for the queue is positive as per the algorithm.

Each Transmit DMA has a separate descriptor chain for fetching the transmit data. The Transmit channel that gets the access to the system bus depends on the DMA arbiter.

The Transmit path has a shared FIFO (MTL layer) for each queue. The data fetched by the DMA is put in the respective part of the FIFO. The MTL Tx Queue Scheduler controls which part of the FIFO data is transmitted by the MAC. If the credit-based shaper algorithm is enabled for queue 1, the queue is selected if the packet is available in the channel and has a positive or zero credit.

If the credit-based shaper algorithm is disabled for queue 1, the packet to be transmitted is selected based on the fixed priority scheme.

**Receive path functions**

To differentiate between the AV and non-AV traffic, the MAC provides a status that indicates if the received packet is an AV packet as well as the corresponding VLAN Priority tag value. This status is updated in the Extended Status field of the Receive descriptor as explained in

*Section 64.10.4: Receive descriptor*. All received packets with an EtherType field of 0x22F0 are detected as AV packets. The AV packets can be of the following two types:

- AV data packets

  AV data packets are always tagged. Tagged AV data packets are received following the programmed priority value.
- AV control packets

  The AV control packets can be either tagged or untagged. By default, untagged AV control packets are received on queue 0. To receive these packets on queue 1, program bits[2:0] of the ETH_MACRXQC1R register. Similarly to the AV data packets, tagged AV control packets are received following the programmed priority value.

In addition to the AV packets, you can receive the untagged PTP packets on any queue. By default, the PTP packets (tagged or untagged) are received on queue 0. To receive these packets on any other queue, program bits[6:4] of the ETH_MACRXQC1R register.

**Credit-based shaper algorithm**

The Queue Scheduler uses the credit-based shaper algorithm to arbitrate the AV traffic in all queues and the legacy Ethernet traffic in queue 0. The additional queues can be programmed to use the credit-based shaper algorithm.

The following sections provide information on the credit-based shaper algorithm implementation:

- Credit value
- idleSlopeCredit and sendSlopeCredit values
- Bandwidth status

*Credit value*

The credit value is accumulated every transmit clock cycle, that is every 40 ns in 100 Mbps mode and every 8 ns in 1000 Mbps mode. The credit to be added or subtracted per cycle can be fractional depending on the required idleSlope and sendSlope values, as described in *Table 480*.

**Table 480. Example of credit value per transmit cycle**

| Mode | portTransmitRate, idleSlope, sendSlope | Credit value |
|---|---|---|
| 100 Mbps | – portTransmitRate = 100 Mbps<br>– idleSlope = 70 Mbps (assuming 70% bandwidth reserved for a higher priority traffic class)<br>– sendSlope = 30 Mbps | – credit = 2.8 bits, accumulated per cycle (40 ns) for the higher priority traffic class when best-effort packet is being transmitted.<br>– credit = 1.2 bits, drained per cycle (40 ns) when higher priority traffic class packet is being transmitted. |

The DMA stores the queue traffic in the respective part of the Tx FIFO depending on the slot number in the transmit descriptor (if enabled) or the bandwidth availability on the AMBA AHB application bus.

The credit for a queue builds up only when the packet is available, but it cannot be transmitted because the MAC is sending a packet from another queue. The Ethernet peripheral supports another mode in which the credit can build up in advance for a queue in which no packet is available in respective part of the FIFO. This enables sending a burst of high prior-

ity traffic in a queue as soon as the data is available. This mode can be enabled through bit 1 of the CBS Control registers of the corresponding queues.

- When reset, the accumulated credit parameter in the credit-based shaper algorithm is set to zero if there is positive credit, and there is no packet to transmit in a queue. The credit does not accumulate when there is no packet waiting in a queue and other queues are transmitting.
- When set, the accumulated credit parameter in the credit-based shaper algorithm is not reset to zero if there is positive credit and no packet to transmit in a queue. The credit accumulates even when there is no packet waiting in a queue and other queues are transmitting.

*idleSlopeCredit and sendSlopeCredit values*

The software must program the idleSlopeCredit and sendSlopeCredit values. The programmed values should be the credit accumulated or drained per clock cycle scaled by 1024 (such as 2.8 x 1024 = 2867 and 1.2 x 1024 = 1229). In addition, the software must program the hiCredit and loCredit values, scaled by 1024, to adjust for scaling of the idleSlopeCredit and sendSlopeCredit values. This means that if computed hiCredit and loCredit values are 12,000 bits and 3,036 bits respectively, the values to be programmed in the hiCredit and loCredit registers of the corresponding channel are 12000 x 1024 bits and two's complement of 3036 x 1024, respectively.

*Bandwidth status*

The hardware maintains the status of the actual bandwidth consumed by each higher priority queue in the CBS status registers. This enables the software to estimate the average bandwidth consumed by numerically higher traffic classes as compared to the reserved bandwidth.

The CBS status register gives the average number of bits transmitted during the previous programmed slot interval (1, 2, 4, 8, or 16 slots of 125 µs) in a queue. The status register is updated even if the credit-based shaper algorithm is not enabled for a queue. The number of slots over which the average bits transmitted per slot are computed is programmed in bits[6:4] of the CBS control register of the respective queue. For example, if you have programmed two slots, the average bits are computed over slot numbers 0–1, 2–3, 4–5, and so on.

The value programmed in the idleSlopeCredit register of a queue is proportional to the bandwidth reserved for the queue. The software can allocate any bandwidth that is not used by the higher priority queue to the reserved bandwidth of the lower priority queue.

A lower priority queue, which is using the credit-based shaper algorithm, cannot use the unused reserved bandwidth of any higher priority queue that is using the credit-based shaper algorithm. However, a lower priority queue, which is using the strict-priority algorithm, can use the unused reserved bandwidth of any higher priority queue that uses the credit-based shaper algorithm. For example, queue 1 and queue 2 use the credit-based shaper algorithm (with reserved bandwidth of 50% and 25%, respectively) and queue 0 uses the strict-priority algorithm. If queue 1 uses only 40% of reserved bandwidth, the remaining 10% is used by queue 0. Queue 2 cannot exceed the reserved bandwidth of 25%.

# 64.5 Ethernet functional description: MAC

## 64.5.1 Double VLAN processing

The Ethernet peripheral supports the double VLAN (Virtual LAN) tagging feature in which the MAC can process up to two VLAN tags (inner and outer).

The MAC supports the following:

- Insertion, replacement, or deletion of up to two VLAN tags in the Transmit path
- Packet filtering and stripping based on any one of the two VLAN Tags in the Receive path. Stripping and providing up to two VLAN Tags in the Receive path as a part of the Receive status

### Transmit path

*Table 481: Double VLAN processing features in Tx path* describes the features supported by the MAC on the Transmit side.

**Table 481. Double VLAN processing features in Tx path**

| Feature | Description |
|---|---|
| Support for C-VLAN and S-VLAN Tag types | The inner or outer VLAN tag can be of C-VLAN and S-VLAN type. The VLAN type is specified through the CSVL bit of *VLAN inclusion register (ETH_MACVIR)* and *Inner VLAN inclusion register (ETH_MACIVIR)*, respectively.<br>The Ethernet peripheral supports processing of any sequence of outer and inner VLAN tags. However, it does not support the C-VLAN S-VLAN sequence.<br>The MAC does not check whether the packet provided by the application has a valid sequence of the VLAN Tag types or the insertion or replacement operation results in invalid sequence of VLAN Tag type. Therefore, the application must provide correct sequence of VLAN Tag types and program the MAC in such a way that it results in correct sequence of VLAN Tag types in the transmitted packet. The application must ensure the following:<br>– The inner tag should not be S-VLAN when outer C-VLAN Tag insertion is enabled.<br>– The outer tag should not be C-VLAN when inner S-VLAN Tag insertion is enabled.<br>– The inner tag should not be S-VLAN when outer tag should be replaced with C-VLAN.<br>– The outer tag should not be C-VLAN when inner tag should be replaced with S-VLAN. |

**Table 481. Double VLAN processing features in Tx path (continued)**

| Feature | Description |
|---|---|
| VLAN Tag deletion | VLAN tag deletion can be enabled for outer or inner tag through VLC field in the *VLAN inclusion register (ETH_MACVIR)* or *Inner VLAN inclusion register (ETH_MACIVIR)*, respectively. When VLAN deletion is enabled, the MAC deletes the tag present at the corresponding position. When a packet has only one tag, it is considered as the outer tag. If inner tag deletion is enabled and the packet has only one tag, the MAC does not delete the tag. |
| VLAN Tag Insertion or Replacement | VLAN tag insertion or replacement can be enabled for outer or inner tag through VLC field in the *VLAN inclusion register (ETH_MACVIR)* or *Inner VLAN inclusion register (ETH_MACIVIR)*, respectively. When VLAN tag insertion or replacement is enabled, the VLTI bit in the previous register is used to determine whether the VLAN tag should be taken from the register or the Control Word. |

### Receive path

*Table 482: Double VLAN processing in Rx path* describes the features supported by the MAC on the Receive side and the corresponding bits in the *VLAN tag register (ETH_MACVTR)*.

**Table 482. Double VLAN processing in Rx path**

| Feature | Description |
|---|---|
| Outer or inner VLAN tag-based filtering | The MAC can filter packets based on the outer or inner VLAN tag through the ERIVLT bit. |
| C-VLAN or S-VLAN tag-based filtering | The MAC can filter packets based on the C-VLAN or S-VLAN type based on the ERSVLM bit. |
| Outer and Inner VLAN Tag stripping | The MAC can strip the outer and inner VLAN Tags from received frame based on the EVLS and EIVLS bits. |
| 16-bit outer and inner VLAN Tag and Type in Rx status | The MAC can provide the 16-bit outer and inner VLAN Tag and Type in the Rx status based on the EVLRXS and EIVLRXS bits, respectively. |
| Disabling or skipping checking of outer VLAN Tag type | The MAC can disable or skip checking of outer VLAN Tag type to match C-VLAN or S-VLAN based on the DOVLTC bit. |

## 64.5.2 Source Address and VLAN insertion, replacement, or deletion

### Source address insertion or replacement

The software can use the SA (source address) insertion or replacement feature to instruct the MAC to do the following for Tx packets:

- Insert the content of the MAC Address registers in the SA field
- Replace the content of the SA field with the content of the MAC Address registers

When SA insertion is enabled, the application must ensure that the packets sent to the MAC do not have the SA field. The MAC does not check whether the SA field is present in the Transmit packet and it inserts the content of MAC Address Registers in the SA field.

Similarly, when SA replacement is enabled, the application must ensure that the SA field is present in the packets sent to the MAC. The MAC replaces the six bytes following the Destination Address field in the Transmit packet with the content of the MAC Address Registers.

SA insertion or replacement feature can be enabled for all Transmit packets or selective packets:

- Enabling SA insertion or replacement for all packets

  To enable this feature for all packets, program the SARC field of the *Operating mode configuration register (ETH_MACCR)*.
- Enabling SA insertion or replacement for selective packets

  To enable this feature for selective packets, use the following program the SA Insertion Control field (bits[25:23] of Transmit Descriptor Word 3/TDES3, refer to *Section 64.10.3: Transmit descriptor*) in the first Transmit descriptor of the packet. When Bit 25 of TDES3 is set, the SA Insertion Control field indicates insertion or replacement by MAC Address1 registers. When bit 25 of TDES3 is reset, it indicates insertion or replacement by MAC Address 0 registers.

If MAC Address1 registers are not enabled, the MAC Address0 registers are used for insertion or replacement whatever of the value of the most-significant bit of the SA Insertion Control field.

### VLAN insertion, replacement, or deletion

The software can use the VLAN insertion, replacement, or deletion feature to instruct the MAC to do the following for Tx packets:

- Delete the VLAN Type and VLAN Tag fields
- Insert or replace the VLAN Type and VLAN Tag fields

  Insertion or replacement is performed based on the setting of VLTI bit in the *VLAN inclusion register (ETH_MACVIR)* as described in *Table 483: VLAN insertion or replacement based on VLTI bit*.

**Table 483. VLAN insertion or replacement based on VLTI bit**

| Condition | Description |
|---|---|
| VLTI bit is set | The MAC inserts or replaces the following:<br>VLAN Type field (C-VLAN or S-VLAN as indicated by the CSVL bit of *VLAN inclusion register (ETH_MACVIR)*)<br>VLAN Tag field with VT field of Transmit context descriptor of the packet |
| VLTI bit is reset | The MAC inserts or replaces the following:<br>VLAN Type field (C-VLAN or S-VLAN as indicated by the CSVL bit of *VLAN inclusion register (ETH_MACVIR)*)<br>VLAN Tag field with the VLT field of *VLAN inclusion register (ETH_MACVIR)* |

When VLAN replacement or deletion is enabled, the MAC checks if the VLAN Type field (0x8100 or 0x88A8) is present after the DA and SA fields in the Transmit packet. The replace or delete operation does not occur if the VLAN Type field is not detected in two bytes following the DA and SA fields. However, when VLAN insertion is enabled, the MAC does not check the presence of VLAN Type field in the Transmit packet and just inserts the VLAN Type and VLAN Tag fields.

You can enable the VLAN insertion, replacement, or deletion feature for all Tx packets or selective packets:

- To enable this feature for all packets, program the VLC and VLP fields of *VLAN inclusion register (ETH_MACVIR)*.
- To enable this feature for selective packets, program the VTIR field of TDES2 Normal Descriptor (see *Table 503: TDES2 normal descriptor (read format)*).

  In addition, the VLP (VLAN Priority control) bit must be reset in *VLAN inclusion register (ETH_MACVIR)* (for outer VLAN) and *Inner VLAN inclusion register (ETH_MACIVIR)* (in inner VLAN) for the MAC to take the control inputs from the host, depending on the configuration.

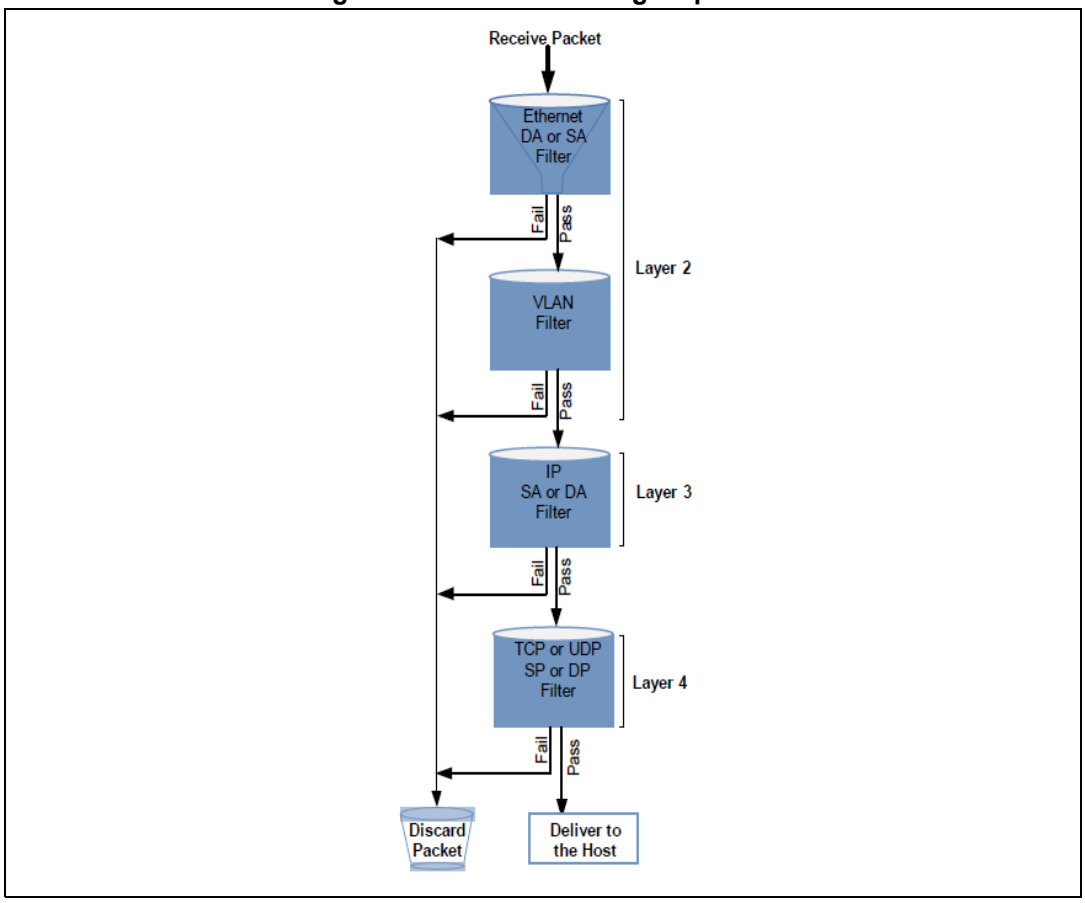
### 64.5.3 Packet filtering

The MAC supports the following types of filtering for Rx packets:

- *MAC source or destination address filtering*: the Address Filtering Module (AFM) checks the source address and destination address fields of each incoming packet.
- *VLAN filtering*: the MAC supports the VLAN tag-based and VLAN Hash filtering.
- *Layer 3 and Layer 4 filtering*: Layer 3 filtering refers to IP source address and destination address filtering. Layer 4 filtering refers to source port and destination port filtering.

The three filter types can be cascaded. *Figure 786* shows the filtering sequence for Rx packets.

**Figure 786. Packet filtering sequence**



## MAC source or destination address filtering

The MAC address filtering module checks the source address (SA) and destination address (DA) fields of each incoming packet.

### Unicast destination address filtering

The MAC supports 4 MAC addresses for unicast perfect filtering. If perfect filtering is selected (HUC bit of *Packet filtering control register (ETH_MACPFR)* is reset), the MAC compares all 48 bits of received unicast address with the programmed MAC address for any match. The default MacAddr0 is always enabled.

The MacAddr1 to MacAddr3 addresses are selected with an individual enable bit. You can mask each byte during comparison with corresponding received DA byte by setting the corresponding Mask Byte Control bit in the register. This enables group address filtering for the DA.

In Hash filtering mode (when HUC bit is set), the MAC performs imperfect filtering for unicast addresses using a 64-bit Hash table. For Hash filtering, the MAC uses the upper 6 bits CRC of the received destination address to index the content of the Hash table. A value of 00000 selects bit 0 of selected register, and a value of 11111 selects bit 63 of Hash Table register. If the corresponding bit (indicated by the 6-bit CRC) is set to 1, the unicast packet is considered to have passed the Hash filter; otherwise, the packet is considered to have failed the Hash filter.

#### Multicast destination address filtering

To program the MAC to pass all multicast packets, set the PM bit in *Packet filtering control register (ETH_MACPFR)*. If the PM bit is reset, the MAC performs the filtering for multicast addresses based on the HMC bit of the *Packet filtering control register (ETH_MACPFR)*.

In Perfect filtering mode, the multicast address is compared with the programmed MAC Destination Address registers (1–31). Group address filtering is also supported.

In Hash filtering mode, the MAC performs imperfect filtering using a 64-bit Hash table. The MAC uses the upper 6-bits CRC of received multicast address to index the content of the Hash table. A value of 000000 selects bit 0 of selected register and a value of 111111 selects bit 63 of the Hash Table register. If the corresponding bit is set to 1, the multicast packet is considered to have passed the Hash filter. Otherwise, the packet is considered to have failed the Hash filter.

#### Hash or Perfect address filtering

To configure the DA filter to pass a packet when its DA matches either the Hash filter or the Perfect filter, set the HPF bit and the corresponding HUC or HMC bits in *Packet filtering control register (ETH_MACPFR)*. This is applicable to both unicast and multicast packets. If the HPF bit is reset, only one of the filters (Hash or Perfect) is applied to receive packet.

#### Broadcast address filtering

The MAC does not filter any broadcast packets by default. To program the MAC to reject all broadcast packets, set the DBF bit in *Packet filtering control register (ETH_MACPFR)*.

#### Unicast source address filtering

The MAC can perform perfect filtering based on the source address field of received packets. By default, the MAC compares the SA field with the values programmed in the SA registers. You can configure the MAC Address registers to use SA instead of DA for comparison by setting bit 30 of corresponding register.

The MAC also supports group filtering with SA. You can filter a group of addresses by masking one or more bytes of the address. The MAC drops the packets that fail the SA filter if the SAF bit is set in *Packet filtering control register (ETH_MACPFR)*. Otherwise, the result of the SA filter is given as a status bit in the Receive Status word (see *Table 485*). When the SAF bit is set, the SA filter and DA filter result is ANDed to decide whether the packet needs to be forwarded. This means that the packet is dropped if either filter fails. The packet is forwarded to the application only if the packet passes both filters in-order.

#### Inverse filtering

For DA and SA filtering, you can invert the filter-match result at the final output by setting the DAIF and SAIF bits of *Packet filtering control register (ETH_MACPFR)*. The DAIF bit is applicable for both Unicast and Multicast DA packets. The result of the unicast or multicast destination address filter is inverted in this mode. Similarly, when the SAIF bit is set, the result of unicast SA filter is reversed.

*Table 484* and *Table 485* summarize the DA and SA filtering based on the type of packets received.

**Table 484. Destination address filtering**

| Packet type | PR | HPF | HUC | DAIF | HMC | PM | DBF | DA filter operation |
|---|---|---|---|---|---|---|---|---|
| Broadcast | 1 | X | X | X | X | X | X | Pass |
| | 0 | X | X | X | X | X | 0 | Pass |
| | 0 | X | X | X | X | X | 1 | Fail |
| Unicast | 1 | X | X | X | X | X | X | Pass all packets |
| | 0 | X | 0 | 0 | X | X | X | Pass on Perfect/Group filter match |
| | 0 | X | 0 | 1 | X | X | X | Fail on Perfect/Group filter match |
| | 0 | 0 | 1 | 0 | X | X | X | Pass on Hash filter match |
| | 0 | 0 | 1 | 1 | X | X | X | Fail on Hash filter match |
| | 0 | 1 | 1 | 0 | X | X | X | Pass on Hash or Perfect/Group filter match |
| | 0 | 1 | 1 | 1 | X | X | X | Fail on Hash or Perfect/Group filter match |
| Multicast | 1 | X | X | X | X | X | X | Pass all packets |
| | X | X | X | X | X | 1 | X | Pass all packets |
| | 0 | X | X | 0 | 0 | 0 | X | Pass on Perfect/Group filter match and drop Pause packets if PCF = 0x |
| | 0 | 0 | X | 0 | 1 | 0 | X | Pass on Hash filter match and drop Pause packets if PCF = 0x |
| | 0 | 1 | X | 0 | 1 | 0 | X | Pass on Hash or Perfect/Group filter match and drop Pause packets if PCF = 0x |
| | 0 | X | X | 1 | 0 | 0 | X | Fail on Perfect/Group filter match and drop Pause packets if PCF = 0x |
| | 0 | 0 | X | 1 | 1 | 0 | X | Fail on Hash filter match and drop Pause packets if PCF = 0x |
| | 0 | 1 | X | 1 | 1 | 0 | X | Fail on Hash or Perfect/Group filter match and drop Pause packets if PCF = 0x |

**Table 485. Source address filtering**

| Packet type | PR | SAIF | SAF | SA Filter Operation |
|---|---|---|---|---|
| Unicast | 1 | X | X | Pass all packets. |
| | 0 | 0 | 0 | Pass status on Perfect or Group filter match but do not drop packets that fail |
| | 0 | 1 | 0 | Fail status on Perfect or Group filter match but do not drop packet |
| | 0 | 0 | 1 | Pass on Perfect or Group filter match and drop packets that fail |
| | 0 | 1 | 1 | Fail on Perfect or Group filter match and drop packets that fail |

### VLAN filtering

The MAC supports Perfect and Hash VLAN filtering. Refer to *Section 64.9.13: Programming guidelines to perform VLAN filtering on the receive* for detailed programming steps.

#### VLAN tag Perfect filtering

In VLAN tag Perfect filtering, the MAC compares the VLAN tag of received packet and provides the VLAN packet status to the application. Based on the programmed mode, the MAC compares the lower 12 bits or all 16 bits of received VLAN tag to determine the perfect match.

If VLAN tag Perfect filtering is enabled, the MAC forwards the VLAN-tagged packets along with VLAN tag match status and drops the VLAN packets that do not match. You can also enable the inverse matching for VLAN packets by setting the VTIM bit of *VLAN tag register (ETH_MACVTR)*. In addition, you can enable matching of S-VLAN tagged packets along with the default C-VLAN tagged packets by setting the ESVL bit of ETH_MACVTR register. The VLAN packet status bit (bit 10 of RDES0) indicates the VLAN tag match status for the matched packets.

*Note: The source or destination address (if enabled) has precedence over the VLAN tag filters. This means that a packet that fails the source or destination address filter is dropped irrespective of the VLAN tag filter results. By default, the VLAN tag-based Perfect filter is available in all configurations.*

#### VLAN tag Hash filtering

The MAC provides VLAN tag Hash filtering with a 16-bit Hash table. The MAC performs the VLAN Hash matching based on the VTHM of the *VLAN tag register (ETH_MACVTR)*. If the VTHM bit is set, the most significant four bits of CRC-32 of VLAN tag are used to index the content of the VLAN Hash Table register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the VLAN tag of the packet matched and the packet should be forwarded. A value of 0 indicates that VLAN-tagged packet should be dropped.

*Note: The 16 or 12 bits of VLAN Tag are considered for CRC-32 computation based on ETV bit in ETH_MACVTR register.*

*When ETV bit is reset, most significant four bits of CRC-32 of VLAN Tag are inverted and used to index the content of VLAN Hash table register (ETH_MACVHTR).*

*When ETV bit is set, most significant four bits of CRC-32 of VLAN Tag are directly used to index the content of VLAN tag register (ETH_MACVTR).*

The MAC also supports the inverse matching for VLAN packets. In the inverse matching mode, when the VLAN tag of a packet matches the Perfect or Hash filter, the packet should be dropped. If the VLAN perfect and VLAN Hash match are enabled, a packet is considered as matched if either the VLAN Hash or the VLAN perfect filter matches. When inverse match is set, a packet is forwarded only when both perfect and Hash filters indicate mismatch.

*Table 486* shows the different possibilities for VLAN matching and the final VLAN match status. When the RA bit of *Packet filtering control register (ETH_MACPFR)* is set, all packets are received and the VLAN match status is indicated in the VF bit of *RDES2 normal descriptor (write-back format)*. When the RA bit is not set and the VTFE bit is set in *Packet filtering control register (ETH_MACPFR)*, the packet is dropped if the final VLAN match status is Fail. In *Table 486*, value *X* means that this column can have any value.

When VLAN VID is programmed to 0 in the VL field of *VLAN tag register (ETH_MACVTR)*, all VLAN-tagged packets are considered as perfect matched but the status of the VLAN Hash match depends on the VTHM and VTIM bits in ETH_MACVTR register.

**Table 486. VLAN match status(1)**

| VID | VLAN perfect filter match result | VTHM Bit | VLAN Hash filter match result | VTIM bit | Final VLAN match status |
|---|---|---|---|---|---|
| VID = 0 | Pass | 0 | X | X | Pass |
| | Pass | 1 | X | 0 | Pass |
| | Pass | 1 | Fail | 1 | Pass |
| | Pass | 1 | Pass | 1 | Fail |
| VID!= 0 | Pass | X | X | 0 | Pass |
| | Fail | 0 | X | 0 | Fail |
| | Fail | 1 | Fail | 0 | Fail |
| | Fail | 1 | Pass | 0 | Pass |
| | Fail | 0 | X | 1 | Pass |
| | Pass | X | X | 1 | Fail |
| | Fail | 1 | Pass | 1 | Fail |
| | Fail | 1 | Fail | 1 | Pass |

1. In this table, X represents any value.

### Layer 3 and Layer 4 filtering

The MAC supports Layer 3 and Layer 4 based packet filtering. The Layer 3 filtering refers to the IP Source or Destination Address filtering in the IPv4 or IPv6 packets whereas Layer 4 filtering refers to the Source or Destination Port number filtering in TCP or UDP.

The Layer 3 and Layer 4 packet filtering feature automatically enables the IPC Full Checksum Offload Engine on the Receive side. For Layer 3 or Layer 4 filtering operation, you must set the IPC bit of the *Operating mode configuration register (ETH_MACCR)* to enable the Rx Checksum Offload engine.

When Layer 3 and Layer 4 filtering is enabled, the packets are filtered in the following way:

- Matched packets

  The MAC forwards the packets that match all enabled fields to the application along with the status. The MAC gives the matched field status only if the IPC bit of *Operating mode configuration register (ETH_MACCR)* is set and one of the following conditions is true:

  – All enabled Layer 3 and Layer 4 fields match.

  – At least one of the enabled field matches and other fields are bypassed or disabled

  When multiple Layer 3 and Layer 4 filters are enabled, any filter match is considered as a match. If more than one filter matches, the MAC provides the status of the lowest filter where Filter 0 is the lowest filter and Filter 3 is the highest filter. For example, if Filter 0 and Filter 1 match, the MAC gives the status corresponding to filter 0.

  **The source or destination address and VLAN tag filters (if enabled) have precedence over Layer 3 and Layer 4 filter. This means that a packet which fails the source or destination address or VLAN tag filter is dropped irrespective of the Layer 3 and Layer 4 filter results.**

- Unmatched packets

  The MAC drops the packets that do not match any of the enabled fields. You can use the inverse match feature to block or drop a packet with specific TCP or UDP over IP fields and forward all other packets.

- Non-TCP or UDP IP Packets

  By default, all non-TCP or UDP IP packets are bypassed from the Layer 3 and Layer 4 filters. You can optionally program the MAC to drop all non-TCP or UDP over IP packets.

#### Layer 3 and Layer 4 filters register set

The MAC implements two sets of registers for Layer 3 and Layer 4 based packet filtering. In a register set, there is a control register, such as ETH_MACL3L4C0R, to control the packet filtering. In addition, there are five address registers to program the Layer 3 and Layer 4 fields to be matched, such as:

- *Layer4 address filter 0 register (ETH_MACL4A0R)*
- *Layer 3 Address 0 filter 0 register (ETH_MACL3A00R)*
- *Layer3 address 1 filter 0 register (ETH_MACL3A10R)*
- *Layer3 Address 2 filter 0 register (ETH_MACL3A20)*
- *Layer3 Address 3 filter 0 register (ETH_MACL3A30)*

The second, and independent set of registers are: ETH_MACL3L4C1R, ETH_MACL4A01R, ETH_MACL4A11R, ETH_MACL4A21R and ETH_MACL4A31R

**Layer 3 filtering**

The MAC supports perfect matching or inverse matching for IP Source Address and Destination Address. In addition, you can match the complete IP address or mask the lower bits matching, that is, compare all bits of the address except the specified lower mask bits.

For IPv6 packets filtering, you can enable the last four data registers of a register set to contain the 128-bit IP Source Address or IP Destination Address. The IP Source Address or Destination Address should be programmed in the order defined in the IPv6 specification, that is, the first byte of the IP Source Address or Destination Address in the received packet is in the higher byte of the register and the subsequent registers follow the same order.

For IPv4 packet filtering, you can enable the second and third data registers of a register set to contain the 32-bit IP Source Address and IP Destination Address. The remaining two data registers are reserved. The IP Source Address or Destination Address should be programmed in the order defined in the IPv4 specification, that is, the first byte of IP Source Address and Destination Address in the received packet in the higher byte of the respective register.

**Layer 4 filtering**

The MAC supports perfect matching or inverse matching for TCP or UDP Source and Destination Port numbers. However, you can program only one type (TCP or UDP) at a time. The first data register contains the 16-bit Source and Destination Port numbers of TCP or UDP, that is, the lower 16 bits for Source Port number and higher 16 bits for Destination Port number.

The TCP or UDP Source and Destination Port numbers should be programmed in the order defined in the TCP or UDP specification, that is, the first byte of TCP or UDP Source and Destination Port number in the received packet is in the higher byte of the register.

### 64.5.4 IEEE 1588 timestamps

The IEEE 1588 standard defines a Precision Time Protocol (PTP) which allows precise synchronization of clocks in measurement and control systems implemented with technologies such as network communication, local computing, and distributed objects. The PTP applies to systems communicating by local area networks supporting multicast messaging, including (but not limited to) Ethernet. This protocol enables heterogeneous systems that include clocks of varying inherent precision, resolution, and stability to synchronize. The protocol supports system-wide synchronization accuracy in the sub-microsecond range with minimal network and local clock computing resources.

The Ethernet peripheral supports the IEEE 1588-2002 (version 1) and IEEE 1588-2008 (version 2). The IEEE 1588-2002 supports PTP transported over UDP/IP. The IEEE 1588

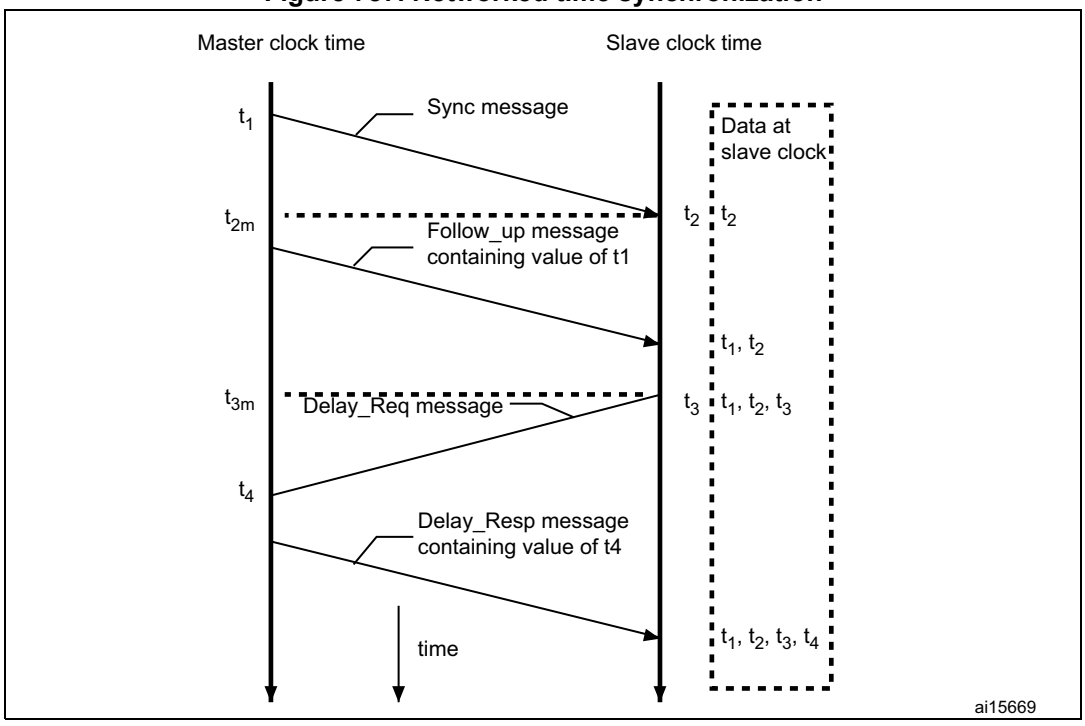
2008 supports PTP transported over Ethernet. The peripheral provides programmable support for both standards. It supports the following features:

- Support of both timestamp formats
- Optional snapshot of all packets or only PTP type packets
- Optional snapshot of only event messages
- Optional snapshot based on the clock type: ordinary, boundary, end-to-end transparent, and peer-to-peer transparent
- Optional selection of the node to act as master or slave for ordinary and boundary clock
- Identification of the PTP message type, version, and PTP payload in packets sent directly over Ethernet and sends the status
- Optional measurement sub-second time in digital or binary format

### Delay request-response mechanism

The system or network is classified into the master and slave nodes for distributing the timing and clock information. *Figure 787* shows the process that PTP uses for synchronizing a slave node to a master node by exchanging PTP messages.

**Figure 787. Networked time synchronization**



As shown in *Figure 787*, the PTP uses the following process:

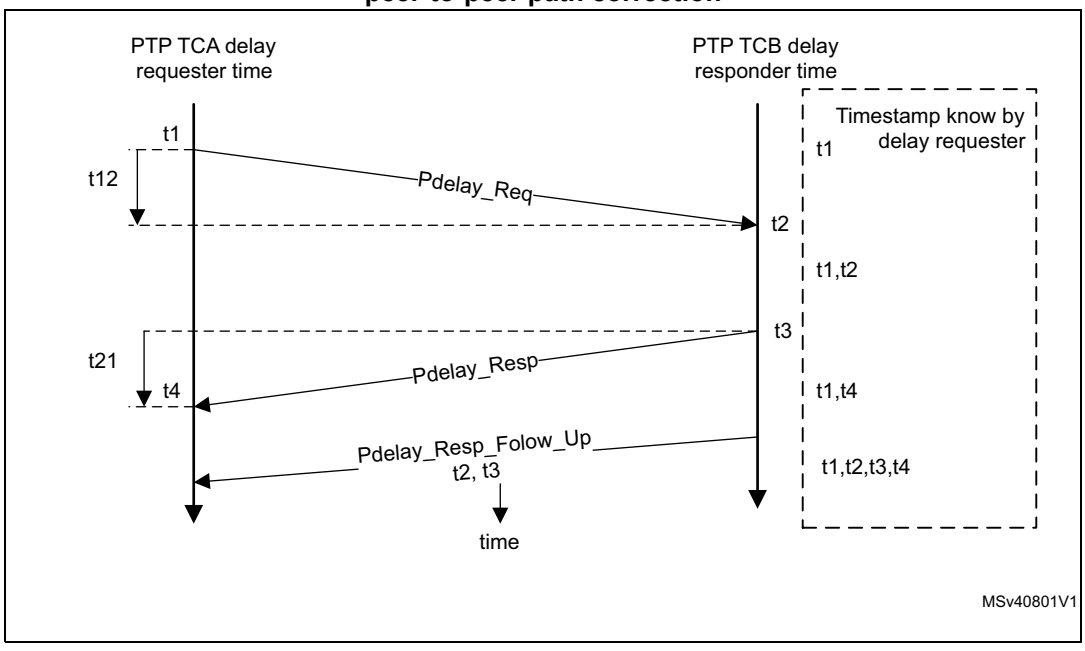
1. The master broadcasts the PTP Sync messages to all its nodes. The Sync message contains the reference time information of the master. This message leaves the system of the master at $t_1$. This time must be captured for Ethernet ports at GMII or MII.
2. The slave receives the Sync message and also captures the exact time, $t_2$, using its timing reference.
3. The master sends a Follow_up message to the slave, which contains $t_1$ information for later use.
4. The slave sends a Delay_Req message to the master and notes the exact time, $t_3$, at which this packet leaves the GMII or MII interface.
5. The master receives the message, capturing the exact time $t_4$, at which the message enters its system.
6. The master sends the $t_4$ information to the slave in the Delay_Resp message.
7. The slave uses the four values of $t_1$, $t_2$, $t_3$, and $t_4$ to synchronize its local timing reference to the timing reference of the master.

Most of the PTP implementation is done in the software above the UDP layer. However, the hardware support is required to capture the exact time when specific PTP packets enter or leave the Ethernet port at the GMII or MII interface. This timing information must be captured and returned to the software for proper implementation of PTP with high accuracy.

### Peer-to-peer PTP transparent clock (P2P TC) message support

The IEEE 1588-2008 standard supports peer-to-peer PTP (Pdelay) message in addition to the Sync, Delay Request, Follow-up, and Delay Response messages. *Figure 788* shows the method to calculate the propagation delay in clocks supporting peer-to-peer path correction.

**Figure 788. Propagation delay calculation in clocks supporting peer-to-peer path correction**



As shown in *Figure 788*, the propagation delay is calculated as follows:

1. Port 1 issues a Pdelay_Req message and generates a timestamp ($t_1$) for the Pdelay_Req message.
2. Port 2 receives the Pdelay_Req message and generates a timestamp ($t_2$) for this message.
3. Port 2 returns a Pdelay_Resp message and generates a timestamp ($t_3$) for this message.

   To minimize errors caused by frequency offset between the two ports, Port 2 returns the Pdelay_Resp message as quickly as possible after the receipt of the Pdelay_Req message. Port 2 returns any one of the following:

   – Difference between the timestamps $t_2$ and $t_3$ in the Pdelay_Resp message
   – Difference between the timestamps $t_2$ and $t_3$ in the Pdelay_Resp_Follow_Up message
   – Timestamps $t_2$ and $t_3$ in the Pdelay_Resp and Pdelay_Resp_Follow_Up messages, respectively

   Port 1 generates a timestamp ($t_4$) on receiving the Pdelay_Resp message.

   Port 1 uses all four timestamps to compute the mean link delay.

### Clock types

The MAC supports the following clock types defined in the IEEE 1588-2008 specifications:

- Ordinary clock

  The ordinary clock of a domain supports a single copy of the protocol. It has a single PTP state and a single physical port. In typical industrial automation applications, an ordinary clock is associated with an application device such as a sensor or an actuator. In telecom applications, the ordinary clock can be associated with a timing demarcation device.

  The ordinary clock can be a grandmaster or a slave clock. It supports the following features:

  – Transmission and reception of PTP messages. The timestamp snapshot can be controlled as described in *Timestamp control Register (ETH_MACTSCR)*.
  – Maintenance of the data sets such as timestamp values.

  The table below shows the messages for which you can take the timestamp snapshot on the receive side for master and slave nodes.

**Table 487. Ordinary clock: PTP messages for snapshot**

| Master | Slave |
|---|---|
| Delay_Req | SYNC |

  For an ordinary clock, you can take the snapshot of either of the following PTP message types: version 1 or version 2. You cannot take the snapshots for both PTP message types. You can take the snapshot by setting the TSVER2ENA bit and selecting the snapshot mode in *Timestamp control Register (ETH_MACTSCR)*.

- Boundary clock

  The boundary clock typically has several physical ports which communicate with the network. The messages related to synchronization, master-slave hierarchy, and signaling end in the protocol engine of the boundary clock. Such messages are not

forwarded. The PTP message type status given by the MAC helps you to identify the type of message and take appropriate action.

The boundary clock is similar to the ordinary clock except for the following features:

– The clock data sets are common to all ports of the boundary clock.

– The local clock is common to all ports of the boundary clock.

- End-to-end transparent clock

  The end-to-end transparent clock supports the end-to-end delay measurement mechanism between the slave clocks and the master clock. The end-to-end transparent clock forwards all messages like normal bridge, router, or repeater. The residence time of a PTP packet is the time taken by the PTP packet from the Ingress port to the Egress port.

  The residence time of a SYNC packet inside the end-to-end transparent clock is updated in the correction field of the associated Follow_Up PTP packet before it is transmitted. Similarly, the residence time of a Delay_Req packet, inside the end-to-end transparent clock, is updated in the correction field of the associated Delay_Resp PTP packet before it is transmitted. Therefore, the snapshot needs to be taken at both Ingress and Egress ports only for the messages mentioned in The residence time of a SYNC packet inside the end-to-end transparent clock is updated in the correction field of the associated Follow_Up PTP packet before it is transmitted. Similarly, the residence time of a Delay_Req packet, inside the end-to-end transparent clock, is updated in the correction field of the associated Delay_Resp PTP packet before it is transmitted. Therefore, the snapshot needs to be taken at both Ingress and Egress ports only for the messages mentioned in *Timestamp control Register (ETH_MACTSCR)*. You can take the snapshot by setting the SNAPTYPSEL bits to 10 in the *Timestamp control Register (ETH_MACTSCR)*. You can take the snapshot by setting the SNAPTYPSEL bits to 10 in the *Timestamp control Register (ETH_MACTSCR)*.

**Table 488. End-to-end transparent clock: PTP messages for snapshot**

| PTP Messages |
|---|
| SYNC |
| Delay_Req |

- Peer-to-peer transparent clock

  The peer-to-peer transparent clock differs from the end-to-end transparent clock in the way it corrects and handles the PTP timing messages. In all other aspects, it is identical to the end-to-end transparent clock.

  In the peer-to-peer transparent clock, the computation of the link delay is based on an exchange of Pdelay_Req, Pdelay_Resp, and Pdelay_Resp_Follow_Up messages with the link peer. The residence time of the Pdelay_Req and the associated Pdelay_Resp packets is added and inserted into the correction field of the associated Pdely_Resp_Followup packet. Therefore, support for taking snapshot for the event messages related to Pdelay is added as shown in *Timestamp control Register (ETH_MACTSCR)*.

**Table 489. Peer-to-peer transparent clock: PTP messages for snapshot**

| PTP Messages |
|---|
| SYNC |
| Pdelay_Req |
| Pdelay_Resp |

You can take the snapshot by setting the SNAPTYPESEL bit to 11 in *Timestamp control Register (ETH_MACTSCR)*.

### Reference timing source

To get a snapshot of the time, the MAC provides an internal reference time in 80-bit format as defined in the IEEE 1588-2008 specifications.

The MAC clock input is uses to generate the reference time (also called the system time) and capture timestamps. The timestamp has the following fields:

- UInteger48 secondsField
- The secondsField is the integer portion of the timestamp in units of seconds. It is 48-bits wide. For example, 2.000000001 seconds are represented as secondsField = 0x0000_0000_0002.
- UInteger32 nanosecondsField
- The nanosecondsField is the fractional portion of the timestamp in units of nanoseconds. For example, 2.000000001 nanoseconds are represented as nanoSeconds = 0x0000_0001.

  The nanosecondsField supports the following two modes:

  – **Digital rollover mode**: In this mode, the maximum value in the nanoseconds field is 0x3B9A_C9FF, that is, (10e9-1) nanoseconds.

  – **Binary rollover mode**: In this mode, the nanoseconds field rolls over and increments the seconds field after value 0x7FFF_FFFF. Accuracy is ~0.466 ns per bit.

  You can set these modes through TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)*.

The reference timing is accessible by an output pulse-per-second signal (see *Pulse-per-second output*) or by storing up to 4 snapshots in dedicated FIFO register (*Auxiliary snapshots with external events*).

#### Pulse-per-second output

The MAC supports either a fixed or a flexible pulse-per-second signal (ptp_pps_o)

- Fixed pulse-per-second output

  In this mode, only frequency of the PPS output can be changed by setting the PPSCTRL0 field in the *PPS control register [alternate] (ETH_MACPPSCR)*.

- Fixed pulse-per-second output

  In this mode, you have the flexibility to program the start or stop time, width, and interval of the pulse generated on the ptp_pps_o output.

  – The start and stop time are programmed through *PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)* registers.

  – The PPS width and interval are programmed in terms of granularity of system time (number of the units of sub-second increment value) through respective registers *PPS width register (ETH_MACPPSWR)* and *PPS interval register (ETH_MACPPSIR)*.

Refer to *Section 64.9.11: Programming guidelines for flexible pulse-per-second (PPS) output* for further details on how configuring flexible pulse output.

*Note: To ensure proper PPS signal output, it is recommended to program advanced system time for the start or stop time. If the application programs a start or stop time that has already elapsed, the MAC sets an error status bit indicating the programming error. If enabled, the MAC also sets the Target Time Reached interrupt event. The application can cancel the start or stop request only if the corresponding start or stop time has not elapsed. If the time has elapsed, the cancel command has no effect.*

**Auxiliary snapshots with external events**

The auxiliary snapshot feature allows you to store a snapshot of the system time based on an external event. The event is considered to be the rising edge of the ptp_aux_ts_trig_i sideband signal.

You can configure up to four auxiliary snapshot inputs and store up to 4 snapshots. A FIFO is accessible through registers: *Auxiliary timestamp seconds register (ETH_MACATSSR)* and *Auxiliary timestamp nanoseconds register (ETH_MACATSNR)*.

The snapshots taken for any input are stored in a common FIFO; only 64 bits are kept. The application can read the *Timestamp status register (ETH_MACTSSR)* to know the timestamp of which input is available for reading at the top of this FIFO.

When a snapshot is stored, the MAC indicates this to the application with an interrupt. The value of the snapshot is read through a FIFO register access. If the FIFO becomes full and an external trigger to take the snapshot is asserted, a snapshot trigger-missed status (ATSSTM) is set in the *Timestamp status register (ETH_MACTSSR)*. This indicates that the latest auxiliary snapshot of the timestamp is not stored in the FIFO. The latest snapshot is not written to the FIFO when it is full.

When a application reads the 64-bit timestamp from the FIFO, the space becomes available to store the next snapshot. You can clear a FIFO by setting the ATSFC bit in *Auxiliary control register (ETH_MACACR)*. When multiple snapshots are present in the FIFO, the count is indicated in Bits[27:25] of ETH_MACTSSR register.

### System time register module

The 64-bit PTP time is updated using the PTP input reference clock, HCLK. This PTP time is used as a source to take snapshots (timestamps) of the Ethernet frames being

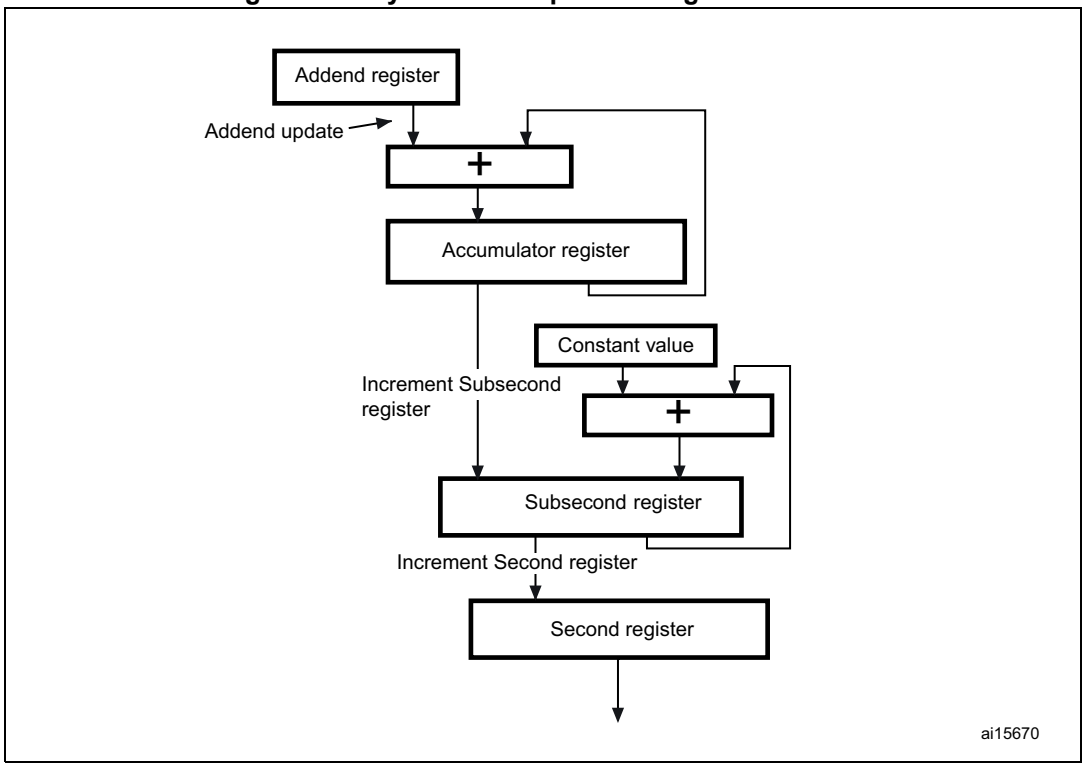
transmitted or received at the GMII. The System Time counter can be initialized or corrected using either the Coarse or the Fine correction method.

In the Coarse correction method, the initial value or the offset value is written to the Time stamp update register For initialization, the System Time counter is written with the value in the Time stamp update registers, whereas for system time correction, the offset value (Time stamp update register) is added to or subtracted from the system time.

In the Fine correction method, the slave clock (reference clock) frequency drift with respect to the master clock (as defined in IEEE 1588 specifications) is corrected over a period of time, unlike in the Coarse correction method where it is corrected in a single clock cycle. The longer correction time helps maintain linear time and does not introduce drastic changes (or a large jitter) in the reference time between PTP Sync message intervals. In this method, an accumulator sums up the contents of the Addend register as shown in *Figure 789*. The arithmetic carry that the accumulator generates is used as a pulse to increment the system time counter. The accumulator and the addend are 32-bit registers. The accumulator acts as a high-precision frequency multiplier or divider.

This system time update algorithm is shown in *Figure 789*.

**Figure 789. System time update using Fine method**



The System Time Update logic requires a 50 MHz clock frequency to achieve 20 ns accuracy. The frequency division is the ratio of the reference clock frequency to the required clock frequency. For example, if the reference clock (HCLK) is 66 MHz, this ratio is calculated as 66 MHz/50 MHz = 1.32. Therefore, the default addend value to be set in the register is $2^{32}$ / 1.32, 0xC1F07C1F.

If the reference clock drifts lower, for example, to 65 MHz, the ratio is 65 / 50, that is 1.3 and the value to set in the addend register is $2^{32}$ / 1.30, or 0xC4EC4EC4.

If the clock drifts higher, for example to 67 MHz, the addend register must be set to 0xBF0B7672. When there is not clock drift, the default addend value of 0xC1F07C1F ($2^{32}$ / 1.32) must be programmed.

In *Figure 789*, the constant value used to accumulate the sub-second register is decimal 43, which achieves a system time accuracy of 20 ns (in other words, it is incremented in 20 ns steps). When External Time Update is enabled, the optional System Time module is not available. Two different methods are used to update the System Time register depending on the configuration.

The software must calculate the drift in frequency based on the SYNC messages and accordingly update the Addend register.

Initially, the slave clock is set with FreqCompensationValue0 in the Addend register. This value is as follows:

$$\text{FreqCompensationValue}_0 = 2^{32} / \text{FreqDivisionRatio}$$

If MasterToSlaveDelay is initially assumed to be the same for consecutive Sync messages, the algorithm given in this section must be applied. After a few Sync cycles, frequency lock occurs. The slave clock can then determine a precise MasterToSlaveDelay value and re-synchronize with the master using the new value.

The algorithm is as follows:

1. At time $\text{MasterSyncTime}_n$ the master sends the slave clock a SYNC message. The slave receives this message when its local clock is $\text{SlaveClockTime}_n$ and computes $\text{MasterClockTime}_n$ as follows:

$$\text{MasterClockTime}_n = \text{MasterSyncTime}_n + \text{MasterToSlaveDelay}_n$$

2. The master clock counts for current Sync cycle, $\text{MasterClockCount}_n$ is

$$\text{MasterClockCount}_n = \text{MasterClockTime}_n - \text{MasterClockTime}_{n-1}$$

(assuming that MasterToSlaveDelay is the same for Sync cycles n and n – 1)

3. The slave clock count for current Sync cycle, $\text{SlaveClockCount}_n$ is

$$\text{SlaveClockCount}_n = \text{SlaveClockTime}_n - \text{SlaveClockTime}_{n-1}$$

4. The difference between master and slave clock counts for current Sync cycle, $\text{ClockDiffCount}_n$ is

$$\text{ClockDiffCount}_n = \text{MasterClockTime}_n - \text{SlaveClockTime}_n$$

5. The frequency-scaling factor for slave clock, $\text{FreqScaleFactor}_n$ is

$$\text{FreqScaleFactor}_n = (\text{MasterClockCount}_n + \text{ClockDiffCount}_n) / \text{SlaveClockCount}_n$$

6. The frequency compensation value for Addend register, $\text{FreqCompensationValue}_n$ is

$$\text{FreqCompensationValue}_n = \text{FreqScaleFactor}_n \times \text{FreqCompensationValue}_{n-1}$$

In theory, this algorithm achieves lock in one Sync cycle. However, it may take several cycles, because of changing network propagation delays and operating conditions. This

algorithm is self-correcting. If the slave clock is initially set to an incorrect value from the master, the algorithm corrects it at the cost of more Sync cycles.

Refer to *Section 64.9.8: Programming guidelines for IEEE 1588 timestamping* for detailed programming steps.

### Transmit path functions

The MAC captures a timestamp when the Start Packet Delimiter (SFD) of a packet is sent on the GMII or MII interface. The packets, for which you want to capture timestamps, can be controlled on per-packet basis. Each Transmit packet can be marked to indicate whether a timestamp should be captured for it.

The MAC does not process the transmitted packets to identify the PTP packets. You need to specify the packets for which you want to capture timestamps. You can specify the packets by using the control bits in Transmit Descriptor (see *Section 64.10.3: Transmit descriptor*). The MAC returns the timestamp to the software inside the corresponding Transmit descriptor, thus connecting the timestamp automatically to the specific PTP packet.

The 64-bit timestamp information is written to the TDES0 and TDES1 fields. The TDES0 field holds the 32 least significant bits of the timestamp.

### Receive path functions

The MAC can be programmed to capture the timestamp of all packets received on the GMII or MII interface or to process packets to identify the valid PTP messages. You can control the snapshot of the time to be sent to the application by using the following options of the *Timestamp control Register (ETH_MACTSCR)*:

- Enable snapshot for all packets
- Enable snapshot for IEEE 1588 version 1 or version 2 timestamp
- Enable snapshot for PTP packets transmitted directly over Ethernet or UDP-IP-Ethernet
- Enable timestamp snapshot for the received packet for IPv4 or IPv6
- Enable timestamp snapshot only for EVENT messages (SYNC, DELAY_REQ, PDELAY_REQ, or PDELAY_RESP)
- Enable the node to be a master or slave and select the snapshot type

  This feature controls the type of messages for which snapshots are taken.

The DMA returns the timestamp to the software application inside the corresponding Receive descriptor. The extended status, containing the timestamp message status and the IPC status, is written in the RDES1 normal descriptor and the snapshot of the timestamp is written in RDES0 and RDES1 fields of the context descriptor. The RDES0 field holds the 32 least significant bits of the timestamp.

### Timestamp correction

According to the IEEE 1588 specification, a timestamp must be captured when the message timestamp point (leading edge of the first bit of the octet immediately following the Start Frame Delimiter octet) crosses the boundary between the node and the network. Because the reference timing source (the PTP clock ***HCLK***) is different from the MAC Tx or Rx clock, the captured timestamp must be corrected for latency issues because of synchronization. In addition, latency issues between the internal snapshot point and the recommended capture point (the boundary between the node and the network), must also be corrected.

### Ingress correction

In the Receive side the timestamp captured at the internal snapshot point is corrected for latency and synchronization by adding the correction value (Ingress Correction Value) programmed in the Ingress Correction register. The value that needs to be programmed in the ingress correction register is calculated as follows:

1. The timestamp correction because of synchronization is compensated by adding INGRESS_SYNC_CORR to the synchronized timestamp value as follows:

   `INGRESS_SYNC_CORR = -(2*PTP_CLK_PER)`

2. The latency correction between the message timestamp point and the internal timestamp snapshot point is done by subtracting the latency value (INGRESS_LATENCY) with the captured timestamp as follows:

   `Ingress Correction = INGRESS_SYNC_CORR - INGRESS_LATENCY`

3. Ingress correction is performed by programming the TSIC field in the MAC Timestamp Ingress correction register. The ingress correction is always negative and is expressed in nanoseconds. The value is represented in complement form as follows:
   - When TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is set, the accuracy is of 1 ns: it is represented by setting bit 31 to 1 and bits 30:0 containing 10^9 - <ingress_correction_value> represented in binary. For example, if the required correction value is -5 ns, then the programmed value must be 0xBB9A_C9FB.
   - When TSCTRLSSR bit in ETH_MACTSCR register is reset, the accuracy is of ~0.466 ns: it is represented by setting bit 31 to 1 and bits 30:0 containing 2^31 - <ingress_correction_value> represented in binary.

### Egress correction

In the Transmit side the timestamp captured at the internal snapshot point is corrected for latency and synchronization by adding the correction value (Egress correction value) programmed in the Egress Correction register. The value that needs to be programmed in the egress correction register is calculated as follows:

1. The timestamp correction because of synchronization is compensated by adding EGRESS_SYNC_CORR to the synchronized timestamp value as follows:

   When Enable one step timestamp feature is selected,

   `EGRESS_SYNC_CORR = (1*PTP_CLK_PER + 4*TX_CLK_PER)`

   Otherwise,

   `EGRESS_SYNC_CORR = -(2*PTP_CLK_PER)`

2. The egress latency correction between the recommended capture point and the internal timestamp snapshot point is obtained by adding the latency value (EGRESS_LATENCY) to the captured timestamp as follows:

   `Egress Correction = EGRESS_SYNC_CORR + EGRESS_LATENCY`

3. Egress correction is performed by programming the TSEC field in the MAC Timestamp Egress correction register. The egress correction can be positive or negative. It is

expressed in nanoseconds. Negative values are represented in complement form as follows:

– When TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is set, the accuracy is of 1 ns.

  If the correction is positive, it is represented by setting bit 31 to 0 and bits 30:0 containing <egress_correction_value> represented in binary. The value must not exceed 0x 3B9A_C9FF.

  If the correction is negative, it is represented by setting bit 31 to 1 and bits 30:0 containing 10^9 - <egress_correction_value> represented in binary.

  For example, if the required correction value is -5 ns, then the programmed value should be 0xBB9A_C9FB.

– When TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is reset, the accuracy is of ~0.466 ns.

  If the correction is positive, it is represented by setting bit 31 to 0 and bits 30:0 containing <egress_correction_value> represented in binary. The maximum value is 0x7FFF_FFFF.

  If the correction is negative, it is represented by setting bit 31 to 1 and bits 30:0 containing 2^31 - <egress_correction_value> represented in binary.

### One-step timestamp

The MAC supports the one-step timestamp feature: It identifies the offset in the packet and inserts the timestamp received from the application at that offset.

You can enable the one-step timestamp feature for a packet by setting bit 20 (OSTC) in ATI Control Word. The inserted timestamp consists of the 64-bit TSSL and TSSH received from the application.

The one-step timestamp feature is supported only for the PTP over Ethernet packets. It is not supported for PTP over IPv4/IPv6 packets.

### PTP offload function

This feature enables the automatic generation of specific PTP packets to be performed, when the MAC operates as a specific node in the PTP network. These packets can be generated periodically or triggered by the host software. In other modes, this feature can parse the incoming PTP packets on the receiver, and automatically generate and respond to the required PTP packets. It helps to offload certain PTP node functions with better accuracy and lower response latency.

Depending on the programmed mode, the MAC generates PTP Ethernet messages periodically or from the application, or based on reception of a particular PTP message. *Table 490* indicates the PTP message generation criteria.

**Table 490. PTP message generation criteria**

| Programming | | | Mode | Criteria for generation of PTP messages | PTP message type generated |
|---|---|---|---|---|---|
| SNAPTYPSEL | TSMSTRENA | TSEVNTENA | | | |
| 00 | 0 | 1 | Ordinary or Boundary Slave | SYNC message reception | Delay_Req |
| 00 | 1 | 1 | Ordinary or Boundary Master | Periodic or on trigger from application | SYNC |
| | | | | Delay_Req message reception | Delay_Resp |
| 01 | 0 | 1 | Transparent Slave | Periodic or on trigger from application | Pdelay_Req |
| | | | | Pdelay_Req message reception | Pdelay_Resp |
| | | | | SYNC message reception | Delay_Req |
| 01 | 1 | 1 | Transparent Master | Periodic or on trigger from application | Pdelay_Req |
| | | | | Pdelay_Req message reception | Pdelay_Resp |
| | | | | Periodic or on trigger from application | SYNC |
| | | | | Delay_Req message reception | Delay_Resp |
| 11 | X | X | Peer-to-Peer Transparent | Periodic or on trigger from application | Pdelay_Req |
| | | | | Pdelay_Req message reception | Pdelay_Resp |
| All other programming combinations are invalid for PTP Offload feature. | | | | | |

The PTP offload feature is configured through *PTP Offload control register (ETH_MACPOCR)* register. 80 bits-PTP node identity is given in the three following registers: *PTP Source Port Identity 0 Register (ETH_MACSPI0R)*, *PTP Source port identity 1 register (ETH_MACSPI1R)* and *PTP Source port identity 2 register (ETH_MACSPI2R)*.

### 64.5.5 IPv4 ARP offload

The MAC supports the Address Recognition Protocol (ARP) Offload for IPv4 packets. This feature allows to process the IPv4 ARP request packet in the receive path and to generate the corresponding ARP response packet in the transmit path.

The MAC generates the ARP reply packets for appropriate ARP request packets**.** ARP packets for IPv4 are L2 layer packets with Length/Type of 0x0806.

The ARP offloading sequence is as follows:

1. The MAC receiver gets an ARP request if the request Target Protocol Address matches the IPv4 address programmed in the MAC L3 register.
2. The MAC generates an ARP reply packet.
3. The MAC copies the Sender Hardware Address field in the ARP request to the following fields:
   – DA field of the Ethernet packet header
   – Target Hardware Address field of the ARP reply packet
4. The MAC copies the Sender Protocol Address field in the ARP request to the Target Protocol Address field in the ARP reply packet.
5. The MAC places its MAC address in the following fields:
   – SA field of the Ethernet packet header
   – Sender Hardware Address field of the ARP reply packet
6. The MAC copies the Target Protocol Address field in the ARP request to the Sender Protocol Address field in the ARP reply packet.
7. The MAC sets the opcode field in ARP reply packet to 2 indicating ARP reply.
8. The MAC recalculates the CRC and performs padding for the generated ARP reply packet.
9. The MAC transmitter sends the ARP reply

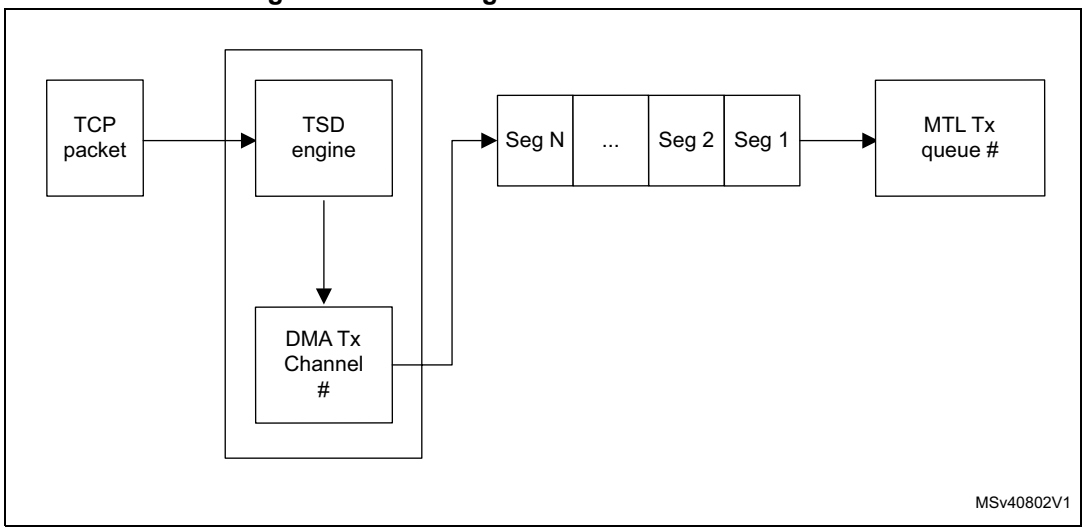
### 64.5.6 TCP segmentation offload

The MAC supports the TCP segmentation offload (TSO) feature in which the DMA splits a large TCP packet into multiple small packets and passes these packets to the MTL as shown in *Figure 790*.

This feature is enabled by programming the TSE bit of corresponding ETH_DMACiCR register (see *Channel i control register (ETH_DMACiCR)*). It is only supported when the MAC operates in full-duplex mode.

For detailed programming steps, refer to *Section 64.9.12: Programming guidelines for TSO*.

**Figure 790. TCP segmentation offload overview**



### Enabling the TSO feature

To enable segmentation for a packet, the application must set the TSE bit of TDES3 of first normal descriptor (see *Section 64.10.3: Transmit descriptor*).

The application must program the length of the TCP packet payload in TDES3[17:0] and the TCP header in TDES3[22:19]. The maximum length of TCP packet payload that can be segmented is 256 Kbytes.

The header of the packet including Ethernet header, L3 header and L4 header should be provided in Buffer1 of the first normal descriptor of the TSO packet. Only buffer 1 of the first normal descriptor of a packet enabled for TSO is taken as the buffer containing the header.

The TCP payload can begin from buffer 2 of the first normal descriptor and continue to buffer1 and buffer 2 of second normal descriptor and subsequent descriptors.

The TCP payload may span across multiple buffers and multiple descriptors. The size of buffers containing the TCP payload should add up to be equal to the TCP payload length provided in TDES3[17:0] of the first normal descriptor.

The MAC always calculates and appends CRC and inserts Padding (if required) for all packets segmented by the DMA. If the TSE bit of TDES3 is enabled, the CRC PAD Control (CPC) field of TDES3 is reserved. To determine the size of a TCP packet after segmentation, the DMA uses the Maximum Segment Size (MSS) provided by the application through context descriptor. The DMA segments only those packets which have payload size greater than MSS. The application must provide the MSS by either programming the MSS value in ETH_DMACiCR (see *Channel i control register (ETH_DMACiCR)*) or by providing a context descriptor. The DMA uses the last programmed value of MSS or the last MSS value provided through context (whichever is provided later).

The header length plus the MSS size (which is equal to the size of each TCP segment) should not exceed 16383 bytes otherwise the MAC transmitter truncates the packet after 16383 bytes causing a CRC error.

The header length plus MSS size plus programmed PBL value in ETH_DMACiTXCR register (see *Channel i transmit control register (ETH_DMACiTXCR)*) should be lesser than the Tx queue size programmed in TQS field of ETH_MTLTXQiOMR register (see *Tx queue i*

*operating mode Register (ETH_MTLTXQiOMR)*). A MSS plus header equal to half the programmed Tx queue size is recommended.

If the TCP packet has a VLAN tag, then the same tag is used for all the segments irrespective of the VLAN tag type provided (C-VLAN or S-VLAN). The VLAN tag insert/replace control bits are used for all segments.

If the Double VLAN feature is selected, then the DMA passes both tags for all segments irrespective of the VLAN tag types provided (C-VLAN or S-VLAN). The VLAN tag Insert/Replace control bits for both tags is applicable to all segments. If the Double VLAN feature is not selected, then the application must not set the TSE bit in TDES3 for a TCP/IP packet with two tags. The DMA behavior in this scenario is unpredictable.

### TCP/IP header fields

While segmenting a TCP packet, the DMA automatically updates the TCP/IP header fields. *Table 491* describes how the TCP and IP headers are updated.

**Table 491. TSO: TCP and IP header fields**

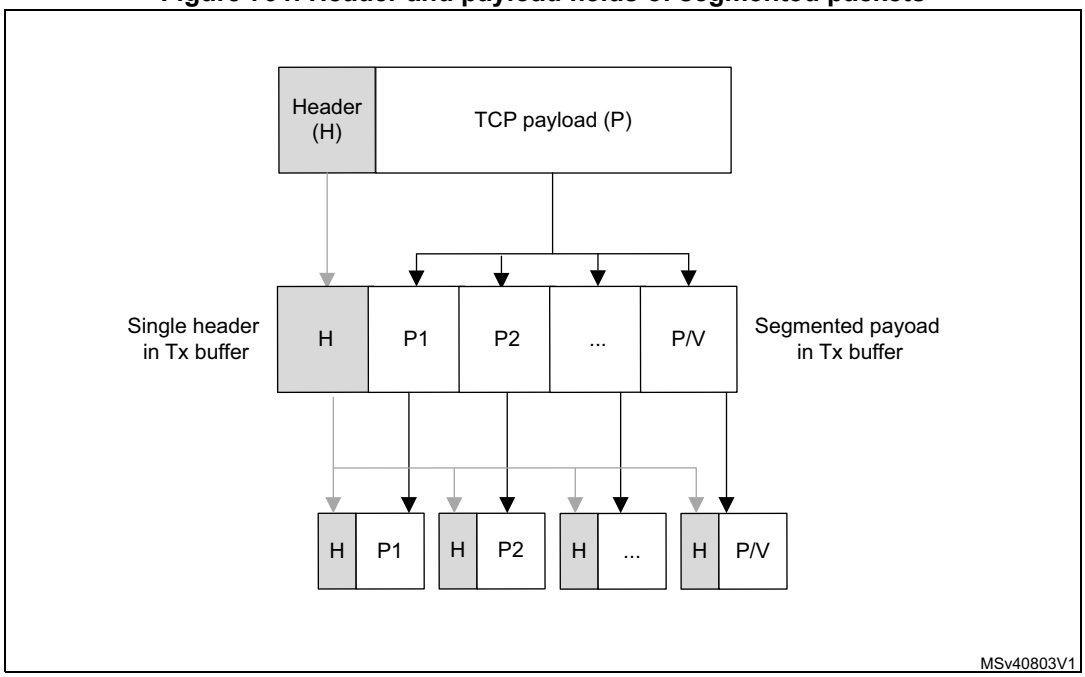
| Packet sequence | TCP header | IP header |
|---|---|---|
| First packet | 1. The sequence number is not updated. The value provided in the header is used.<br>2. If set, the FIN and PSH flags are cleared.<br>3. The TCP checksum is calculated again. | IPv4 Header<br>– Total Length = MSS + TCP Header Length + IP Header Length<br>– Identification field is not modified. It is sent as per the header provided by the software.<br>– IPv4 Header Checksum is recalculated.<br>IPv6 Header<br>– Payload Length = MSS + TCP Header Length + IP Extension Header Length |
| Subsequent packets | 1. The sequence number is updated. The MSS value is added to the sequence number value of previous segment.<br>2. If set, the FIN and PSH flags are cleared.<br>3. The TCP checksum is calculated again. | IPv4 Header<br>– Total Length = MSS + TCP Header Length + IP Header Length<br>– Identification field = Previous Identification Field + 1<br>– IPv4 Header Checksum is recalculated<br>IPv6 Header<br>– Payload Length = MSS + TCP Header Length + IP Extension Header Length |
| Last packet | 1. The sequence number is updated. The MSS value is added to the sequence number value of previous segment.<br>2. If FIN and PSH flags were set in original header, these flags are set.<br>3. The TCP checksum is calculated again. | IPv4 Header<br>– Total Length = Remaining Payload + TCP Header Length + IP Header Length<br>– Identification Field = Previous Identification Field + 1<br>– IPv4 header Checksum is recalculated<br>IPv6 Header<br>– Payload Length = Remaining Payload Length + TCP Header Length + IP Extension Header Length |

### Header and payload fields of segmented packets

After segmentation, the split packets use the same header as the parent TCP packet for header fields other than the ones described in *Table 491: TSO: TCP and IP header fields*. *Figure 791: Header and payload fields of segmented packets* shows how same header is used for the header fields of segmented packets.

The application must create the header in Buffer 1 of the first descriptor of the packet to be segmented and provide the header length in TDES2 of the first descriptor (FD = 1). When the FD bit is set, the DMA reads the header from the header buffer to which the TDES0 is pointing. Buffer 2 of the first descriptor can be used for payload and TDES0 and TDES1 of subsequent descriptors. For subsequent descriptors (FD = 0), the address to which the TDES0 and TDES1 are pointing is treated as payload buffer address of the same packet.

**Figure 791. Header and payload fields of segmented packets**



### Context descriptor sequence

The context descriptor can provide the maximum segment size (MSS) value for segmentation. The application must provide the context descriptor before the normal descriptor to be used for the corresponding TCP packet. If the application needs to provide a new MSS, it must create the context descriptor in the descriptor list before the first normal descriptor of the packet to be segmented with the new MSS value. The MSS value in the context descriptor is valid only if the TCMSSV bit of TDES3 in context descriptor is set and the OSTC bit is reset (refer to *Section 64.10.3: Transmit descriptor*).

When the application provides a context descriptor with a valid MSS value, the DMA internally stores the MSS value and uses this value for all subsequent packets for which the TSO is enabled through the TSE bit of TDES3 normal descriptor.

If the application places a context descriptor in the middle of a packet (between the first and last descriptors of a packet), the DMA does the following:

1. The DMA ignores the context and closes the descriptor.
2. The DMA indicates the error in descriptor status.
3. The DMA generates an interrupt if the CDEE bit is set in the Interrupt enable register corresponding to a DMA channel (see *Channel i interrupt enable register (ETH_DMACiIER)*).

The application can read the interrupt status through CDE bit of Status register corresponding to a DMA channel (see *Channel i status register (ETH_DMACiSR)*).

### 64.5.7 Loopback

The MAC supports the Loopback of transmitted packets to its receiver. By default, the MAC Loopback function is disabled, but it can be enabled by programming the LM bit of the *Operating mode configuration register (ETH_MACCR)* register.

The Loopback function is available for all PHY interfaces. The data is always looped back on the GMII or MII interface irrespective of which PHY interface is selected.

### 64.5.8 Flow control

This section describes the flow control for Transmit and Receive paths.

#### Transmit flow control

The Transmit Flow Control is enabled when TFE bit is set in *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)*.

**Flow control trigger**

The Transmit Flow Control involves transmitting Pause packets in full-duplex mode and backpressure in half-duplex mode to control the flow of packets from the remote end. The application can request the MAC to send a Pause packet or initiate backpressure by using setting the FCB bit in the corresponding *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)*.

**Flow control in full-duplex mode: pause packets control**

In full-duplex mode, the MAC uses IEEE 802.3x Pause packets for flow control. *Table 492* describes the fields of a Pause packet.

**Table 492. Pause packet fields**

| Field | Description |
|---|---|
| DA | Contains the special multicast address |
| SA | Contains the MAC address 0 |
| Type | Contains 8808 |
| MAC Control opcode | Contains 0001 for IEEE 802.3x Pause Control packets; 0101 for PFC packets |
| PT | Contains Pause time specified in the PT field of the *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)* |

When the FCB bit is set, the MAC generates and transmits a single Pause packet. If the FCB bit is set again after the Pause packet transmission is complete, the MAC sends another Pause packet irrespective of whether the pause time is complete or not. To extend the pause or terminate the pause prior to the time specified in the previously-transmitted Pause packet, the application should program the Pause Time register with appropriate value and then again set the FCB bit.

### Flow control in half-duplex mode

In half-duplex mode, the MAC uses the deferral mechanism for the flow control (backpressure). When the application requests to stop receiving packets, the MAC sends a JAM pattern of 32 bytes when it senses a packet reception, provided the transmit flow control is enabled. This results in a collision and the remote station backs off. If the application requests a packet to be transmitted, it is scheduled and transmitted even when the backpressure is activated. If the backpressure is kept activated for a long time (and more than 16 consecutive collision events occur), the remote stations abort the transmission because of excessive collisions.

*Table 493* describes the flow control in the Tx path for Queue 0 based on the setting of the following bits:

- EHFC bit of *Rx queue i operating mode register (ETH_MTLRXQiOMR)*
- TFE bit of *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)*
- DM bit of *Operating mode configuration register (ETH_MACCR)*

Flow control is similar for all queues.

**Table 493. Tx MAC flow control**

| EFC | TFE | DM | Description |
|---|---|---|---|
| x | 0 | x | The MAC transmitter does not perform the flow control or backpressure operation. |
| 0 | 1 | 0 | The MAC transmitter performs backpressure when Bit 0 of *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)* is set. |
| 1 | 1 | 0 | The MAC transmitter performs backpressure when Bit 0 of *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)* is set. In addition, the MAC Tx performs backpressure when Rx queue level crosses the threshold set by Bits[10:8] of *Rx queue i operating mode register (ETH_MTLRXQiOMR)*. |
| 0 | 1 | 1 | The MAC transmitter sends the Pause packet when Bit 0 of *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)* is set. |
| 1 | 1 | 1 | The MAC transmitter sends the Pause packet when Bit 0 of *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)* is set. In addition, the MAC Tx sends a Pause packet when Rx queue level crosses the threshold set by Bits[10:8] of *Rx queue i operating mode register (ETH_MTLRXQiOMR)*. |

### Receive flow control

In the Receive path, the flow control is functional only in full-duplex mode. If any Pause packet is received in half-duplex mode, the packet is considered as a normal control packet. You can enable the Pause flow control by setting the RFE bit in the *Rx flow control register (ETH_MACRXFCR)*. *Table 494* describes the flow control in the Rx path based on the setting of the following bits:

- RFE bit of *Rx flow control register (ETH_MACRXFCR)*
- DM bit of *Operating mode configuration register (ETH_MACCR)*

**Table 494. Rx MAC Flow Control**

| RFE | DM | Description |
|---|---|---|
| 0 | x | The MAC receiver does not detect the received Pause packets. |
| 1 | 0 | The MAC receiver does not detect the received Pause packets but recognizes such packets as Control packets. |
| 1 | 1 | The MAC receiver detects or processes the Pause packets and responds to such packets by stopping the MAC transmitter. |

In configurations with multiple queues, you can enable the PFC packet detection by setting the PFCE bit in the *Rx flow control register (ETH_MACRXFCR)*. If PFC packet detection is enabled, the MTL Tx queue corresponding to the received priority is blocked when the PFC packet is received. If PFC packet detection is not enabled in configurations with multiple queues and RFE bit is enabled, the MAC transmitter is blocked when the 802.3x Pause packet is received.

The following sequence describes the Rx flow control:

1. The MAC checks the destination address of the received Pause packet for either multicast or unicast destination address.
2. The MAC decodes the following fields of the received packet:
   – Type field: this field is checked for 0x8808.
   – Opcode field: this field is checked for 0x0001 (Pause packet) or 0x0101 (PFC packet).
   – Pause Time or Pause Time Vector field:

     The Pause time (for Pause packet) is captured to determine the time for which transmitter needs to be blocked.

     The Pause Time Vector field (for PFC packet) is captured to determine the time for which the MTL Tx queue corresponding to the received priority needs to be blocked.
   – Priority Enable Vector field:

     This field is valid only for PFC packets. It is captured to determine the MTL Tx queue corresponding to the received priority.
3. If the byte count of the status indicates 64 bytes and there is no CRC error, the MAC transmitter does one of the following:
   – For 802.3x Pause packets, the MAC pauses the transmission of any data packet for the duration of the decoded Pause Time value multiplied by the slot time (64 byte times).
   – For PFC packets, the MAC blocks the Tx queues corresponding to the priority. Based on the priorities assigned to the Tx queues, the MAC loads the Pause timer corresponding to the priority. The Tx queue corresponding to the priority is blocked till the Pause timer expires.
4. The MAC transfers the received control packet to the application based on the setting of the PCF field in *Packet filtering control register (ETH_MACPFR)*.
5. If subsequent Pause or PFC packets are received before the earlier Pause Time expires, the MAC updates the Pause Timer with new value.

### 64.5.9 Checksum offload engine

Communication protocols such as TCP and UDP implement checksum fields, which help determine the integrity of data transmitted over a network. The most widespread use of Ethernet is to encapsulate TCP and UDP over IP datagrams. The MAC has a Checksum Offload Engine (COE) to support checksum calculation and insertion in the Transmit path, as well as error detection in the Receive path.

#### Transmit checksum offload engine

The COE module supports two types of checksum calculation and insertion. The checksum engine can be controlled for each packet by setting the CIC bits (TDES3 bits[17:16]).

*Note: The checksum for TCP, UDP, or ICMP is calculated over a complete packet, and then inserted into its corresponding header field. Because of this requirement the Tx FIFO automatically operates in the store-and-forward mode even if the MAC is configured for Threshold (cut-through) mode.*

**IP header checksum engine**

In IPv4 datagrams, the integrity of the header fields is indicated by the 16-bit Header Checksum field (the eleventh and twelfth bytes of the IPv4 datagram). The COE detects an IPv4

datagram when the Type field of Ethernet packet has the value 0x0800 and the Version field of IP datagram has the value 0x4. The checksum field of the input packet is ignored during calculation and replaced with the calculated value.

IPv6 headers do not have a checksum field. Therefore, the COE does not modify the IPv6 header fields.

The result of this IP header checksum calculation is indicated by the IP Header Error status it in the Transmit status (bit 0 in *Table 508: TDES3 normal descriptor (write-back format)*).

**TCP/UDP/ICMP checksum engine**

The TCP/UDP/ICMP Checksum Engine processes the IPv4 or IPv6 header (including extension headers) and determines whether the encapsulated payload is TCP, UDP, or ICMP. The checksum is calculated for the TCP, UDP, or ICMP payload and inserted into its corresponding field in the header. The Tx COE can work in the following two modes:

- The TCP, UDP, or ICMPv6 pseudo-header is not included in the checksum calculation and is assumed to be present in the Checksum field of the input packet. This engine includes the Checksum field in the checksum calculation, and then replaces the Checksum field with the final calculated checksum.
- The engine ignores the Checksum field, includes the TCP, UDP, or ICMPv6 pseudo-header data into the checksum calculation, and overwrites the checksum field with the final calculated value.

*Note: For ICMP-over-IPv4 packets, the Checksum field in the ICMP packet must always be 0x0000 in both modes, because pseudo-headers are not defined for such packets. If it does not equal 0x0000, an incorrect checksum may be inserted into the packet.*

The result of this operation is indicated by the Payload Checksum Error status bit in the Transmit Status vector (bit 12 in *Table 508: TDES3 normal descriptor (write-back format)*). This engine sets the Payload Checksum Error status bit when it detects that the packet has been forwarded to the MAC Transmitter engine in the store-and-forward mode without the end of packet (EOP) being written to the FIFO, or when the packet ends before the number of bytes indicated by the Payload Length field in the IP Header is received. When the packet is longer than the indicated payload length, the COE ignores them as stuff bytes, and no error is reported. When this engine detects the first type of error, it does not modify the TCP, UDP, or ICMP header. For the second error type, it still inserts the calculated checksum into the corresponding header field.

*Table 495* describes the functions supported by Transmit Checksum Offload engine based on the packet type. When the MAC does not insert the checksum, it is indicated as “No” in the table.

**Table 495. Transmit checksum offload engine functions for different packet types**

| Packet type | Hardware IP header checksum insertion | Hardware TCP/UDP checksum insertion |
|---|---|---|
| Non-IPv4 or IPv6 packet | No | No |
| IPv4 with TCP, UDP, or ICMP | Yes | Yes |
| IPv4 packet has IP options (IP header is longer than 20 bytes) | Yes | Yes |
| Packet is an IPv4 fragment | Yes | No |
| IPv6 packet with the following next header fields in main or extension headers:<br>– Hop-by-hop options (in IPv6 main header)<br>– Hop-by-hop options (in IPv6 extension header)<br>– Destinations options<br>– Routing (with segment left 0)<br>– Routing (with segment left > 0)<br>– TCP, UDP, or ICMP<br>– Authentication<br>– Any other next header field in main or extension headers | <br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable | <br>– Yes<br>– No<br>– Yes<br>– No<br>– No<br>– Yes<br>– Yes<br>– No |
| IPv4 packet has TCP header with Options fields | Yes | Yes |
| IPv4 Tunnels:<br>– IPv4 packet in an IPv4 tunnel<br>– IPv6 packet in an IPv4 tunnel | <br>– Yes (IPv4 tunnel header)<br>– Yes (IPv4 tunnel header) | <br>– No<br>– No |
| IPv6 Tunnels:<br>– IPv4 packet in an IPv6 tunnel<br>– IPv6 packet in an IPv6 tunnel | <br>– Not applicable<br>– Not applicable | <br>– No<br>– No |
| IPv4 packet has 802.3ac tag (with C-VLAN tag or S-VLAN Tag when enabled). | Yes | Yes |
| IPv6 packet has 802.3ac tag (with C-VLAN tag or S-VLAN Tag when enabled). | Not applicable | Yes |
| IPv4 frames with security features (such as encapsulated security payload) | Yes | No |
| IPv6 frames with security features (such as encapsulated security payload) | Not applicable | No |

### Receive checksum offload engine

You can enable the Receive Checksum Offload Engine (Rx COE) by selecting the *Enable Receive TCP/IP Checksum Check* option and setting the IPC bit of *Operating mode configuration register (ETH_MACCR)*. When this option is selected, both IPv4 and IPv6 packet in the received Ethernet packets are detected and processed for data integrity. The MAC receiver identifies IPv4 or IPv6 packets by checking for value 0x0800 or 0x86DD, respectively, in the Type field of the received Ethernet packet. This identification is applicable to single VLAN-tagged packets. It is also applicable to double VLAN-tagged packets when the *Enable Double VLAN Processing* option is selected and the EDVLP bit of the *VLAN tag register (ETH_MACVTR)* is set.

The Rx COE calculates the IPv4 header checksums and checks that they match the received IPv4 header checksums. The result of this operation (pass or fail) is given to the RFC module for insertion into the receive status word. The IP Header Error bit is set for any mismatch between the indicated payload type (Ethernet Type field) and the IP header version, or when the received packet does not have enough bytes, as indicated by the Length field of the IPv4 header (or when fewer than 20 bytes are available in an IPv4 or IPv6 header).

This engine also identifies a TCP, UDP, or ICMP payload in the received IP datagrams (IPv4 or IPv6) and calculates the checksum of such payloads properly, as defined in the TCP, UDP, or ICMP specifications. This engine includes the TCP, UDP, or ICMPv6 pseudo-header bytes for checksum calculation and checks whether the received checksum field matches the calculated value. The result of this operation is given as a Payload Checksum Error bit in the receive status word. This status bit is also set if the length of the TCP, UDP, or ICMP payload does not match the expected payload length given in the IP header.

*Table 496: Receive checksum offload engine functions for different packet types* describes the functions supported by the Rx COE based on the packet type. When the payload of an IP packet is not processed (indicated as "No" in the table), the information (whether the checksum engine is bypassed or not) is given in the receive status.

*Note: The MAC does not append any payload checksum bytes to the received Ethernet packets.*

**Table 496. Receive checksum offload engine functions for different packet types**

| Packet type | Hardware IP header checksum checking | Hardware TCP/UDP/ICMP checksum checking |
|---|---|---|
| Non-IPv4 or IPv6 | No | No |
| IPv4 with TCP, UDP, or ICMP | Yes | Yes |
| IPv4 header's protocol field contains a protocol other than TCP, UDP, or ICMP | Yes | No |
| IPv4 packet has IP options (IP header is longer than 20 bytes) | Yes | Yes |
| Packet is an IPv4 fragment | Yes | No |

**Table 496. Receive checksum offload engine functions for different packet types (continued)**

| Packet type | Hardware IP header checksum checking | Hardware TCP/UDP/ICMP checksum checking |
|---|---|---|
| IPv6 packet with the following next header fields in main or extension headers:<br>– Hop-by-hop options (in IPv6 main header)<br>– Hop-by-hop options (in IPv6 extension header)<br>– Destinations options<br>– Routing (with segment left 0)<br>– Routing (with segment left > 0)<br>– TCP, UDP, or ICMP<br>– Any other next header field in main or extension headers | <br><br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable<br>– Not applicable | <br><br>– Yes<br>– No<br>– Yes<br>– Yes<br>– No<br>– Yes<br>– No |
| IPv4 packet has TCP header with Options fields | Yes | Yes |
| IPv4 Tunnels:<br>– IPv4 packet in an IPv4 tunnel<br>– IPv6 packet in an IPv4 tunnel | <br>– Yes (IPv4 tunnel header)<br>– Yes (IPv4 tunnel header) | <br>– No<br>– No |
| IPv6 Tunnels:<br>– IPv4 packet in an IPv6 tunnel<br>– IPv6 packet in an IPv6 tunnel | <br>– Not applicable<br>– Not applicable | <br>– No<br>– No |
| IPv4 packet has 802.3ac tag (with C-VLAN Tag or S-VLAN Tag when enabled). | Yes | Yes |
| IPv6 packet has 802.3ac tag (with C-VLAN Tag or S-VLAN Tag when enabled). | Not applicable | Yes |
| IPv4 frames with security features (such as encapsulated security payload) | Yes | No |
| IPv6 frames with security features (such as encapsulated security payload) | Not applicable | No |

### 64.5.10 MAC management counters

The counters in the MAC Management Counters (MMC) module can be viewed as an extension of the register address space of the CSR module. The MMC module maintains a set of registers for gathering statistics on the received and transmitted packets. The register set includes a control register for controlling the behavior of the registers, two 32-bit registers containing interrupts generated (receive and transmit), and two 32-bit registers containing masks for the Interrupt register (receive and transmit). These registers are accessible from the Application through the AHB slave interface in the same way the CSR registers are accessed. The organization of these registers is shown in *Section 64.11.4: Ethernet MAC and MMC registers*.

The MMC counters are free running. There is no separate enable for the counters to start. A particular MMC counter starts counting when corresponding packet is received or transmitted.

In addition to control registers, two sets of registers are implemented:

- 6 registers used for collision, error and good packets counters
- 4 registers to record LPI mode transition

### 64.5.11 Interrupts generated by the MAC

Interrupts can be generated from the MAC as a result of various events. These interrupt events are combined with the events in the DMA on the eth_sbd_intr_it signal. The MAC interrupts are of level type, that is, the interrupt remains asserted (high) until it is cleared by the application or software.

The *Interrupt status register (ETH_MACISR)* describes the events that can cause an interrupt from the MAC. The MAC interrupts are enabled by default. Each event can be prevented from asserting the interrupt on the eth_sbd_intr_it signals by setting the corresponding mask bits in the *Interrupt enable register (ETH_MACIER)*.

The interrupt register bits only indicate the block from which the event is reported. You must read the corresponding status registers and other registers to clear the interrupt.

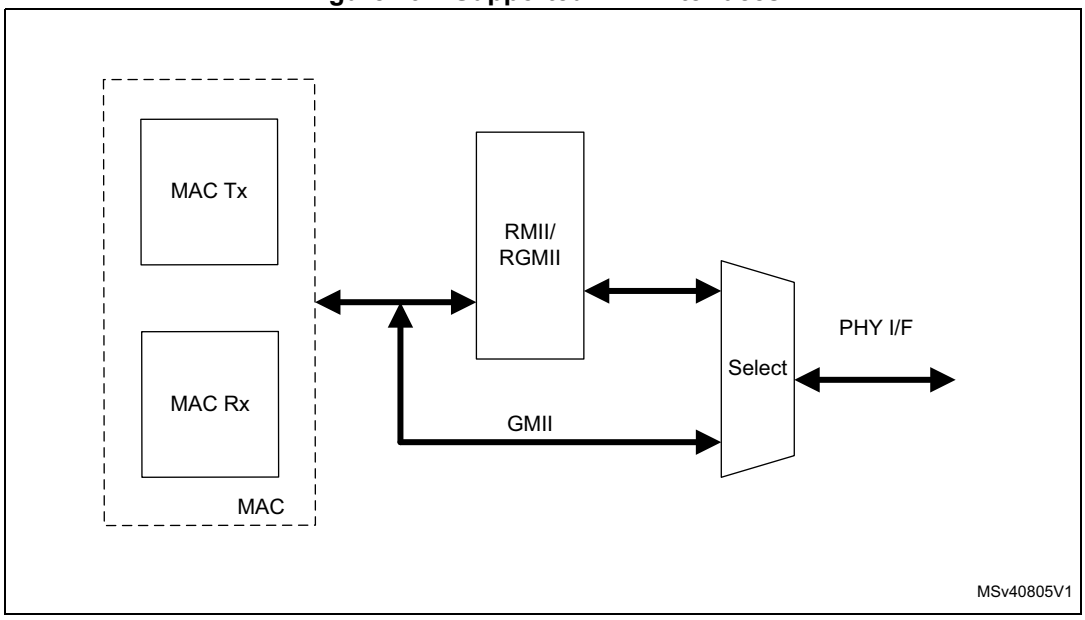
### 64.5.12 MAC and MMC register descriptions

Refer to *Section 64.11.4: Ethernet MAC and MMC registers*.

## 64.6 Ethernet functional description: PHY interfaces

The Ethernet peripheral support several PHY interfaces. The root interface is the MII/GMII one. All other interfaces are derived from it as shown in *Figure 792*.

**Figure 792. Supported PHY interfaces**



This section describes the SMA module used for PHY control and different PHY interfaces. It contains the following sections:

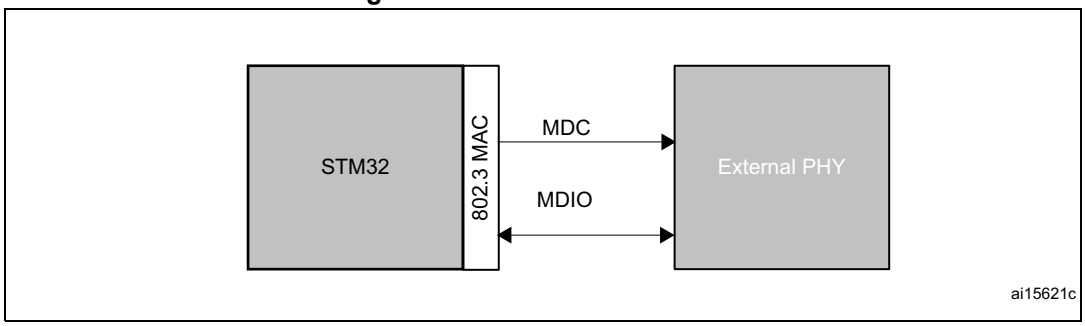
- *Station management agent (SMA)*
- *Giga Media Independent Interface (GMII)*
- *Reduced media independent interface (RMII)*
- *Reduced gigabit media independent Interface (RGMII)*

### 64.6.1 Station management agent (SMA)

The application can access the PHY registers through the station management agent (SMA) module. The SMA includes a two-wire station management interface (MIM).

The SMA module supports accessing up to 32 PHYs. The application can address one of the 32 registers from any 32 PHYs. Only one register in one PHY can be addressed at a time. The application sends the control data to the PHY and receives status information from the PHY through the SMA module, as shown in *Figure 793*.

**Figure 793. SMA Interface block**



## SMA functional overview

The MAC initiates the management write or read operation with respect to the MDC clock. The MDC clock is derived from the CSR clock. The division factor depends on the clock range setting in the *MDIO address register (ETH_MACMDIOAR)* register. The MDC clock is selected as follows:

**Table 497. MCD clock selection**

| Selection | CSR clock | MDC clock |
|---|---|---|
| 0000 | 60–100 MHz | CSR clock/42 |
| 0001 | 100–150 MHz | CSR clock/62 |
| 0010 | 20–35 MHz | CSR clock/16 |
| 0011 | 35–60 MHz | CSR clock/26 |
| 0100 | 150–250 MHz | CSR clock/102 |
| 0101 | 250–300 MHz | CSR clock/124 |
| 0110, 0111 | Reserved | - |

The data exchange between the MAC and the PHY is performed through mdi_i, mdo_o and mdo_oe signals. This signal group is passed through a three-state buffer and brought out as MDIO line connected to the PHY.

The following figure shows the structure of a packet on the MDIO packet while *Table 498* provides a detailed description of the packet fields.

**Figure 794. MDIO packet structure**

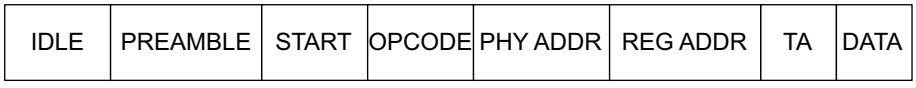


**Table 498. MDIO packet field description**

| Field | Description |
|---|---|
| IDLE | The MDIO line is three-state; there is no clock on ETH_MDC. |

**Table 498. MDIO packet field description**

| | |
|---|---|
| PREAMBLE | 32 continuous bits of value 1 |
| START | Start of packet is 2'01 |
| OPCODE | 2'b10 for Read and 2'b01 for Write |
| PHY ADDR | 5-bit address select for one of 32 PHYs |
| REG ADDR | Register address in the selected PHY |
| TA | Turnaround is 2'bZ0 for Read and 2'b10 for Write |
| DATA | Any 16-bit value. In a Write operation, the MAC drives MDIO. In a Read operation, the PHY drives it. |

### GMII/MII management write operations

When bit[3:2] are set to 01 and bit 0 to 1 in the *MDIO address register (ETH_MACMDIOAR)*, the MAC CSR module transfers the PHY address, the register address in PHY, and the write data (*MDIO data register (ETH_MACMDIODR)*) to the SMA to initiate a Write operation into the PHY registers. At this point, the SMA module starts a Write operation on the GMII Management Interface using the Management Packet Format specified in the GMII specifications (as per IEEE 802.3-2002 specifications, *Section 22.2.4.5*).

When the SMA module starts a Write operation, the write data packet is transmitted on the MDIO line. The MAC drives the MDIO line for complete duration of the packet. The Busy bit is set high until the write operation is complete. The CSR ignores the Write operations performed to the *MDIO address register (ETH_MACMDIOAR)* or the *MDIO data register (ETH_MACMDIODR)* during this period (the Busy bit is high). When the Write operation is complete, the SMA module indicates this to the CSR, and the CSR resets the Busy bit. The packet format for the Write operation is as follows:

**Figure 795. Write data packet**

| IDLE | PREAMBLE | START | OPCODE | PHY ADDR | REG ADDR | TA | DATA | IDLE |
|---|---|---|---|---|---|---|---|---|
| Z | 1111..11 | 01 | 01 | AAAAA | RRRRR | 10 | DDD...DDD | Z |

MSv40807V1

### GMII/MII management read operation

When bit[3:2] are set to 11 and bit 0 to 1 in the *MDIO address register (ETH_MACMDIOAR)*, the MAC CSR module transfers the PHY address and the register address in PHY to the SMA to initiate a Read operation in the PHY registers. At this point, the SMA module starts a Read operation on the GMII/MII Management Interface using the Management Packet Format specified in the GMII/MII specifications (as per IEEE 802.3-2002 specifications, *Section 22.2.4.5*).

When the SMA module starts a Read operation on the MDIO, the CSR ignores the Write operations to the *MDIO address register (ETH_MACMDIOAR)* or *MDIO data register*

*(ETH_MACMDIODR)* register during this period (the Busy bit is high) and the transaction is completed without any error on the MCI interface. When the Read operation is complete, the SMA indicates this to the CSR. The CSR resets the Busy bit and updates the *MDIO data register (ETH_MACMDIODR)* with the data read from the PHY. The MAC drives the MDIO line for the complete duration of the frame except during the Data fields when the PHY is driving the MDIO line. For more information about the communication from the application to the PHYs, see the Reconciliation Sublayer and Media Independent Interface Specifications sections of the IEEE 802.3z, 1000BASE Ethernet.

The packet format for the Read operation is as follows:

**Figure 796. Read data packet**

| IDLE | PREAMBLE | START | OPCODE | PHY ADDR | REG ADDR | TA | DATA | IDLE |
|---|---|---|---|---|---|---|---|---|
| Z | 1111..11 | 01 | 10 | AAAAA | RRRRR | Z0 | DDD...DDD | Z |

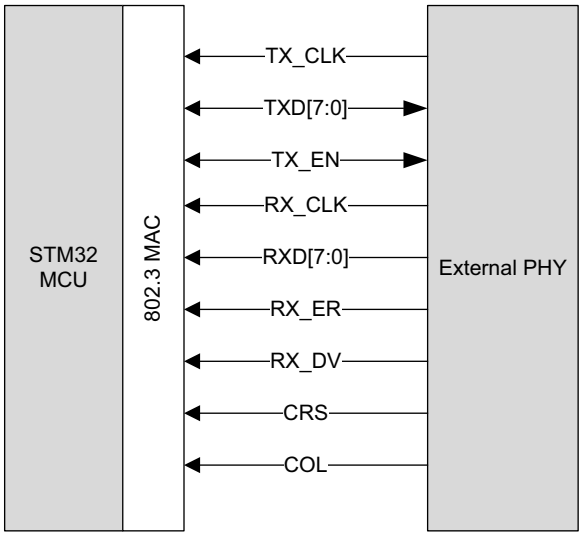
MSv40808V1

## 64.6.2 Giga Media Independent Interface (GMII)

The Gigabit-media-independent interface (GMII) defines the interconnection between the MAC sub-layer and the PHY for data transfer at 10 Mbit/s, 100 Mbit/s and 1000Mbit/s.

GMII signals are given in *Figure 797: Giga media independent interface (GMII) signals*.

**Figure 797. Giga media independent interface (GMII) signals**



MSv40810V1

- TX_CLK: continuous clock that provides the timing reference for Tx data transfers. The nominal frequency is 2.5 MHz at 10 Mbit/s and 25 MHz at 100 Mbit/s. At 1000 Mbit/s,

TX_CLK is output from an STM32 internal oscillator and transmitted to the PHY interface.

- RX_CLK: continuous clock that provides the timing reference for Rx data transfers. The nominal frequency is 2.5 MHz at 10 Mbit/s, 25 MHz at 100 Mbit/s and 125 MHz at 1000 Mbits/s.
- TX_EN: transmission enable signal indicating that the MAC is presenting nibbles on the MII for transmission. It must be asserted synchronously (TX_CLK) with the first nibble of the preamble and must remain asserted while all nibbles to be transmitted are presented to the MII.
- TXD[3:0]: transmit data.

  TXD is a bundle of 4 data signals driven synchronously by the MAC sub-layer and qualified (valid data) on the assertion of the TX_EN signal. TXD[0] is the least significant bit, TXD[3] is the most significant bit. While TX_EN is deasserted the transmit data must have no effect upon the PHY. In GMII mode, 8 bits are transmitted TXD[7:0].
- CRS: carrier sense.

  This signal is asserted by the PHY when either transmit or receive medium is non idle. It shall be deasserted by the PHY when both transmit and receive media are idle. The PHY must ensure that the CS signal remains asserted throughout the duration of a collision condition. This signal is not required to transition synchronously with respect to the Tx and Rx clocks. In full duplex mode the state of this signal is don't care for the MAC sub-layer.
- COL: collision detection signal

  This signal must be asserted by the PHY upon detection of a collision on the medium and must remain asserted while the collision condition persists. This signal is not required to transition synchronously with respect to the Tx and Rx clocks. In full-duplex mode the state of this signal is don't care for the MAC sub-layer.
- RXD[3:0]: reception data

  RXD is a bundle of 4 data signals driven synchronously by the PHY and qualified (valid data) on the assertion of the RX_DV signal. RXD[0] is the least significant bit, RXD[3] is the most significant bit. While RX_EN is deasserted and RX_ER is asserted, a specific RXD[3:0] value is used to transfer specific information from the PHY (see *Table 499*). In GMII mode, 8 bits are received RXD[7:0].
- RX_DV: receive data valid

  This signal indicates that the PHY is presenting recovered and decoded nibbles on the MII for reception. It must be asserted synchronously (RX_CLK) with the first recovered nibble of the frame and must remain asserted through the final recovered nibble. It must be deasserted prior to the first clock cycle that follows the final nibble. In order to receive the frame correctly, the RX_DV signal must encompass the frame, starting no later than the SFD field.
- RX_ER: receive error

  This signal must be asserted for one or more clock periods (RX_CLK) to indicate to the MAC sub-layer that an error was detected somewhere in the frame. This error condition must be qualified by RX_DV assertion as described in *Table 499*.

**Table 499. RX interface signal encoding**

| RX_DV | RX_ERR | RXD[3:0] | Description |
|---|---|---|---|
| 0 | 0 | 0000 through 1111 | Normal inter-frame |
| 0 | 1 | 0000 | Normal inter-frame |
| 0 | 1 | 0001 through 1101 | Reserved |
| 0 | 1 | 1110 | False carrier indication |
| 0 | 1 | 1111 | Reserved |
| 1 | 0 | 0000 through 1111 | Normal data reception |
| 1 | 1 | 0000 through 1111 | Data reception with errors |

### 64.6.3 Reduced media independent interface (RMII)

The Reduced media independent interface (RMII) specification reduces the pin count between Ethernet PHYs and STM32 MCU (only in 10/100 mode). According to the IEEE 802.3u, an MII contains 16 pins for data and control. RMII specification reduces the pin count to 7.

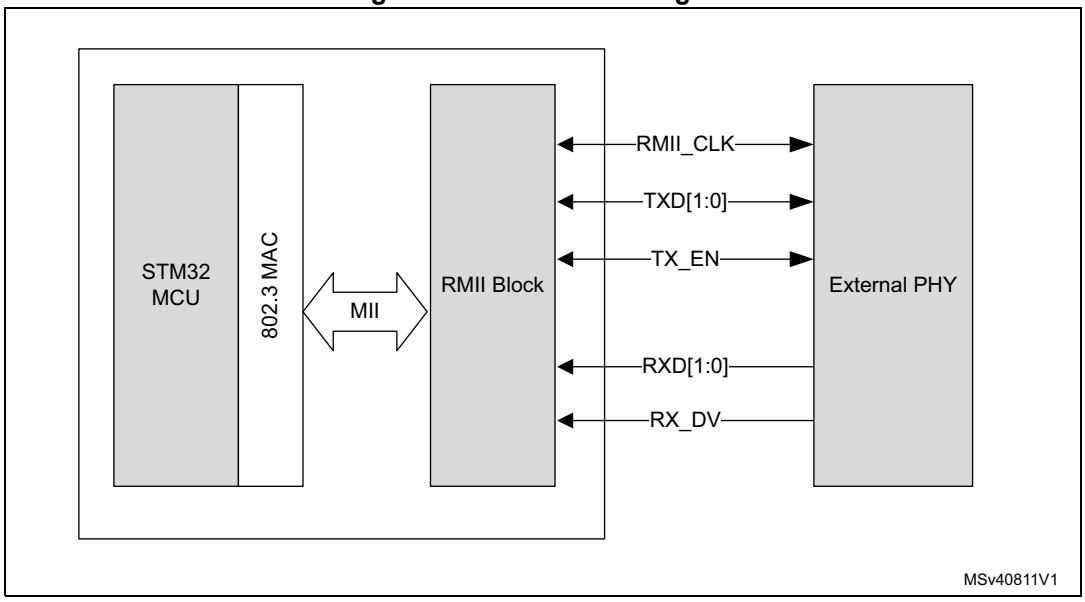
Part of the Ethernet peripheral, the RMII module is instantiated at the MAC output. This helps in translating the MII of the MAC into the RMII. The RMII block has the following characteristics:

- Supports 10 Mbps and 100 Mbps operating rates. It does not support the 1000 Mbps operation.
- Provides independent 2-bits wide Transmit and Receive paths by sourcing two clock references externally.

### RMII block diagram

*Figure 798: RMII block diagram* shows the position of the RMII block relative to the MAC and RMII PHY. The RMII block is placed in front of the MAC to translate the MII signals to RMII signals.

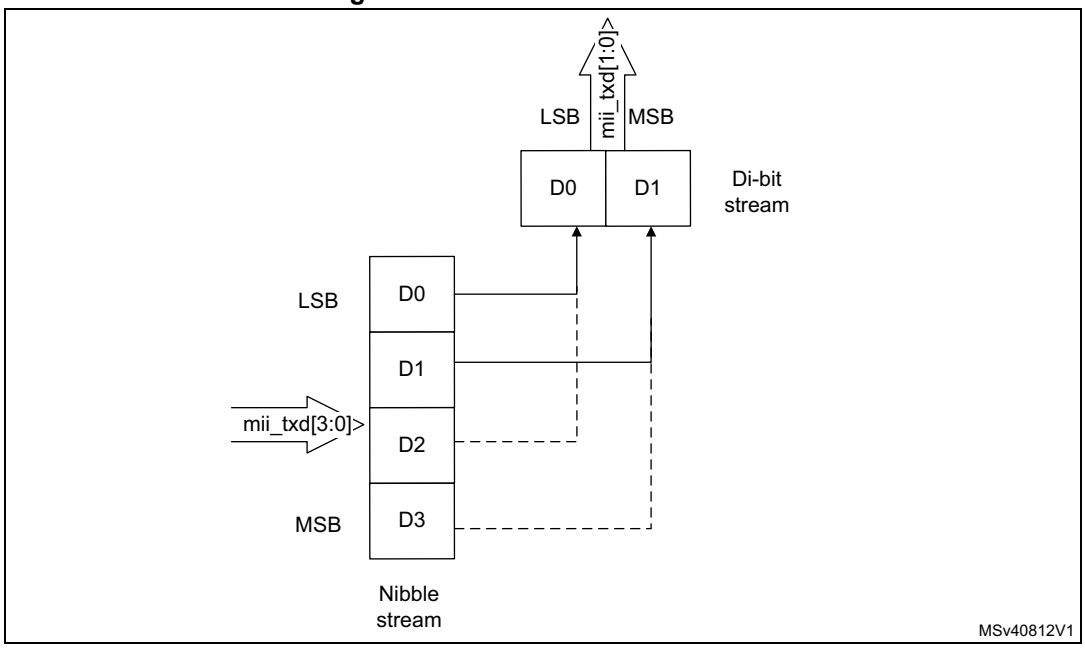
**Figure 798. RMII block diagram**



### Transmit bit order

Each nibble from the MII interface must be transmitted on the RMII interface di-bit at a time with the order of di-bit transmission shown in *Figure 799: Transmission bit order*. The lower order bits (D1 and D0) are transmitted first followed by higher order bits (D2 and D3).

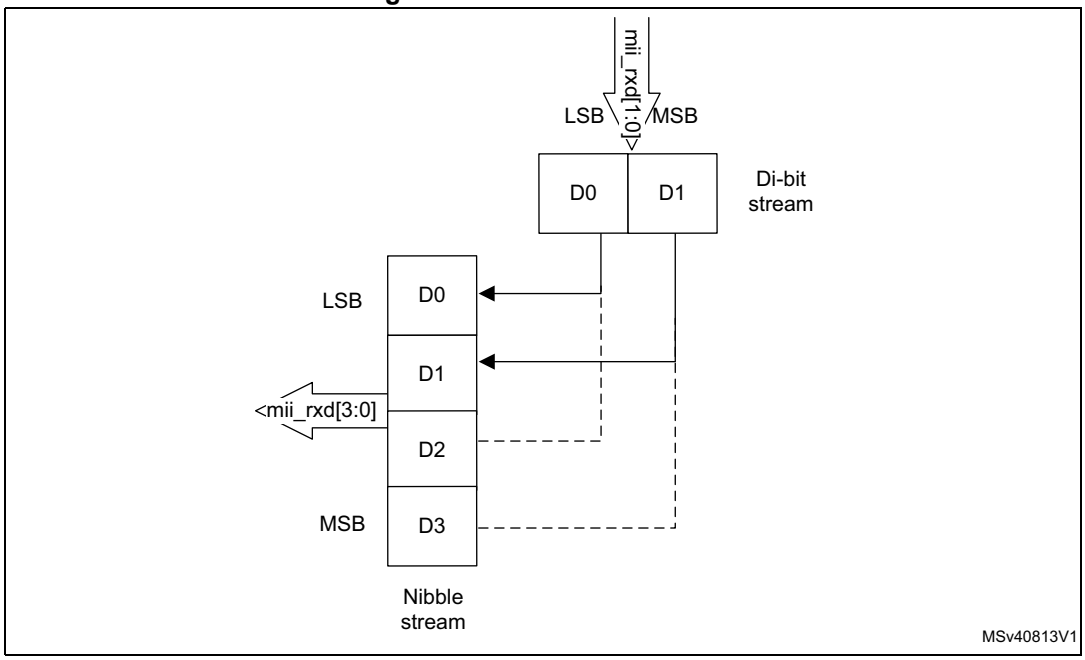
**Figure 799. Transmission bit order**



### Receive bit order

Each nibble is transmitted to the MII interface from the di-bit received from the RMII interface in the nibble transmission order shown in *Figure 800: Receive bit order*. The lower order bits (D0 and D1) are received first, followed by the higher order bits (D2 and D3).

**Figure 800. Receive bit order**



## 64.6.4 Reduced gigabit media independent Interface (RGMII)

The Reduced gigabit media independent interface (RGMII) specification reduces the pin count of the interconnection between the MAC and the PHY for GMII and MII interfaces. To achieve this, the data path and control signals are reduced and multiplexed together with both edges of the Transmit and Receive clocks. For Gigabit operation, the clocks operate at 125 MHz; for 10/100 operation, the clock rates are 2.5/25 MHz.

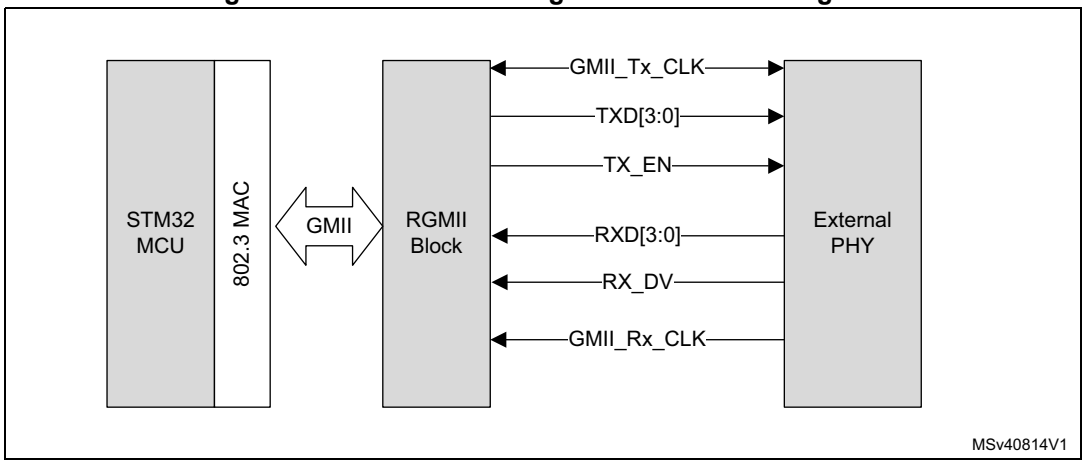
The RGMII module is instantiated between the GMII of the MAC and the PHY to translate the control and data signals between the GMII and RGMII protocols. The RGMII block has the following characteristics:

- Support of 10, 100 and 1000 Mbps operation rates.
- No extra clock required since both edges of the incoming clocks are used. To simplify back-end implementation of the MAC, there are separate clock inputs (180 degrees out-of-phase with the associated transmit/receive clocks) for logic that uses the falling edges.
- Extraction of the in-band (link speed, link status, and duplex mode) status signals from the PHY and provides them to the MAC for link detection.

## RGMII block diagram

*Figure 801: RGMII block diagram and interface signals* shows the position of the RGMII block relative to the MAC and RGMII PHY. The RGMII block is placed between the GMII and the PHY to translate the GMII signals to RGMII signals.

**Figure 801. RGMII block diagram and interface signals**



- **Transmit path**: this block translates all GMII transmit signals to RGMII signals. The block registers all GMII input signals at the rising edge of eth_mii_tx_clk and generates all RGMII transmit signals at the rising and falling edges of eth_mii_tx_clk.
- **Receive path:** this block translates all RGMII receive signals to GMII receive signals. The block registers all RGMII input signals at the rising and falling edges of eth_mii_rx_clk and generates all GMII receive signals at the rising edge of eth_mii_rx_clk.

## Signal conversion

The RGMII block performs data conversions in both directions.

### Transmit data conversion

As defined in the RGMII specification, multiplexing of data and control in Gigabit mode is accomplished by using both edges of the Transmit clock. The RGMII block accepts the 8-bit GMII transmit data from the MAC GMII (gmii_txd[7:0]) on the rising edge of eth_mii_tx_clk. For Gigabit operation, the RGMII block then converts gmii_txd[7:0] to two 4-bit nibbles and transmits the data on the RGMII transmit data port (rgmii_txd_o[3:0]) as follows:

- At the rising edge of eth_mii_tx_clk, rgmii_txd_o[3:0] contains gmii_txd[3:0]
- At the falling edge of eth_mii_tx_clk, rgmii_txd_o[3:0] contains gmii_txd[7:4]

For 10/100 mode, the Transmit data to the PHY is 4 bits. Therefore, for 10/100 mode, the RGMII block drives the gmii_txd[3:0] data to the PHY on rgmii_txd_o[3:0] at the rising edge of eth_mii_tx_clk.

#### Receive data conversion

In 1000 Mbps mode, the RGMII block registers the 4-bit data on the rgmii_rxd_i[3:0] signal at both edges of the Receive clock (eth_mii_rx_clk) and transfers the resulting 8-bit data to the MAC GMII on the rising edge of eth_mii_rx_clk clock, as follows:

- gmii_rxd[3:0] is the value received on rgmii_rxd_i[3:0] at the rising edge of eth_mii_rx_clk
- gmii_rxd[7:4] is the value received on rgmii_rxd_i[3:0] at the falling edge of eth_mii_rx_clk

In 10/100 mode, the RGMII block registers the 4-bit data on rgmii_rxd_i[3:0] only at the rising edge of eth_mii_rx_clk and transfers the data to the MAC GMII on the rising edge of eth_mii_rx_clk, as follows:

- gmii_rxd[3:0] is the value received on rgmii_rxd_i[3:0] at the rising edge of eth_mii_rx_clk.
- gmii_rxd[7:4] is 0x0.

## 64.7 Ethernet low-power modes

### 64.7.1 Energy Efficient Ethernet

Energy Efficient Ethernet (EEE) is an operating mode that enables the MAC sub-layer along with a family of Physical layers to operate in Low-power Idle (LPI) mode. The EEE mode supports operations at 100 Mbps and 1000 Mbps.

The LPI mode allows power saving to be achieved by switching off some of the communication device functions when there is no data to be transmitted and received. The MAC controls whether the system should enter or exit the LPI mode and communicates this to the PHY interface.

The EEE specifies the negotiation methods that the link partners can use to determine whether EEE is supported, and then select the set of parameters that are common to both devices.

*Note: The EEE feature is not supported when the MAC is configured to use the RMII single PHY interface. Even if the MAC supports multiple PHY interfaces, the EEE mode should be activate only when the MAC operates with the GMII, MII, or RGMII interface.*

*The LPI mode is supported only in full-duplex mode.*

#### Transmit path functions

In the Transmit path, the software must set the LPIEN bit of the *LPI control status register (ETH_MACLCSR)* to request the MAC to stop transmission and initiate the LPI protocol.

To exit the PHY from the LPI state, the MAC performs the following tasks:

1. Stops transmitting the LPI pattern and starts transmitting the IDLE pattern.
2. Starts the LPI TW TIMER:

   The MAC cannot start the transmission until the wakeup time specified for the PHY expires. The auto-negotiated wakeup interval is programmed in the TWT field of the *LPI control status register (ETH_MACLCSR)*.
3. Updates the LPI exit status (TLPIEX bit of the *LPI control status register (ETH_MACLCSR)*) and generates an interrupt.

Refer to *Section : Entering and exiting Tx LPI mode* for programming guideline of LPI mode.

**Automatically entering/exiting LPI mode in Tx path**

The MAC transmitter can be programmed to enter/exit LPI mode automatically based on whether it is IDLE for a specific period of time or has a packet to transfer. These modes are enabled and controlled by *LPI control status register (ETH_MACLCSR)*.

When LPITXA (bit19) and LPITXEN (bit16) of *LPI control status register (ETH_MACLCSR)* are set, the MAC transmitter enters LPI IDLE state when the MAC transmit path (including the MTL layers and DMA layers) are idle. The MAC transmitter will exit the LPI IDLE state and clear the LPITXEN bit as soon as any of functions in the Tx path (DMA, MTL or MAC) becomes non-idle due to initiation of a packet transfer.

In addition to the above, when Bit[20] (LPIATE) is also set, the MAC transmitter will enter LPI IDLE state only if the Transmit path remains in idle state (no activity) for the time period indicated by the value in *LPI entry timer register (ETH_MACLETR)*. In this mode also, the MAC transmitter will exit the LPI IDLE state as soon as any of the functions becomes non-idle. However, the LPITXEN bit is not cleared but remains active so that re-entry to LPI IDLE state is possible without any software intervention when the MAC becomes idle again.

When both LPIATE and LPITXA bits are cleared, you can directly control the entry and exit of LPI IDLE state by programming the LPITXEN bit.

#### Receive path functions

In the receive path, when the PHY receives the signals from the link partner to enter into the LPI state, the PHY goes in LPI mode and MAC updates the RLPIEN bit of the *LPI control status register (ETH_MACLCSR)* and immediately generates an interrupt.

When the PHY receives signals from the link partner to exit the LPI state, the PHY goes out of the LPI mode and MAC updates the RLPIEX bit of the *LPI control status register (ETH_MACLCSR)*. An interrupt is generated immediately.

#### LPI Interrupt

The MAC generates the LPI interrupt when the Tx or Rx side enters or exits the LPI state. The LPI interrupt can be cleared by reading the *LPI control status register (ETH_MACLCSR)*.

A sideband signal, lpi_intr_o, is generated together with the interrupt. This signal is used by the wakeup mechanism. It is ORed with pmt_intr_o signal (see *Section : PMT interrupts*) and tied to the EXTI peripheral (line 86).

### 64.7.2 Power management

The power management (PMT) block supports the reception of network (remote) wakeup packets and magic packets. The PMT block generates interrupts for remote wakeup packets and magic packets that the MAC receives.

When the power-down mode is enabled in the PMT block, the MAC drops all received packets and does not forward any packet to the RxFIFO or the application. The MAC comes out of the power-down mode only when a magic packet or a remote wakeup packet is received and the corresponding detection is enabled.

The PMT block is available in the receive path of MAC. Both types of power management packet (remote wakeup packet and magic packet) can be selected. RWKPKTEN and MGKPKTEN bits of the *PMT control status register (ETH_MACPCSR)* can be set to generate power management events.

The following are the PMT block registers:

- *PMT control status register (ETH_MACPCSR)*
- *Remote wakeup packet filter register (ETH_MACRWKPFR)*

#### Remote wakeup packet detection

When the MAC is in sleep mode and the remote wakeup bit is enabled in the *PMT control status register (ETH_MACPCSR)*, the normal operation is resumed after a remote wakeup packet is received.

**Remote wakeup frame filter register**

The PMT block supports 16 programmable filters that allow support of different receive packet patterns. If the incoming packet passes the address filtering of Filter Command, and if Filter CRC-16 matches the CRC of the incoming pattern, the MAC identifies the packet as a wakeup packet.

*Remote wakeup packet filter register (ETH_MACRWKPFR)* define the filtering management:

- Filter Byte Mask: determines which bytes of the packet must be examined
- Filter Offset: determines the offset from which the packet is to be examined
- Filter CRC-16

The remote wakeup CRC block determines the CRC value that is compared with Filter CRC-16. The remote wakeup packet is checked only for length error, FCS error, dribble bit error, receive error and collision. In addition, the remote wakeup packet is checked to ensure that it is not a runt packet. Even if the remote wakeup packet is more than 512 bytes long, if the packet has a valid CRC value, it is considered valid. The remote wakeup packet detection is updated in the PMT Control and Status register for every remote wakeup packet received. A PMT interrupt to the application triggers a Read to the PMT Control and Status register to determine reception of a remote wakeup packet.

### Magic packet detection

The magic packet is based on a method that uses the magic packet technology from Advanced Micro Device to power up the sleeping device on the network. The MAC receives a specific packet of information, called a magic packet, addressed to the node on the network.

The MAC checks only those magic packets that are addressed to the MAC or a multicast address (including broadcast address) to determine whether these packets meet the wakeup requirements. The magic packets that pass the address filtering (unicast or multicast (including broadcast) address) are checked to determine whether they meet the remote wakeup packet data format of 6 bytes of all ones followed by a Unicast MAC Address (that matches the value in MAC Address 0) appearing 16 times.

The application enables the magic packet wakeup by writing 1 to the MGKPKTEN bit of the *PMT control status register (ETH_MACPCSR)*. The PMT block constantly monitors each packet addressed to the node for a specific magic packet pattern. Each packet received is checked for a 48’hFF_FF_FF_FF_FF_FF pattern following the destination and source address field. The PMT block then checks the packet for 16 repetitions of the MAC address without any breaks or interruptions. In case of a break in the 16 repetitions of the address, the PMT block again scans the 48’hFF_FF_FF_FF_FF_FF pattern in the incoming packet. The 16 repetitions can be anywhere in the packet, but must be preceded by the synchronization stream (48’hFF_FF_FF_FF_FF_FF). The device can also accept a multicast packet, as long as the 16 duplications of the MAC address are detected. If the number of repetitions of 8'hFF are more than 6, the PMT block checks for 16 repetitions of the MAC address without any breaks or interruptions, after the last 6 repetitions of 8'hFF.

If the MAC address of a node is 48'h00_11_22_33_44_55, the MAC scans for the following data sequence:

Destination Address Source Address …….. FF FF FF FF FF FF
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55
…CRC

The MAC checks the remote wakeup packet only for length error, FCS error, dribble bit error, receive or collision error. In addition, the remote wakeup packet is checked to ensure

that it is not a runt packet. Even if the remote wakeup packet is more than 512 bytes long, if the packet has a valid CRC value, MAC considers it a valid packet.

The magic packet detection is updated in the *PMT control status register (ETH_MACPCSR)* for the received magic packet. A PMT interrupt to the Application triggers a read to the *PMT control status register (ETH_MACPCSR)* to determine whether a magic packet has been received.

#### PMT interrupts

The PMT interrupt signal is asserted when a valid remote wakeup packet is received.

When software resets the PWRDWN bit in *Remote wakeup packet filter register (ETH_MACRWKPFR)*, the MAC comes out of the power-down mode. This event does not generate the PMT interrupt.

As for EEE mode, a sideband signal, pmt_intr_o, is generated together with the wakeup interrupt. It is ORed with lpi_intr_o signal (see *Section : LPI Interrupt*) and tied to the EXTI peripheral (line 86).

### 64.7.3 Power-down and wakeup sequence

The recommended Power-down and wakeup sequence is as follows.

1. Disable the Transmit DMA and wait for any previous packet transmissions to complete. These transmissions can be detected when Transmit Interrupt (bit 0 of the ETH_DMACSR register) is received.
2. Disable the MAC transmitter and MAC receiver by clearing the corresponding bits (0 and 1) in the MAC Configuration register (ETH_MACCR).
3. Wait until the Receive DMA empties all the packets from the Rx FIFO to system memory. This can be done by reading the corresponding Debug register bits in the DMA (ETH_DMADSR) and MTL (ETH_MTLTXQDR and ETH_MTLRXQDR).
4. Enable Power-down mode by appropriately configuring the PMT registers ETH_MACPCSR and ETH_MACRWKPFR.
5. Enable the MAC Receiver and enter Power-down mode.
6. When receiving a valid remote wakeup packet, the Ethernet peripheral asserts the pmt_intr_o signal and exits Power-down mode.
7. Read the PMT Status register to clear the interrupt, then enable the other modules in the system and resume normal operation.

## 64.8 Ethernet interrupts

The Ethernet peripheral generates a single interrupt signal (eth_sbd_intr_it). This signal can be raised as a result of various events. These events are captured in status registers and interrupt enables are provided for each source of interrupt such that the interrupt signal is asserted for an event only when the corresponding interrupt enable is set.

The interrupt status and corresponding enable registers are organized in a hierarchical manner so that it is easier for software to traverse and identify the source of interrupt event quickly. When interrupt is asserted, the *Interrupt status register (ETH_DMAISR)* register is first level that indicates the major blocks for the interrupt event source. This register is read-only, and it contains bits corresponding to each DMA channel (TX & RX pair), the MTL, and the MAC. The software application must then read one (or more) of the following registers corresponding to the bits that are set:

- ETH_DMAC0SR: Channel 0 Status (see *Channel i status register (ETH_DMACiSR)*))
- ETH_DMAC1SR: Channel 1 Status (see *Channel i status register (ETH_DMACiSR)*)
- ETH_MTLISR: Interrupt Status (see *Interrupt status Register (ETH_MTLISR)*)
- ETH_MACISR: Interrupt Status (see *Interrupt status register (ETH_MACISR)*)

### 64.8.1 DMA interrupts

#### Interrupt registers description

The ETH_DMAC0SR: Channel 0 Status register (see *Channel i status register (ETH_DMACiSR)*) captures all the interrupt events of that TxDMA and RxDMA channel. The ETH_DMAC0IER: Channel 0 Interrupt Enable register (see *Channel i interrupt enable register (ETH_DMACiIER)*) contains the corresponding enable bits for each of the interrupt event.

There are two groups of interrupts in the DMA channel namely Normal and Abnormal interrupts.They are indicated by Bits[15:14] of ETH_DMAC0SR register respectively. The normal group is for events that happen during the normal transfer of packets (TI: transmit interrupt, RI: receive interrupt, TBU: Transmit buffer unavailable) while the abnormal interrupt events are for error events.

Interrupts are not queued. If the same interrupt event occurs again before the driver responds to the previous one, no additional interrupts are generated. An interrupt is generated only once for multiple events. The driver must scan the *Interrupt status register (ETH_DMAISR)* for the cause of the interrupt and clear the source in the respective Status register. The interrupt is cleared only when all the bits of *Interrupt status register (ETH_DMAISR)* are cleared.

#### Periodic scheduling of Transmit and Receive Interrupt

It is not preferable to generate interrupts for every packet transferred by DMA (RI and TI) for system throughput performance reasons. The Ethernet peripheral gives the flexibility to schedule the interrupt at regular intervals using two methods:

1. Set Interrupt on Completion bit in Transmit descriptor (TDES2[31] in *Table 503: TDES2 normal descriptor (read format)*) once for every “required” number of packets to be transmitted.
2. Similarly, set the IOC (RDES3[30] in*Table 516: RDES3 normal descriptor (read format)*) bit only at some specific intervals of Receive descriptors. This way, whenever

a received packet transfer to system memory is complete and any of the descriptors used for that packet transfer has the IOC bit set, only then the RI event is generated.

In addition to above, an interrupt timer (ETH_DMAC0RXIWTR: Channel 0 Rx Interrupt Watchdog Timer) is given for flexible control and periodic scheduling of Receive Interrupt. When this interrupt timer is programmed with a nonzero value, it gets activated as soon as the Rx DMA completes a transfer of a received packet to system memory without asserting the Receive Interrupt because the corresponding interrupt of completion IOC bit (RDES3[30] in *Table 516: RDES3 normal descriptor (read format)*) is not set. When this timer runs out as per the programmed value, RI bit is set and the interrupt is asserted if the corresponding RIE is enabled in ETH_DMAC0IER register (see *Channel i interrupt enable register (ETH_DMACiIER)*). The timer is stopped and cleared before it expires, if the RI is set for a packet transfer whose descriptor's IOC was set. The timer is reactivated automatically after the next packet transfer is complete without the RI event being generated.

### Channel Transfer Complete Interrupt

The Transmit Transfer complete interrupt (TI) and Receive Transfer complete interrupt (RI) is reflected in the Channel Status register (*Channel i status register (ETH_DMACiSR)*). The TI bit is set whenever the Tx DMA channel closes the descriptor in which the IOC bit is set (Interrupt On Completion - TDES2[31]). Similarly, the RI bit is set whenever the Rx DMA channel closes the descriptor with the LD bit set and, in any of the descriptors used for transferring that packet, IOC bit is set (Interrupt Enable on completion - RDES3[30])).

The interrupt signal is asserted for the Transfer complete interrupts only when the corresponding interrupts are enabled in the channel interrupt enable register (*Channel i interrupt enable register (ETH_DMACiIER)*).

The behavior of the RI/TI interrupts changes depending on the settings of INTM field (bit[17:16]) in the ETH_DMAMR register (*DMA mode register (ETH_DMAMR)*). *Table 500* explains the behavior of the Transfer Complete interrupt.

**Table 500. Transfer complete interrupt behavior**

| Interrupt mode | Behavior of TI/RI and eth_sbd_intr_it |
|---|---|
| INTM=0 | The TI/RI status signals are set whenever the Transfer complete event is detected. The bits get cleared whenever the software driver writes 1 to these bits. The eth_sbd_intr_it is asserted whenever the corresponding interrupts are also enabled in ETH_DMACxIER register. |
| INTM=1 | The TI/RI is set as explained above. However, the eth_sbd_intr_it is not asserted for any RI/TI events. |
| INTM=2 | The RI/TI status bits are set whenever the Transfer Complete event is detected and gets reset whenever software driver clears those bits by writing 1. However, if another Transfer Complete event is detected before it is cleared (serviced) by the software, these status bits is automatically set again. However, the eth_sbd_intr_it is not generated based on TI/RI. |

### 64.8.2 MTL interrupts

MTL interrupt events are combined with the events in the DMA to generate the interrupt signal.

The register *Interrupt status Register (ETH_MTLISR)* report the queue number responsible for the event. ETH_MTLQ0ICSR: Queue 0 Interrupt Control Status or ETH_MTLQ1ICSR: Queue 1 Interrupt Control Status shall be read for event description.

The MTL interrupts are enabled by default. Each event can be prevented from asserting the interrupt by setting the corresponding mask bits in the *Interrupt status Register (ETH_MTLISR)* register.

MTL interrupt signal is driven by one of these events on Queue 0 and Queue 1:

- Receive Queue Overflow Interrupt
- Transmit Queue Underflow

### 64.8.3 MAC Interrupts

MAC interrupt events are combined with the events in the DMA to generate the interrupt signal.

The MAC interrupts are of level type, that is, the interrupt remains asserted (high) until it is cleared by the application or software.

The *Interrupt status register (ETH_MACISR)* describes the events that can cause an interrupt from the MAC. The MAC interrupts are enabled by default. Each event can be prevented from asserting the interrupt by setting the corresponding mask bits in the *Interrupt status register (ETH_MACISR)*.

The interrupt register bits only indicate the block from which the event is reported. You must read the corresponding status registers and other registers to clear the interrupt.

MAC interrupt signal is driven by one of these events:

- Receive Status Interrupt
- Transmit Status Interrupt
- Timestamp Interrupt Status
- MMC Interrupt Status
  - MMC Receive Checksum Offload Interrupt Status
  - MMC Transmit Interrupt Status
  - MMC Receive Interrupt Status
- LPI Interrupt Status
- PMT Interrupt Status
- PHY Interrupt
- RGMII Interrupt Status

*Note: Two sidebands signals are generated together with LPI and PMT interrupts: lpi_intr_o and pmt_intr_o. They are used for wakeup event detection at EXTI level.*

## 64.9 Ethernet programming model

This chapter provides the instructions for initializing the DMA or MAC registers in the proper sequence. It contains the following sections:

- DMA initialization (see *Section 64.9.1*)
- MTL initialization (see *Section 64.9.2*)
- MAC initialization (see *Section 64.9.3*)

### 64.9.1 DMA initialization

Complete the following steps to initialize the DMA:

1. Provide a software reset to reset all MAC internal registers and logic (bit 0 of *DMA mode register (ETH_DMAMR)*).
2. Wait for the completion of the reset process (poll bit 0 of the *DMA mode register (ETH_DMAMR)*, which is cleared when the reset operation is completed).
3. Program the following fields to initialize the *System bus mode register (ETH_DMASBMR)*:
   a) AAL
   b) Fixed burst or undefined burst
   c) Outstanding requests limit value (OSR_LMT).
   d) If fixed length value is enabled, select the maximum burst length possible on the AXI Bus (bits [7:1])
4. Create a transmit and a receive descriptor list. In addition, ensure that the receive descriptors are owned by the DMA (set bit 31 of TDES3/RDES3 descriptor). For more information on descriptors, refer to *Section 64.10: Descriptors*.

*Note: Descriptor address from start to end of the ring should not cross the 4GB boundary.*

5. Program ETH_DMAC0TXRLR and ETH_DMAC0RXRLR registers (see *Channel i Tx descriptor ring length register (ETH_DMACiTXRLR)* and *Channel 0 Rx descriptor ring length register (ETH_DMAC0RXRLR)*). The programmed ring length must be at least 4.
6. Initialize receive and transmit descriptor list address with the base address of transmit and receive descriptor (*Channel i Tx descriptor list address register (ETH_DMACiTXDLAR)*, *Channel 0 Rx descriptor list address register (ETH_DMAC0RXDLAR)*). In addition, program the transmit and receive tail pointer registers that inform the DMA about the available descriptors (see *Channel i Tx*

*descriptor tail pointer register (ETH_DMACiTXDTPR)* and *Channel 0 Rx descriptor tail pointer register (ETH_DMAC0RXDTPR)*).

7. Program ETH_DMAC0CR, ETH_DMAC0TXCR and ETH_DMAC0RXCR registers (see *Channel i control register (ETH_DMACiCR)* and *Channel i transmit control register (ETH_DMACiTXCR)*) to configure the parameters such as the maximum burst-length (PBL) initiated by the DMA, descriptor skip lengths, OSP for TxDMA, RBSZ for RxDMA.
8. Enable the interrupts by programming the ETH_DMAC0IER register (see *Channel i interrupt enable register (ETH_DMACiIER)*).
9. Start the Receive and Transmit DMAs by setting SR (bit 0) of *Channel 0 receive control register (ETH_DMAC0RXCR)* and ST (bit 0) of the ETH_DMAC0TXCR (see *Channel i transmit control register (ETH_DMACiTXCR)*).
10. Repeat steps 4 to 9 for all the Tx DMA channels selected in the hardware.

### 64.9.2 MTL initialization

Complete the following steps to initialize the MTL registers:

1. Program the Tx Scheduling (SCHALG) and Receive Arbitration Algorithm (RAA) fields in *Operating mode Register (ETH_MTLOMR)* to initialize the MTL operation when multiple Tx and Rx queues are used.
2. Program the following fields to initialize the operating mode in the ETH_MTLTXQiOMR (see *Tx queue i operating mode Register (ETH_MTLTXQiOMR)*).
   a) Transmit Store And Forward (TSF) or Transmit Threshold Control (TTC) if the Threshold mode is used.
   b) Transmit Queue Enable (TXQEN) to value 2‘b10 to enable Transmit Queue 0.
   c) Transmit Queue Size (TQS).
3. Program the following fields to initialize the operating mode in the ETH_MTLRXQiOMR register (see *Rx queue i operating mode register (ETH_MTLRXQiOMR)*):
   a) Receive Store and Forward (RSF) or RTC if Threshold mode is used.
   b) Flow Control Activation and De-activation thresholds for MTL Receive FIFO (RFA and RFD).
   c) Error Packet and undersized good Packet forwarding enable (FEP and FUP).
   d) Receive Queue Size (RQS).
4. Repeat the previous two steps for all the MTL Tx and Rx queues selected in the configuration

### 64.9.3 MAC initialization

The following MAC Initialization operations can be performed after DMA initialization. If the MAC initialization is complete before the DMA is configured, enable the MAC receiver (last step in the following sequence) only after the DMA is active. Otherwise, received frames fill the Rx FIFO and overflow.

1. Provide the MAC address registers: *Address x low register (ETH_MACAxLR)* and *Address 0 high register (ETH_MACA0HR)*. If more than one MAC address is enabled in your configuration (up to 3 additional addresses), program the MAC addresses appropriately.
2. Program the following fields to set the appropriate filters for the incoming frames in the *Packet filtering control register (ETH_MACPFR)*:

a) Receive All.
b) Promiscuous mode.
c) Hash or Perfect Filter.
d) Unicast, multicast, broadcast, and control frames filter settings.

3. Program the following fields for proper flow control in the *Tx Queue 0 flow control register (ETH_MACQ0TXFCR)*:
   a) Pause time and other Pause frame control bits.
   b) Transmit Flow control bits.
   c) Flow Control Busy.
4. Program the *Interrupt enable register (ETH_MACIER)* as required, if it is applicable for your configuration.
5. Program the appropriate fields in the *Operating mode configuration register (ETH_MACCR)* register.
   For example: Inter-packet gap while transmission and jabber disable.
6. Set bit 0 and 1 in *Operating mode configuration register (ETH_MACCR)* register to start the MAC transmitter and receiver.

### 64.9.4 Performing normal receive and transmit operation

For normal operation, complete the following steps:

1. For normal transmit and receive interrupts, read the interrupt status. Then, poll the descriptor by reading the status of the descriptor owned by the Host (either transmit or receive).
2. Set the descriptors to appropriate values. Make sure that transmit and receive descriptors are owned by the DMA to resume the transmission and reception of data.
3. If the descriptors are not owned by the DMA (or no descriptor is available), the DMA goes into Suspend state. The transmission or reception can be resumed by freeing the descriptors and writing the ETH_DMAC0TXDTPR (see *Channel i Tx descriptor tail pointer register (ETH_DMACiTXDTPR)* and ETH_DMAC0RXDTPR (see *Channel 0 Rx descriptor tail pointer register (ETH_DMAC0RXDTPR)*).
4. In debug mode, the values of the current host transmitter or receiver descriptor address pointer can be read in ETH_DMAC0CATXDR and ETH_DMAC0CARXDR registers (see *Channel i current application transmit descriptor register (ETH_DMACiCATXDR)* and *Channel 0 current application receive descriptor register (ETH_DMAC0CARXDR)*).
5. In debug mode, the values of the current host transmit buffer address pointer and receive buffer address pointer can be read in ETH_DMAC0CATXDR and ETH_DMAC0CARXDR registers (see *Channel i current application transmit descriptor register (ETH_DMACiCATXDR)* and *Channel 0 current application receive descriptor register (ETH_DMAC0CARXDR)*).

### 64.9.5 Stopping and starting transmission

Complete the following steps to pause the transmission for some time :

1. Disable the Transmit DMA (if applicable) by clearing Bit 0 (ST) of ETH_DMAC0TXCR register (see *Channel i transmit control register (ETH_DMACiTXCR)*).
2. Wait for any previous frame transmissions to complete. You can check this by reading the appropriate bits of ETH_MTLTXQ0DR register (TRCSTS is not 01 and TXQSTS=0).
3. Disable the MAC transmitter and MAC receiver by clearing Bit (RE) and Bit 1(TE) of the *Operating mode configuration register (ETH_MACCR)* Register.
4. Disable the Receive DMA (if applicable), after making sure that the data in the Rx FIFO is transferred to the system memory (by reading the appropriate bits of *Tx queue i debug Register (ETH_MTLTXQiDR)*, PRXQ=0 and RXQSTS=00).
5. Make sure that both Tx queue and Rx queue are empty (TXQSTS is 0 in *Tx queue i debug Register (ETH_MTLTXQiDR)* and RXQSTS is set to 0.
6. To restart the operation, first start the DMAs, and then enable the MAC Transmitter and Receiver.

### 64.9.6 Programming guidelines for multichannel multiqueue operation

#### Transmit path

1. Program the Transmit queue size in the TQS field in ETH_MTLTXQ**i**OMR register. The size of the queue is determined by the value programmed in the TQS field.

   During the Transmit operation, the number of channels is equal to the number of the queues. As a result, the channel to queue mapping is fixed.
2. To use a queue, the queue must be enabled by setting the TXQEN bit in the corresponding ETH_MTLTXQ**i**OMR register. In DMA configurations, the ST bit in *Channel i transmit control register (ETH_DMACiTXCR)* and the corresponding TXQEN bit in ETH_MTLTXQ**i**OMR register must be enabled.
3. Program the scheduling method in SCHALG bit of ETH_MTLOMR register.
4. If CBS algorithm is enabled on AV queue 1, ETH_MTLTXQ1ECR, ETH_MTLTXQ1SSCR**,** ETH_MTLTXQ1HCR and ETH_MTLTXQ1LCR registers also need to be programmed as required.

#### Receive path

1. Program the Receive queue size in the RQS field in ETH_MTLRXQiOMR register. The size of the queue is determined by the value programmed in the RQS field.
2. Enable the Receive queues 0 to 1 in the RXQ0EN to RXQ1EN fields of ETH_MACRXQ0CR register for AV.
3. The MAC routes the Rx packets to the Rx queues depending on following packet types:
   a) AV PTP packets are routed according to the value of AVPTPQ in ETH_MACRXQ1CR register
   b) AV untagged control packets are routed according to the value of AVCPQ in ETH_MACRXQ1CR register.
   c) VLAN tag priority field in VLAN tagged packets

      Program PSRQ1 and PSRQ0 of the ETH_MACRXQC2R register to configure the routing of tagged packets based on the USP (user priority) field of the received packets to the Rx queues 0 to 1.
   d) The AV tagged control and data packets are also routed according to PSRQ field of the ETH_MACRXQC2R register.

### 64.9.7 Programming guidelines for GMII link state transitions

#### Transmit and Receive clocks are running when the link is down

Complete the following steps when the link is down while the Transmit and Receive clocks are running:

1. Disable the Transmit DMA (if applicable) by clearing bit 0 (ST) of *Channel i control register (ETH_DMACiCR)*.
2. Disable the MAC receiver by clearing bit 2 (RE) of *Operating mode configuration register (ETH_MACCR)*.
3. Wait for any previous frame transmissions to complete. You can check this by reading the appropriate bits of *Tx queue i debug Register (ETH_MTLTXQiDR)* (TRCSTS is not 01).

   or

   Flush the Tx FIFO for faster empty operation.
4. Disable the MAC transmitter by clearing Bit 1(TE) of the *Operating mode configuration register (ETH_MACCR)* Register.
5. Make sure that both Tx and Rx queues are empty (TXQSTS is set to 0 in *Tx queue i debug Register (ETH_MTLTXQiDR)* and RXQSTS to 0 in *Rx queue i debug register (ETH_MTLRXQiDR)*).
6. After the link is up, read the PHY registers to identify the latest configuration and program the MAC registers accordingly.
7. Restart the operation by starting the Tx DMA. Then enable the MAC Transmitter and Receiver.

   The Rx DMA does not need to be enabled: since the Receiver is disabled, there are no data in the Rx FIFO.

#### Transmit and Receive clocks are stopped when the link is down

Complete the following steps when the link is down and the Transmit and Receive clocks are stopped :

1. Disable the MAC Transmitter and Receiver by clearing RE and TE bits in the *Operating mode configuration register (ETH_MACCR)*. This will not take immediate effect as the clocks are absent.
2. Wait till the link is up and the clocks are restored.
3. Wait until the transfer of any partial frame is complete if any was ongoing when the Transmit/Receive clock is stopped. This can be checked by reading the *Debug register (ETH_MACDR)* (all bits should be set to 0). Some old packets may still remain in the TXFIFO as the MAC Transmitter is stopped.
4. Read the PHY registers to identify the latest operating mode and program the MAC registers accordingly.
5. Restart the MAC Transmitter and Receiver by setting RE and TE bits.

### 64.9.8 Programming guidelines for IEEE 1588 timestamping

#### Initializing the System time generation

The timestamp feature can be enabled by setting bit 0 of the *Timestamp control Register (ETH_MACTSCR)*. However, it is essential that the timestamp counter is initialized after this bit is set. Complete the following steps to perform the peripheral initialization:

1. Mask the Timestamp Trigger interrupt by clearing bit 16 of *Interrupt enable register (ETH_MACIER)*.
2. Set bit 0 of *Timestamp control Register (ETH_MACTSCR)* to enable timestamping.
3. Program *Sub-second increment register (ETH_MACSSIR)* based on the PTP clock frequency.
4. If you use the Fine Correction method, program *Timestamp addend register (ETH_MACTSAR)* and set bit 5 of *Timestamp control Register (ETH_MACTSCR)*.
5. Poll the *Timestamp control Register (ETH_MACTSCR)* until bit 5 is cleared.
6. Program bit 1 of *Timestamp control Register (ETH_MACTSCR)* to select the Fine Update method (if required).
7. Program *System time seconds update register (ETH_MACSTSUR)* and *System time nanoseconds update register (ETH_MACSTNUR)* with the appropriate time value.
8. Set bit 2 in *Timestamp control Register (ETH_MACTSCR)*.

   The timestamp counter starts as soon as it is initialized with the value written in the Timestamp Update registers. If one-step timestamping is required:

   a) Enable one-step timestamping by programming bit 27 of the TDES3 Context Descriptor.

   b) Program *Timestamp Ingress asymmetric correction register (ETH_MACTSIACR)* to update the correction field in PDelay_Req PTP messages.
9. Enable the MAC receiver and transmitter for proper timestamping.

*Note: If timestamp operation is disabled by clearing bit 0 of Timestamp control Register (ETH_MACTSCR), repeat all these steps to restart the timestamp operation.*

### System time correction

To synchronize or update the system time in one shot (coarse correction method), complete the following steps:

1. Set the offset (positive or negative) in the Timestamp Update registers (*System time seconds update register (ETH_MACSTSUR)* and *System time nanoseconds update register (ETH_MACSTNUR)*).
2. Set bit 3 (TSUPDT) of the *Timestamp control Register (ETH_MACTSCR)*.

   The value in the Timestamp Update registers is added to or subtracted from the system time when the TSUPDT bit is cleared.

To synchronize or update the system time to reduce system-time jitter (fine correction method), complete the following steps:

1. With the help of the algorithm described in *Section : System time register module*, calculate at which rate you intend increment or decrement the system time.
2. Update the *Timestamp addend register (ETH_MACTSAR)* with the new value and set bit 5 of the *Timestamp control Register (ETH_MACTSCR)* Register.
3. Wait for the time during which you want the new value of the Addend register to be active. This can be done by enabling the Timestamp Trigger interrupt after the system time reaches the target value.
4. Program the required target time in *PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*.
5. Enable the Timestamp interrupt in bit 12 of *Interrupt enable register (ETH_MACIER)*.
6. Set bit 4 in Register *Timestamp control Register (ETH_MACTSCR)*.
7. When this trigger generates an interrupt, read *Interrupt status register (ETH_MACISR)*.
8. Reprogram *Timestamp addend register (ETH_MACTSAR)* with the old value and set bit 5 again.

## 64.9.9 Programming guidelines for AV feature

### Enabling slot number checking

You can use the slot number check feature to specify the intervals at which the DMA Channels mapped to AV queues fetches the frames from the AHB/AXI system bus. This feature is useful to ensure a uniform and periodic transfer of the AV traffic from the host memory. It is available only when timestamping is enabled and the *Sub-second increment register (ETH_MACSSIR)*. Complete the following steps to enable the slot number checking:

*Note: The slot number checking steps should be complete after programming the CBS control register, idleSlope, sendSlope, hiCredit, and loCredit registers of the AV queues (step 11 of Section 64.9.1: DMA initialization). and before starting the Receive and Transmit DMA (step 12 of inti).*

1. Enable timestamping by following the steps described in *Section : Initializing the System time generation*.
2. Make sure that the SLOTNUM field (bits 22 to 19) of TDES3 Normal Descriptor (Read Format) contains a valid slot number. To do this, read the current reference slot number from the ETH_DMAC0SFCSR register.
3. Set bit 0 (ESC) of ETH_DMAC0SFCSR to enable the slot number checking.

### Enabling average bits per slot reporting

The CBS Status register of the additional AV channels provides information about the average bits that are transmitted in a slot. The software can asynchronously read this register to retrieve information about the average bits transmitted per slot. Complete the following steps to enable average bits per slot reporting:

1. Enable timestamping by following the steps described in *Section : Initializing the System time generation*.
2. Program SLC bits of the ETH_MTLTXQ1ECR register of a channel with number of slots over which the average transmitted bits per slot need to be computed.
3. Enable ABPSSIE of the ETH_MTLQxICSR register of a channel to generate the average bits per slot interrupt.

*Note: The frequency of this interrupt depends on the value programmed during previous step. For example, when you program value 0 in the SLC field, the interrupt is generated at every 125 microsecond.*

*When it is not required, you can disable this interrupt to stop the interrupt flooding.*

4. Read ABS bits from ETH_MTLTXQxESR register of a channel on each interrupt.

   The software can read the ABS bits in polling mode even if the ABPSIE bit is not enabled. When high, bit 1 (ABPSIS) of ETH_MTLTXQxESR indicates that a new value is updated in the ABS field.

## 64.9.10 Programming guidelines for Energy Efficient Ethernet (EEE)

### Entering and exiting Tx LPI mode

Complete the following steps during MAC initialization:

1. Read the PHY register through the MDIO interface and check if the remote end has the EEE capability. Then negotiate the timer values.
2. Program the PHY registers through the MDIO interface (including the RX_CLK_stoppable bit that indicates to the PHY whether to stop Rx clock in LPI mode or not).
3. Program bits 25 to 16 and bits 1 to 0 in *LPI timers control register (ETH_MACLTCR)*.
4. Read the PHY link status by using the MDIO interface and update bit 17 of *LPI control status register (ETH_MACLCSR)*.
5. Update *LPI control status register (ETH_MACLCSR)* accordingly. This update should be done whenever the link status in the PHY chip changes.
6. Program *1-microsecond-tick counter register (ETH_MAC1USTCR)* as per the frequency of the clock used for accessing the CSR slave port.
7. Program the LPIET bit in the *LPI entry timer register (ETH_MACLETR)* with the IDLE time for which the MAC should wait before entering the LPI state on its own.
8. Set LPITE and LPITXA (bits 20 to 19) of *LPI control status register (ETH_MACLCSR)*.
9. Update *LPI control status register (ETH_MACLCSR)* to enable LPI auto-entry and MAC auto-exit from LPI state.
10. Program the *1-microsecond-tick counter register (ETH_MAC1USTCR)* according to the frequency of the clock used to access the CSR slave port.
11. Program the LPIET bit in *LPI entry timer register (ETH_MACLETR)* register with the IDLE time for which the MAC should wait before entering the LPI state on its own.

12. Set LPITE and LPITXA (bits 20 and 19) of *LPI control status register (ETH_MACLCSR)* to enable LPI auto-entry and MAC auto-exit from LPI state.
13. Set bit 16 of *LPI control status register (ETH_MACLCSR)* to put the MAC transmitter in LPI state.

    The MAC enters the LPI state when all scheduled packets are completed. It remains IDLE for the time indicated by LPIET bits. It sets the TLPIEN (bit 0) after entering LPI state.
14. When a packet transmission is scheduled (when the TxDMA exits IDLE state or when a packet is presented at ATI or MTI interface), the MAC Transmitter automatically exits LPI state. It waits for TWT time before setting the TLPIEX interrupt status bit and then resume the packet transmission.
15. The MAC Transmitter enters again LPI state if it remains IDLE for LPIET time. It then sets the TLPIEN bit and the entry-exit cycle continues.
16. Reset LPITXEN bit if the application needs to override the auto-entry/exit modes and directly exit the MAC Transmitter from LPI state.

### 64.9.11 Programming guidelines for flexible pulse-per-second (PPS) output

#### Generating a single pulse on PPS

To generate a single pulse on PPS:

1. Program TRGTMODSEL bit to 11 or 10 (for interrupt) in *PPS control register [alternate] (ETH_MACPPSCR)*. This instructs the MAC to use the Target Time registers (register 736 and 737) as start time of PPS signal output.
2. Program the start time value in the Target Time registers (register 736 and 737).
3. Program the width of the PPS signal output in *PPS width register (ETH_MACPPSWR)* Register.
4. Program PPSCMD of *PPS control register [alternate] (ETH_MACPPSCR)* to 0001. This instructs the MAC to generate a single pulse on the PPS signal output at the time programmed in the Target Time registers.

When the PPSCMD is executed (PPSCMD bits = 0), you can cancel the pulse generation by giving the Cancel Start Command (PPSCMD=0011) before the programmed start time has elapsed. You can also program the behavior of the next pulse in advance. To program the next pulse:

1. Program the start time for the next pulse in the Target Time registers. This time should be higher than the time at which the falling edge occurs for the previous pulse.
2. Program the width of the next PPS signal output in *PPS width register (ETH_MACPPSWR)*.
3. Program PPSCMD bits of *PPS control register [alternate] (ETH_MACPPSCR)* to generate a single pulse after the previous pulse is de-asserted. This instructs the MAC to generate a single pulse on the PPS signal output at the time programmed in Target Time registers.

   If this command is given before the previous pulse becomes low, then the new command overwrites the previous command and the QOS may generate only 1 extended pulse.

### Generating a pulse train on PPS

To generate a pulse train on PPS:

1. Program TRGTMODSEL bits to 11 or 10 (for interrupt) in *PPS control register [alternate] (ETH_MACPPSCR)*. This instructs the MAC to use the Target Time registers (register 736 and 737) for start time of the PPS signal output.
2. Program the start time value in the Target Time registers (register 736 and 737).
3. Program the interval value between the train of pulses on the PPS signal output in *PPS interval register (ETH_MACPPSIR)*.
4. Program the width of the PPS signal output in *PPS width register (ETH_MACPPSWR)*.
5. Program PPSCMD bits in *PPS control register [alternate] (ETH_MACPPSCR)* to 0010. This instructs the MAC to generate a train of pulses on the PPS signal output at the start time programmed in Target Time registers.

   By default, the PPS pulse train is free-running unless it is stopped by issuing a ‘STOP Pulse train at time’ or ‘STOP Pulse Train immediately’ commands.
6. Program the stop value in the Target Time registers. Ensure that TSTRBUSY bit in *PPS target time nanoseconds register (ETH_MACPPSTTNR)* is reset before programming the Target Time registers again.
7. Program the PPSCMD bits in *PPS control register [alternate] (ETH_MACPPSCR)* to 0100 to stop the train of pulses on PPS signal output after the programmed stop time specified at step 6 has elapsed.

The pulse train can be stopped at any time by programming 0101 in the PPSCMD field.

Similarly, the Stop Pulse train command (given in Step 5) can be canceled by programming PPSCMD bits to 0110 before the time (programmed at step 6) has elapsed.

The pulse train generation can be stopped by programming PPSCMD to 0011 before the start time programmed at step 2) has elapsed.

### Generating an interrupt without affecting the PPS

TRGTMODSEL bits in *PPS control register [alternate] (ETH_MACPPSCR)* enable you to program the Target Time registers (register 736 and 737) to do any one of the following:

- Generate only interrupts.
- Generate interrupts and the PPS start and stop time.
- Generate only PPS start and stop time.

To program the Target Time registers to generate only interrupt event:

1. Program TRGTMODSEL bits of *PPS control register [alternate] (ETH_MACPPSCR)* to 00 (for interrupt). This instructs the MAC to use the Target Time registers for target time interrupt.
2. Program a target time value in the Target Time registers. This instructs the MAC to generate an interrupt when the target time elapses.

   If TRGTMODSEL bits are changed (for example, to control the PPS), then the interrupt generation is overwritten with the new mode and new programmed Target Time register value.

## 64.9.12 Programming guidelines for TSO

Follow the steps below to program TSO:

1. Program TSE bit of the corresponding ETH_DMAC0TXCR register to enable TCP packet segmentation in that DMA.
2. In addition to the normal transfer descriptor setting, the following descriptor fields must be programmed to enable TSO for the current packet:
   a) Enable TSE of TDES3 (bit 18).
   b) Program the length of the unsegmented TCP/IP packet payload in bits 17 to 0 of TDES3, and the TCP header in bits 22 to 19 of TDES3.
   c) Program the maximum size of the segment in:
   – MSS of ETH_DMAC0CR
   – or MSS in the context descriptor

   If MSS field is programmed in both ETH_DMAC0CR and in the context descriptor, the latest software programmed sequence is considered.
3. The unsegmented TCP/IP packet header should be stored in Buffer 1 of the first descriptor. This buffer must not hold any payload bytes. The payload is allocated to Buffer 2 and the buffers of the subsequent descriptors.

**Caution:** If TSE is enabled in TDES3 for a non-TCP-IP packet, the result is unpredictable.

### 64.9.13 Programming guidelines to perform VLAN filtering on the receive

Follow the sequence below to perform VLAN filtering on the receiver:

1. Program *VLAN tag register (ETH_MACVTR)* for the following bit to select the filtering method:
   – ETV: Enable 12-bit VLAN Tag Comparison or 16-bit VLAN Tag comparison.
   – VTHM: VLAN Tag Hash Table Match Enable.
   – ERIVLT: Enable inner VLAN Tag or outer VLAN Tag (to enable the inner or outer VLAN Tag filtering, Double VLAN Processing should enabled by setting EDVLP)
   – ERSVLM: Enable Receive S-VLAN Match or C-VLAN match (for S-VLAN processing to be enabled, set ESVL)
   – DOVLTC: Ignores VLAN Type for Tag Match
   – VTIM: to enable VLAN Tag Inverse Match instead of the normal VLAN Tag matching
2. Program VL bit in *VLAN tag register (ETH_MACVTR)* for the 12-bit or 16-bit VLAN tag.
3. If VLAN tag Hash filtering is enabled, program *VLAN Hash table register (ETH_MACVHTR)*. The upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. For example, a Hash value of '1000 selects bit 8 of the VLAN Hash table.

## 64.10 Descriptors

### 64.10.1 Descriptor overview

In the Ethernet peripheral, the DMA transfers data based on a linked list of descriptors. The application creates the descriptors in the system memory (SRAM). The following two types of descriptors are supported:

- Normal descriptors

  The normal descriptors are used for packet data and to provide control information applicable to the packets to be transmitted.

- **Context descriptors**

  The context descriptors are used to provide control information applicable to the packet to be transmitted.

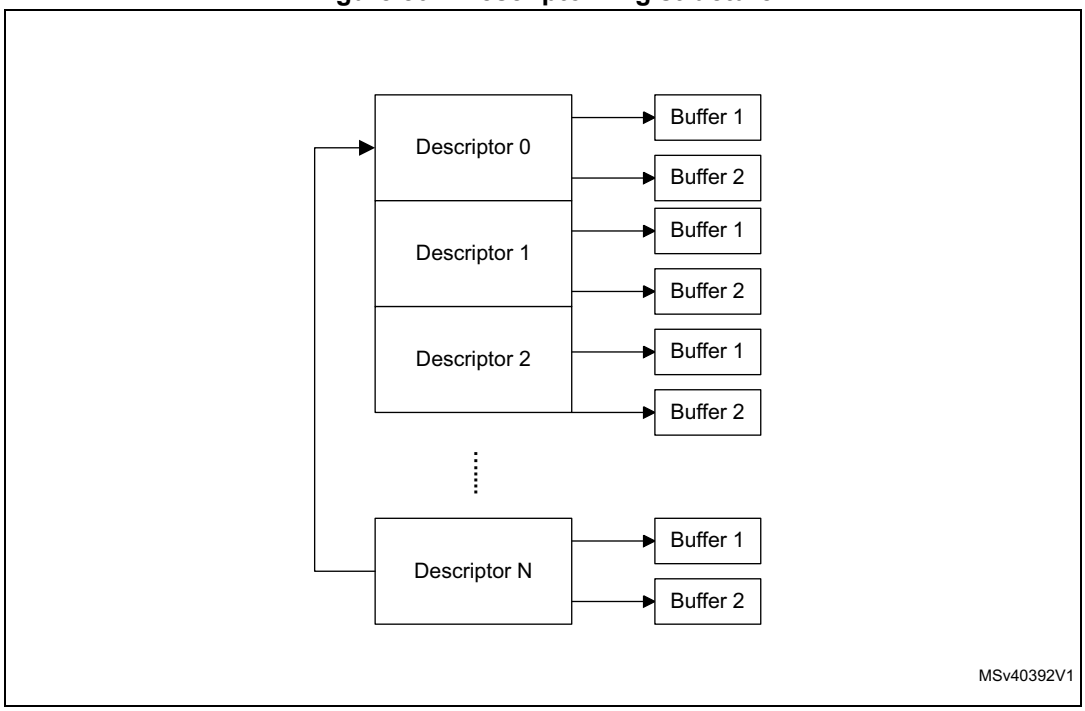
Each normal descriptor contains two buffers and two address pointers. These buffers enable the adapter port to be compatible with various types of memory management schemes.

There is no limit to the number of descriptors that can be used for a single packet.

### 64.10.2 Descriptor structure

The Ethernet peripheral supports the ring structure for DMA descriptors.

**Figure 802. Descriptor ring structure**



In a ring structure, descriptors are separated by the 64-bit word number programmed in the DSL field of the *Channel i control register (ETH_DMACiCR)*). The application needs to program the total ring length, that is the total number of descriptors in ring span, in the following registers of a DMA channel:

- *Channel i Tx descriptor ring length register (ETH_DMACiTXRLR)*)
- *Channel 0 Rx descriptor ring length register (ETH_DMAC0RXRLR)*)

The *Channel i Tx descriptor tail pointer register (ETH_DMACiTXDTPR)* or *Channel 0 Rx descriptor tail pointer register (ETH_DMAC0RXDTPR)* contains the pointer to the descriptor address (*N*). The base address and the current descriptor pointer decide the address of the current descriptor that the DMA can process. The descriptors up to one location less than the one indicated by the descriptor tail pointer (*N* – 1) are owned by the DMA. The DMA continues to process the descriptors until the following condition occurs:

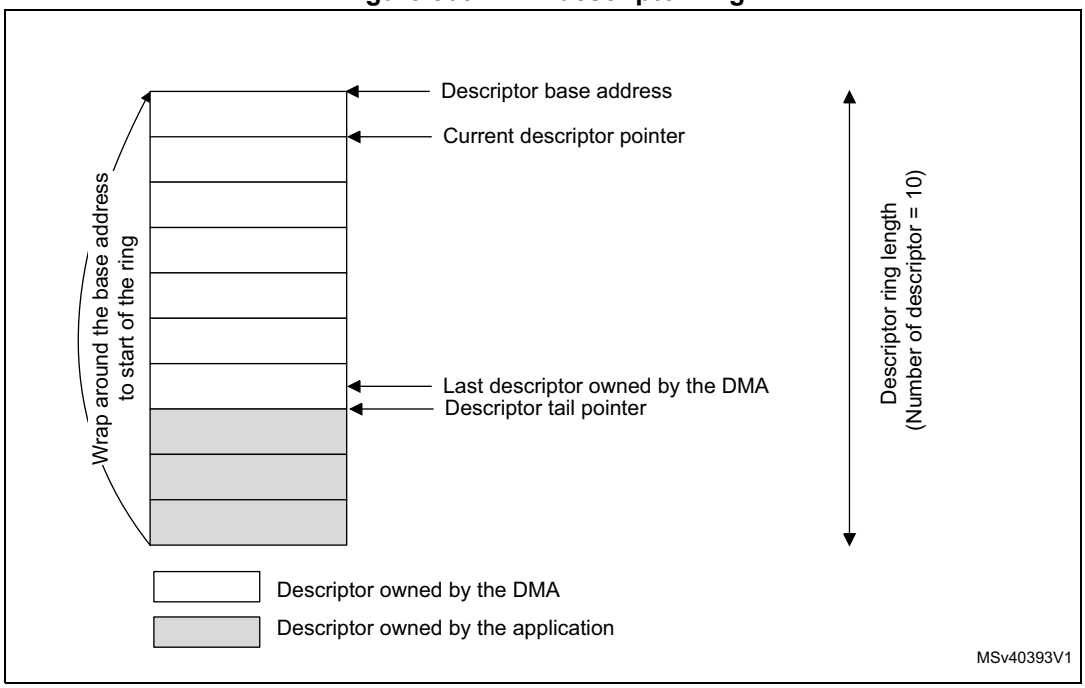
```
Current Descriptor Pointer == Descriptor Tail Pointer;
```

The DMA enters the Suspend state when this condition occurs. The application must perform a write operation to the Descriptor tail pointer register and update the tail pointer so that the following condition is met:

```
Current Descriptor Pointer < Descriptor Tail Pointer;
```

The DMA automatically wraps around the base address when the end of ring is reached, as shown in *Figure 803: DMA descriptor ring*.

**Figure 803. DMA descriptor ring**



For descriptors owned by the application, the OWN bit of DES3 is reset to 0.

For descriptors owned by the DMA, the OWN bit is set to 1.

At the beginning, if the application has only one descriptor, it sets the last descriptor address (tail pointer) to Descriptor Base Address + 1. The DMA then processes the first descriptor and waits for the application to increment the tail pointer.

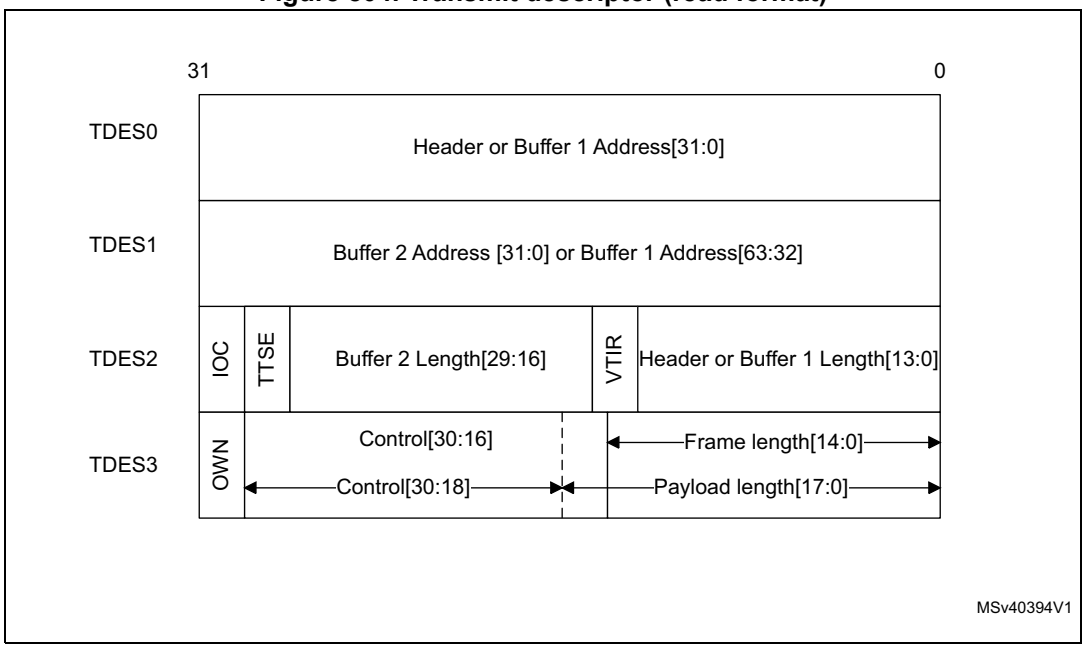
### 64.10.3 Transmit descriptor

The Ethernet peripheral DMA requires at least one descriptor for a transmit packet. In addition to two buffers, two byte-count buffers, and two address pointers, the transmit descriptor features control fields which can be used to manage the MAC operation on per-transmit packet basis. The Transmit normal descriptor has the following two formats: Read format and Write-back format

#### Transmit normal descriptor (read format)

*Figure 804* shows the Read format for Transmit normal descriptor. *Table 501* to *Table 504* provide a detailed description of all Transmit normal descriptors (read format).

**Figure 804. Transmit descriptor (read format)**



- TDES0 normal descriptor (read format)

**Table 501. TDES0 normal descriptor (read format)**

| Bit | Name | Description |
|---|---|---|
| 31:0 | BUF1AP | **Buffer 1 Address Pointer or TSO Header Address Pointer**<br>These bits indicate either the physical address of Buffer 1 or the TSO Header Address pointer when the following bits are set:<br>– TSE bit of TDES3<br>– FD bit of TDES3 |

- TDES1 normal descriptor (read format)

**Table 502. TDES1 normal descriptor (read format)**

| Bit | Name | Description |
|---|---|---|
| 31:0 | BUF2AP | **Buffer 2 or Buffer 1 Address Pointer:**<br>These bits indicate the physical address of Buffer 2 when a descriptor ring structure is used. There is no limitation to the buffer address alignment. |

- TDES2 normal descriptor (read format)

| 31 | 30 | 29:16 | 15:14 | 13:0 |
|---|---|---|---|---|
| IOC | TTSE | B2L | VTIR | HL or B1L |

**Table 503. TDES2 normal descriptor (read format)**

| Bits | Name | Description |
|---|---|---|
| 31 | IOC | **Interrupt on Completion:**<br>This bit sets the TI bit in the *Channel i status register (ETH_DMACiSR)*) when the present packet transmission is complete. |
| 30 | TTSE | **Transmit Timestamp Enable** |
| 29:16 | B2L | **Buffer 2 Length**<br>The driver sets this field. When set, this field indicates Buffer 2 length. |
| 15:14 | VTIR | **VLAN Tag Insertion or Replacement:**<br>These bits request the MAC to perform VLAN tagging or untagging before transmitting the packets. The application must set the CRC Pad Control bits appropriately when VLAN tag insertion, replacement, or deletion is enabled for the packet. The values of these bits are as follows:<br>– 00: Do not add a VLAN tag.<br>– 01: Remove the VLAN tag from the packets before transmission. This option should be used only with the VLAN packets.<br>– 10: Insert a VLAN tag with the tag value programmed in the *VLAN inclusion register (ETH_MACVIR)* or context descriptor.<br>– 11: Replace the VLAN tag in packets with the tag value programmed in the *VLAN inclusion register (ETH_MACVIR)* or context descriptor. This option should be used only with the VLAN packets. |
| 13:0 | HL or B1L | **Header Length or Buffer 1 Length**<br>For Header length, only bits [9:0] are taken into account. Bits 13 to 0 are applicable only to buffer 1 length.<br>If the TCP Segmentation Offload feature is enabled through the TSE bit of TDES3, this field is equal to the header length. When the TSE bit is set in TDES3, the header length includes the length (expressed in bytes)<br>from Ethernet Source address till the end of the TCP header. The maximum header length supported for TSO feature is 1023 bytes. The maximum header length supported for TSO feature is 1023 bytes.<br>If the TCP Segmentation Offload feature is not enabled, this field is equal to Buffer 1 length. |

- TDES3 normal descriptor (read format)

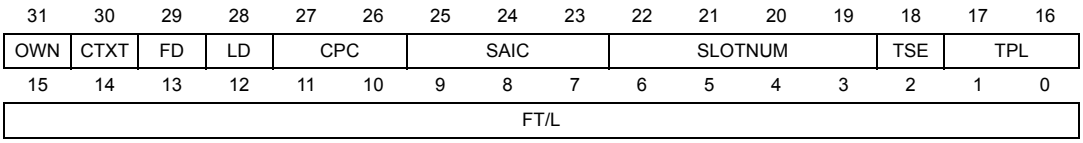


**Table 504. TDES3 normal descriptor (Read format)**

| Bits | Name | Description |
|---|---|---|
| 31 | OWN | **Own bit**<br>– 1: the DMA owns the descriptor.<br>– 0: the application owns the descriptor.<br>The DMA clears this bit after it completes the transfer of data given in the associated buffer(s). |
| 30 | CTXT | **Context Type**<br>This bit should be set to 0 for normal descriptor. |
| 29 | FD | **First Descriptor**<br>When this bit is set, it indicates that the buffer contains the first segment of a packet. |
| 28 | LD | **Last Descriptor**<br>When this bit is set, it indicates that the buffer contains the last segment of the packet. B1L or B2L field should have a non-zero value. |
| 27:26 | CPC | **CRC Pad Control**<br>This field controls the CRC and Pad Insertion for Tx packet. It is valid only when the first descriptor bit (TDES3[29]) is set. The values of bits[27:26] are the following:<br>– 00: CRC and Pad Insertion<br>The MAC appends the cyclic redundancy check (CRC) at the end of the transmitted packets whose length greater than or equal to 60 bytes. The MAC automatically appends padding and CRC to a packet with length less than 60 bytes.<br>– 01: CRC Insertion (Disable Pad Insertion)<br>The MAC appends the CRC at the end of the transmitted packet but it does not append padding. The application should ensure that the padding bytes are present in the packet being transferred from the Transmit buffer, that is, the packet being transferred from the Transmit Buffer is of length greater than or equal to 60 bytes.<br>– 10: Disable CRC Insertion<br>The MAC does not append the CRC at the end of the transmitted packet. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer.<br>– 11: CRC Replacement<br>The MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer.<br>*Note: When the TSE bit is set, the MAC ignores this field because the CRC and pad insertion is always done for segmentation.* |

**Table 504. TDES3 normal descriptor (Read format) (continued)**

| Bits | Name | Description |
|---|---|---|
| 25:23 | SAIC | **SA Insertion Control**<br>These bits request the MAC to add or replace the Source Address field in the Ethernet packet with the value given in the MAC Address 0 register. The application must appropriately set the CRC Pad Control bits when SA Insertion Control is enabled for the packet.<br>Bit 25 specifies the MAC Address Register (1 or 0) value that is used for Source Address insertion or replacement.<br>The following list describes the values of Bits[24:23]:<br>– 00: Do not include the source address<br>– 01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses.<br>– 10: Replace the source address. For reliable transmission, the application must provide frames with source addresses.<br>– 11: Reserved<br>These bits are valid when the First Segment control bit (TDES3 [29]) is set. |
| 22:19 | SLOTNUM | **SLOTNUM**: Slot Number Control Bits in AV mode<br>These bits indicate the slot interval in which the data should be fetched from the corresponding buffers addressed by TDES0 or TDES1.<br>When the Transmit descriptor is fetched, the DMA compares the slot number value in this field with the slot interval maintained in the RSN field of *Channel i slot function control status register (ETH_DMACiSFCSR)*. It fetches the data from the buffers only if a value matches. These bits are valid only for the AV channels. |
| 18 | TSE | **TCP Segmentation Enable**<br>When this bit is set, the DMA performs the TCP segmentation for a packet. This bit is valid only if the FD bit is set. |
| 17:16 | CIC/TPL | **Checksum Insertion Control or TCP Payload Length**<br>These bits control the checksum calculation and insertion. They can take the following values:<br>– 00: Checksum insertion disabled.<br>– 01: Only IP header checksum calculation and insertion are enabled.<br>– 10: IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware.<br>– 11: IP header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware.<br>This field is valid when the TSE bit is reset.When the TSE bit is set, it contains the upper bits [17:16] of the TCP Payload length. This allows the TCP packet length field to be spanned across TDES3[17:0] to provide 256 Kbyte packet length support. |

**Table 504. TDES3 normal descriptor (Read format) (continued)**

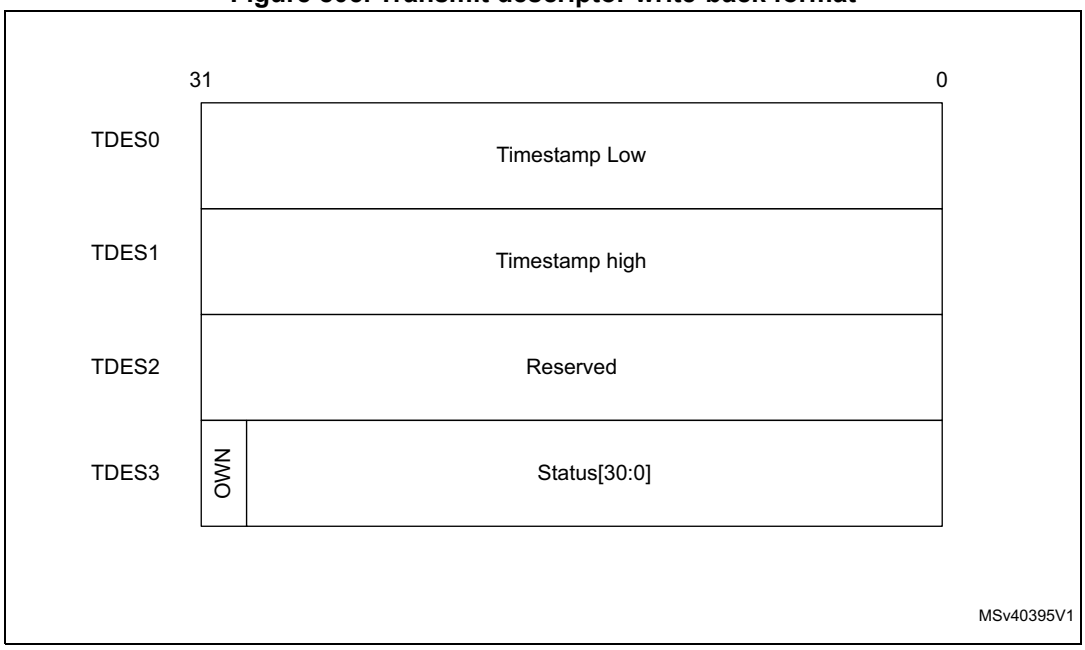
| Bits | Name | Description |
|---|---|---|
| 15 | TPL | **Reserved or TCP Payload Length**<br>When the TSE bit is reset, this bit is reserved. When the TSE bit is set, this is bit 15 of the TCP payload length [17:0]. |
| 14:0 | FL/TPL | **Packet Length or TCP Payload Length**<br>This field is equal to the length of the packet to be transmitted (expressed in bytes). When the TSE bit is not set, this field is equal to the total length of the packet to be transmitted:<br>Ethernet Header Length + TCP /IP Header Length – Preamble Length – SFD Length + Ethernet Payload Length<br>When the TSE bit is set, this field is equal to the lower 15 bits of the TCP payload length. This length does not include Ethernet header or TCP/IP header length. |

### Transmit normal descriptor (write-back format)

The write-back format is applicable only for the last descriptor of the corresponding packet. The LD bit (TDES3[28]) is set in the descriptor where the DMA writes back the status and timestamp information for the corresponding Transmit packet.

*Figure 805* shows the write-back format for Transmit normal descriptors. *Table 505* to *Table 508* provide a detailed description of all Transmit Normal descriptors (Write-Back Format).

**Figure 805. Transmit descriptor write-back format**



- TDES0 normal descriptor (write-back format)

**Table 505. DES0 normal descriptor (write-back format)(1)**

| Bit | Name | Description |
|---|---|---|
| 31:0 | TTSL | **Transmit Packet Timestamp Low**<br>The DMA updates this field with least significant 32 bits of the timestamp captured for the corresponding Transmit packet. The DMA writes the timestamp only if TTSE bit of TDES2 is set in the first descriptor of the packet. This field holds the timestamp only if the Last Segment bit (LS) in the descriptor is set and the Timestamp status (TTSS) bit is set. |

1. This format is only applicable to the last descriptor of a packet.

- TDES1 normal descriptor (write-back format)

**Table 506. TDES1 normal descriptor (write-back format)(1)**

| Bit | Name | Description |
|---|---|---|
| 31:0 | TTSH | **Transmit Packet Timestamp High**<br>The DMA updates this field with the most significant 32 bits of the timestamp captured for corresponding Receive packet. The DMA writes the timestamp only if the TTSE bit of TDES2 is set in the first descriptor of the packet. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and Timestamp status (TTSS) bit is set. |

1. This format is only applicable to the last descriptor of a packet.

- TDES2 normal descriptor (write-back format)

**Table 507. TDES2 normal descriptor (write-back format)(1)**

| Bit | Description |
|---|---|
| 31:0 | Reserved |

1. This format is only applicable to the last descriptor of a packet.

- TDES3 normal descriptor (write-back format)

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| OWN | CTXT | FD | LD | Reserved | | | | | | | | | | TTSS | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ES | JT | FF | PCE | LoC | NC | LC | EC | CC | | | | ED | UF | DB | IHE |

**Table 508. TDES3 normal descriptor (write-back format)(1)**

| Bit | Name | Description |
|---|---|---|
| 31 | OWN | **Own bit**<br>When this bit is set, it indicates that the DMA owns the descriptor. The DMA clears this bit when it completes the packet transmission. After the write-back is complete, this bit is set to 0. |
| 30 | CTXT | **Context Type**<br>This bit should be set to 0 for normal descriptors. |

**Table 508. TDES3 normal descriptor (write-back format)(1) (continued)**

| Bit | Name | Description |
|---|---|---|
| 29 | FD | **First Descriptor**<br>This bit indicates that the buffer contains the first segment of a packet. |
| 28 | LD | **Last Descriptor**<br>This bit is set 1 for last descriptor of a packet. The DMA writes the status fields only in the last descriptor of the packet. |
| 27:18 | Reserved | |
| 17 | TTSS | **Tx Timestamp Status**<br>This status bit indicates that a timestamp has been captured for the corresponding transmit packet. When this bit is set, TDES2 and TDES3 have timestamp values that were captured for the Transmit packet. This field is valid only when the Last Segment control bit (TDES3 [28]) in a descriptor is set. |
| 16 | Reserved | |
| 15 | ES | **Error Summary:**<br>This bit indicates the logical OR of the following bits:<br>– TDES3[0]: IP Header Error<br>– TDES3[14]: Jabber Timeout<br>– TDES3[13]: Packet Flush<br>– TDES3[12]: Payload Checksum Error<br>– TDES3[11]: Loss of Carrier<br>– TDES3[10]: No Carrier<br>– TDES3[9]: Late Collision<br>– TDES3[8]: Excessive Collision<br>– TDES3[3]: Excessive Deferral<br>– TDES3[2]: Underflow Error |
| 14 | JT | **Jabber Timeout**<br>This bit indicates that the MAC transmitter has experienced a jabber timeout. This bit is set only when the JD bit of the *Operating mode configuration register (ETH_MACCR)* is not set. |
| 13 | FF | **Packet Flushed**<br>This bit indicates that the DMA or MTL flushed the packet because of a software flush command given by the CPU. |
| 12 | PCE | **Payload Checksum Error**<br>This bit indicates that the Checksum Offload engine had a failure and did not insert any checksum into the encapsulated TCP, UDP, or ICMP payload. This failure can be either caused by insufficient bytes, as indicated by the Payload Length field of the IP Header, or by the MTL starting to forward the packet to the MAC transmitter in Store-and-Forward mode without the checksum having been calculated yet. This second error condition only occurs when the Transmit FIFO depth is less than the length of the Ethernet packet being transmitted to avoid deadlock, the MTL starts forwarding the packet when the FIFO is full, even in the store-and-forward mode. |

**Table 508. TDES3 normal descriptor (write-back format)(1) (continued)**

| Bit | Name | Description |
|---|---|---|
| 11 | LoC | **Loss of Carrier**<br>This bit indicates that Loss of Carrier occurred during packet transmission (that is, the ETH_CRS signal was inactive for one or more transmit clock periods during packet transmission). This is valid only for the packets transmitted without collision and when the MAC operates in the half-duplex mode. |
| 10 | NC | **No Carrier**<br>This bit indicates that the carrier sense signal form the PHY was not asserted during transmission. |
| 9 | LC | **Late Collision**<br>This bit indicates that packet transmission was aborted because a collision occurred after the collision window (64 byte times including Preamble. This bit is not valid if Underflow Error is set. |
| 8 | EC | **Excessive Collision**<br>This bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the *Operating mode configuration register (ETH_MACCR)*, this bit is set after first collision and the transmission of the packet is aborted. |
| 7:4 | CC | **Collision Count**<br>This 4-bit counter value indicates the number of collisions occurred before the packet was transmitted. The count is not valid when the EC bit is set. |
| 3 | ED | **Excessive Deferral**<br>This bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 bits times in 1000 Mbps mode or Jumbo Packet enabled mode) if DC bit is set in the *Operating mode configuration register (ETH_MACCR)*. |
| 2 | UF | **Underflow Error**<br>This bit indicates that the MAC aborted the packet because the data arrived late from the system memory. The underflow error can occur because of either of the following conditions:<br>– The DMA encountered an empty Transmit Buffer while transmitting the packet<br>– The application filled the MTL Tx FIFO slower than the MAC transmit rate<br>The transmission process enters the Suspend state and sets the underflow bit corresponding to a queue in the ETH_MTLISR register. |

**Table 508. TDES3 normal descriptor (write-back format)(1) (continued)**

| Bit | Name | Description |
|---|---|---|
| 1 | DB | **Deferred Bit**<br>This bit indicates that the MAC deferred before transmitting because of presence of carrier. This bit is valid only in the half-duplex mode. |
| 0 | IHE | **IP Header Error**<br>When IP Header Error is set, this bit indicates that the Checksum Offload engine detected an IP header error. This bit is valid only when Tx Checksum Offload is enabled. Otherwise, it is reserved. If COE detects an IP header error, it still inserts an IPv4 header checksum if the Ethernet Type field indicates an IPv4 payload. |

1. This format is only applicable to the last descriptor of a packet.

### Transmit context descriptor

The Transmit context descriptor can be provided any time before a packet descriptor. The context is valid for the current packet and subsequent packets. The context descriptor is used to provide the timestamps for one-step timestamp correction, VLAN Tag ID for VLAN insertion feature, and SA insertion bit for SA insertion. Write-back is only done on a context descriptor to reset the OWN bit.

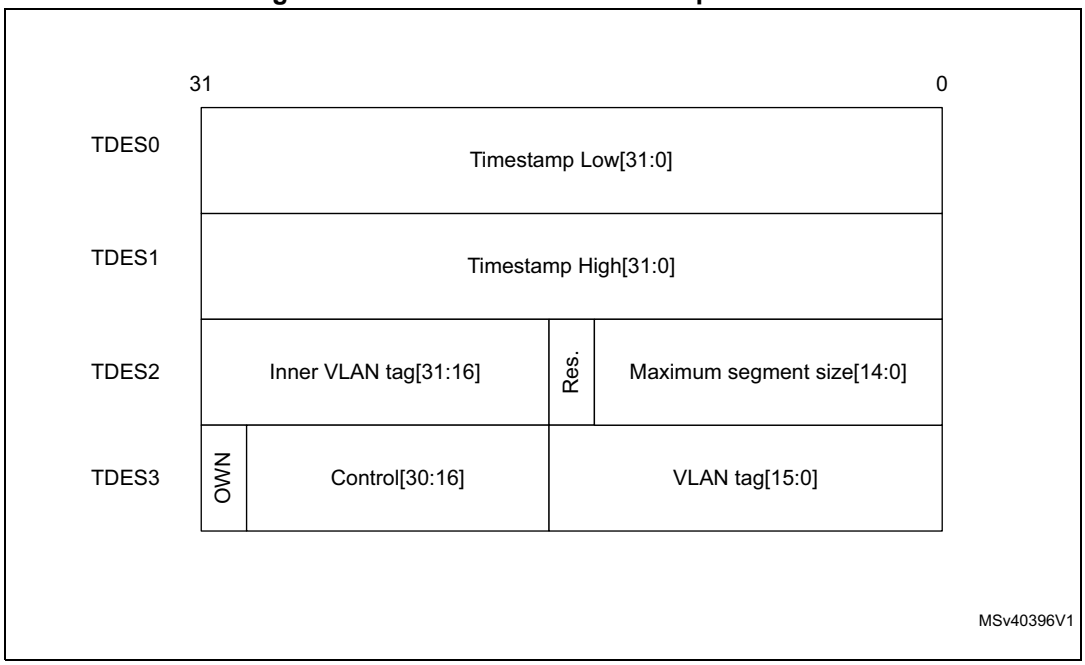
*Note: The VLAN tag IDs and MSS values, which are provided by the application in a context descriptor with their corresponding Valid bits set, are stored internally by the DMA.*

*When the outer or inner VLAN tag is provided with the Valid bit set, the DMA always passes the last valid VLAN tag to the MTL. The application cannot invalidate the valid VLAN tag stored by the DMA. The VLAN tag is inserted or replaced based on the control inputs provided for the packet.*

*The Inner VLAN Tag Control input is used only for the packet that immediately follows the context descriptor. The application must provide a context descriptor before the normal descriptor of each packet for which the DMA should use the inner VLAN Tag control input.*

*Figure 806* shows the format for Transmit context descriptors. *Table 509* to *Table 512* provide a detailed description of all Transmit context descriptors.

**Figure 806. Transmit context descriptor format**



- TDES0 context descriptor (read format)

**Table 509. TDES0 context descriptor**

| Bit | Name | Description |
|---|---|---|
| 31:0 | TTSL | **Transmit Packet Timestamp Low**<br>For one-step correction, the driver can provide the lower 32 bits of timestamp in this descriptor word. The DMA uses this value as the low word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set. |

- TDES1 context descriptor (read format)

**Table 510. TDES1 context descriptor**

| Bit | Name | Description |
|---|---|---|
| 31:0 | TTSH | **Transmit Packet Timestamp High**<br>For one-step correction, the driver can provide the upper 32 bits of timestamp in this descriptor. The DMA uses this value as the high word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set. |

- TDES2 context descriptor (read format)

**Table 511. TDES2 context descriptor**

| Bit | Name | Description |
|---|---|---|
| 31:16 | IVT | **Inner VLAN Tag**<br>When the IVLTV bit of TDES3 context descriptor is set and the TCMSSV and OSTC bits of TDES3 context descriptor are reset, TDES2[31:16] contains the inner VLAN Tag to be inserted in the subsequent Transmit packets. |
| 15:14 | Reserved | |
| 13:0 | MSS | **Maximum Segment Size**<br>This segment size is used while segmenting the TCP/IP payload. This field is valid only if the TCMSSV bit of TDES3 context descriptor is set and the OSTC bit of the TDES3 context descriptor is reset. |

- TDES3 context descriptor (read format)

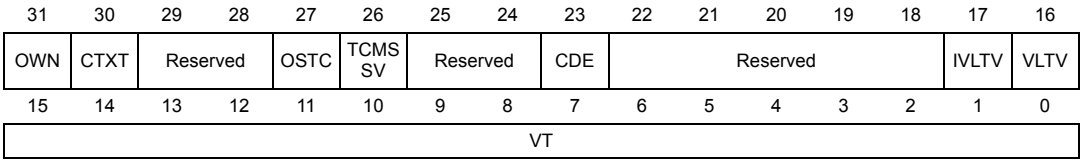


**Table 512. TDES3 context descriptor**

| Bit | Name | Description |
|---|---|---|
| 31 | OWN | **Own bit**<br>– 1: the DMA owns the descriptor.<br>– 0: the application owns the descriptor.<br>The DMA clears this bit when either of the following conditions is true:<br>– The DMA completes the packet reception.<br>– The buffers associated with the descriptor are full. |
| 30 | CTXT | **Context Type**<br>This bit should be set to 1 for context descriptor. |
| 29:28 | Reserved | |
| 27 | OSTC | **One-Step Timestamp Correction Enable**<br>When this bit is set, the DMA performs a one-step timestamp correction with reference to the timestamp values provided in TDES0 and TDES1. |
| 26 | TCMSSV | **One-Step Timestamp Correction Input or MSS Valid**<br>When this bit and the OSTC bit are set, it indicates that the Timestamp Correction input provided in TDES0 and TDES1 is valid.<br>When the OSTC bit is reset and this bit and the TSE bit of TDES3 are set in subsequent normal descriptor, it indicates that the MSS input in TDES2 is valid. |
| 25:24 | Reserved | |
| 23 | CDE | **Context Descriptor Error**<br>When this bit is set, it indicates that the context descriptor was provided in the incorrect sequence and the DMA ignored it. The DMA sets this bit during write-back while closing the context descriptor. |

**Table 512. TDES3 context descriptor (continued)**

| Bit | Name | Description |
|---|---|---|
| 22:20 | Reserved | |
| 19:18 | IVTIR | **Inner VLAN Tag Insert or Replace**<br>When these bits are set, they request the MAC to perform Inner VLAN tagging or untagging before transmitting the packets. If the packet is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes.<br>This bitfield has the following values:<br>– 00: Do not add the inner VLAN tag.<br>– 01: Remove the inner VLAN tag from the packets before transmission. This option should be used only with the VLAN frames.<br>– 10: Insert an inner VLAN tag with the tag value programmed in the *Inner VLAN inclusion register (ETH_MACIVIR)* or context descriptor.<br>– 11: Replace the inner VLAN tag in packets with the tag value programmed in the *Inner VLAN inclusion register (ETH_MACIVIR)* or context descriptor. This option should be used only with the VLAN frames. |
| 17 | IVLTV | **Inner VLAN Tag Valid**<br>When this bit is set, it indicates that the IVT field of TDES2 is valid. |
| 16 | VLTV | **VLAN Tag Valid**<br>When this bit is set, it indicates that the VT field of TDES3 is valid. |
| 15:0 | VT | **VLAN Tag**<br>This field contains the VLAN Tag to be inserted or replaced in the packet. This field is used as VLAN Tag only when the VLTI bit of the *VLAN inclusion register (ETH_MACVIR)* is reset. |

### 64.10.4 Receive descriptor

The DMA in the Ethernet peripheral attempts to read a descriptor only if the Tail pointer is different from the Base pointer or current pointer. It is recommended to have a descriptor ring with a length that can accommodate at least two complete packets received by the MAC; otherwise, the performance of the DMA is greatly impacted because of the unavailability of the descriptors. In such a situation, the MTL RxFIFO becomes full and starts dropping packets.

The following Receive descriptors are present:

- Normal descriptors with read and write-back formats
- Context descriptors

All received descriptors are prepared by the software and given to the DMA as “normal” descriptors (see *Figure 807: Receive normal descriptor (read format)* for a description of their content). The DMA reads this descriptor and, after transferring a received packet (or part of it) to the buffers indicated by the descriptor, the Rx DMA closes the descriptor with the corresponding packet status. The status format is given in *Figure 808: Receive normal descriptor (write-back format)*.

For some packets, the normal descriptor bits are not sufficient to write the complete status. For such packets, the Rx DMA will write the extended status to the next descriptor (without processing or using the Buffers pointers embedded in that descriptor). The format and content of this write-back descriptor is described in *Figure 809: Receive context descriptor*.

#### Receive normal descriptor (read format)

*Figure 807* shows the read format for Receive normal descriptors. *Table 513* to *Table 516* provide a detailed description of all Receive normal descriptors (read format).

**Figure 807. Receive normal descriptor (read format)**

*Note: In the Receive descriptor (read format), if the Buffer Address field contains only 0s, the MAC does not transfer data to this buffer and skips to the next buffer or next descriptor.*

- RDES0 normal descriptor (read format)

**Table 513. RDES0 normal descriptor (read format)**

| Bit | Name | Description |
|---|---|---|
| 31:0 | BUF1AP | **Header or Buffer 1 Address Pointer**<br>The application can program a byte-aligned address for this buffer, which means that the LS bits of this field can be non-zero. However, while transferring the start of packet, the DMA performs a write operation with RDES0[1:0] (or RDES0[2:0]/[3:0] in case of 64-/128-bit configuration) as zero. However, the packet data is shifted by the actual offset as given in the buffer address pointer.<br>If the address pointer points to a buffer where the middle or last part of the packet is stored, the DMA ignores the offset address and writes to the full location as indicated by the data-width. |

- RDES1 normal descriptor (read format)

**Table 514. RDES1 normal descriptor (read format)**

| Bit | Name | Description |
|---|---|---|
| 31:0 | Reserved | Field reserved. |

- RDES2 normal descriptor (read format)

**Table 515. RDES2 normal descriptor (read format)**

| Bit | Name | Description |
|---|---|---|
| 31:0 | BUF2AP | **Buffer 2 Address Pointer**<br>These bits indicate Buffer 2 physical address.<br>The RxDMA uses the LS bits of the pointer address only while transferring the start bytes of a packet. If the BUF2AP is giving the address of a buffer in which the middle or last part of a packet is stored, the DMA ignores RDES2[2:0]=0 and writes to the complete location. |

- RDES3 normal descriptor (read format)

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| OWN | IOC | Reserved | | | | BUF2V | BUF1V | Reserved | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Reserved | | | | | | | | | | | | | | | |

**Table 516. RDES3 normal descriptor (read format)**

| Bit | Name | Description |
|---|---|---|
| 31 | OWN | **Own bit**<br>When this bit is set, it indicates that the DMA owns the descriptor. When this bit is reset, it indicates that the application owns the descriptor. The DMA clears this bit when either of the following conditions is true:<br>– The DMA completes the packet reception<br>– The buffers associated with the descriptor are full |
| 30 | IOC | **Interrupt Enabled on Completion**<br>When this bit is set, an interrupt is issued to the application when the DMA closes this descriptor. |
| 29:26 | Reserved | |
| 25 | BUF2V | **Buffer 2 Address Valid**<br>When this bit is set, it indicates to the DMA that the buffer 1 address specified in RDES0 is valid. The application must set this bit so that the DMA can use the address to which the Buffer 2 address in RDES0 is pointing, to write received packet data. |

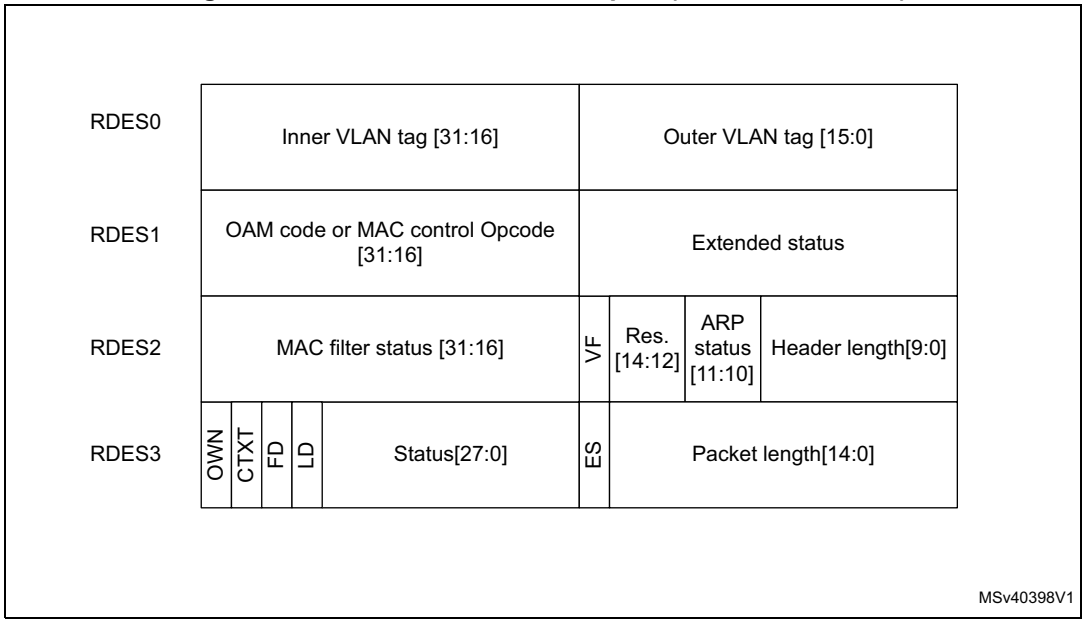
**Table 516. RDES3 normal descriptor (read format)**

| | | |
|---|---|---|
| 24 | BUF1V | **Buffer 1 Address Valid**<br>When set, this indicates to the DMA that the buffer 1 address specified in RDES1 is valid.<br>The application must set this value if the address to which Buffer 1 address points in RDES1, can be used by the DMA to write received packet data. |
| 23:0 | Reserved | |

## Receive normal descriptor (write-back format)

*Figure 808* shows the write-back format for Receive normal descriptors. *Table 517* to *Table 520* provide a detailed description of all Receive normal descriptors (write-back format).

**Figure 808. Receive normal descriptor (write-back format)**



- RDES0 normal descriptor (write-back format)

**Table 517. RDES0 normal descriptor (write-back format)**

| Bit | Name | Description |
|---|---|---|
| 31:16 | IVT | **Inner VLAN Tag**<br>This field contains the Inner VLAN tag of the received packet if the RS0V bit of RDES3 is set. |
| 15:0 | OVT | **Outer VLAN Tag**<br>This field contains the Outer VLAN tag of the received packet if the RS0V bit of RDES3 is set. |

- RDES1 normal descriptor (write-back format)

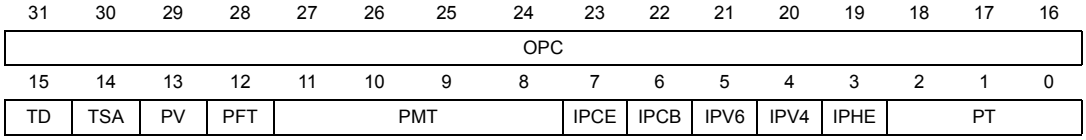


**Table 518. RDES1 normal descriptor (write-back format)(1)**

| Bit | Name | Description |
|---|---|---|
| 31:16 | OPC | **OAM Sub-Type Code, or MAC Control Packet opcode**<br>OAM Sub-Type Code<br>If bits[18:16] of RDES3 are set to 111, this field contains the OAM sub-type and code fields.<br>MAC Control Packet opcode<br>If bits[18:16] of RDES3 are set to 110, this field contains the MAC Control packet opcode field. |
| 15 | TD | **Timestamp Dropped**<br>This bit indicates that the timestamp was captured for this packet but got dropped in the MTL Rx FIFO because of overflow. |
| 14 | TSA | **Timestamp Available**<br>When Timestamp is present, this bit indicates that the timestamp value is available in a context descriptor word 2 (RDES2) and word 1(RDES1). This is valid only when the Last Descriptor bit (RDES3 [28]) is set.<br>The context descriptor is written in the next descriptor just after the last normal descriptor for a packet. |
| 13 | PV | **PTP Version**<br>1: Received PTP message in IEEE 1588 version 2 format<br>0: Received PTP message in IEEE 1588 version 1 format |
| 12 | PFT | **PTP Packet Type**<br>This bit indicates that the PTP message is sent directly over Ethernet. |
| 11:8 | PMT | **PTP Message Type**<br>These bits are encoded to give the type of the message received:<br>– 0000: No PTP message received<br>– 0001: SYNC (all clock types)<br>– 0010: Follow_Up (all clock types)<br>– 0011: Delay_Req (all clock types)<br>– 0100: Delay_Resp (all clock types)<br>– 0101: Pdelay_Req (in peer-to-peer transparent clock)<br>– 0110: Pdelay_Resp (in peer-to-peer transparent clock)<br>– 0111: Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock)<br>– 1000: Announce<br>– 1001: Management<br>– 1010: Signaling<br>– 1011–1110: Reserved<br>– 1111: PTP packet with Reserved message type<br>These bits are available only when you select the timestamp feature. |

**Table 518. RDES1 normal descriptor (write-back format)(1) (continued)**

| Bit | Name | Description |
|---|---|---|
| 7 | IPCE | **IP Payload Error**<br>When this bit is set, it indicates either of the following:<br>– The 16-bit IP payload checksum (that is, the TCP, UDP, or ICMP checksum) calculated by the MAC does not match the corresponding checksum field in the received segment.<br>– The TCP, UDP, or ICMP segment length does not match the payload length value in the IP Header field.<br>– The TCP, UDP, or ICMP segment length is less than minimum allowed segment length for TCP, UDP, or ICMP.<br>Bit 15 (ES) of RDES3 is not set when this bit is set. |
| 6 | IPCB | **IP Checksum Bypassed**<br>This bit indicates that the checksum offload engine is bypassed. |
| 5 | IPV6 | **IPv6 header Present**<br>This bit indicates that an IPV6 header is detected. |
| 4 | IPV4 | **IPV4 Header Present**<br>This bit indicates that an IPV4 header is detected. |
| 3 | IPHE | **IP Header Error**<br>When this bit is set, it indicates either of the following:<br>– The 16-bit IPv4 header checksum calculated by the MAC does not match the received checksum bytes.<br>– The IP datagram version is not consistent with the Ethernet Type value.<br>– Ethernet packet does not have the expected number of IP header bytes.<br>This bit is valid when either bit 5 or bit 4 is set. |
| 2:0 | PT | **Payload Type**<br>These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE):<br>– 000: Unknown type or IP/AV payload not processed<br>– 001: UDP<br>– 010: TCP<br>– 011: ICMP<br>– 110: AV Tagged Data Packet<br>– 111: AV Tagged Control Packet<br>– 101: AV Untagged Control Packet<br>– Others: reserved.<br>If the COE does not process the payload of an IP datagram because there is an IP header error or fragmented IP, it sets these bits to 3'b000. |

1. The Status fields in write-back format are valid only for the last descriptor (RDES3[28] is set).

- RDES2 normal descriptor (write-back format)

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 519. RDES2 normal descriptor (write-back format)**

| Bit | Name | Description |
|---|---|---|
| 31:29 | L3L4FM | **Layer 3 and Layer 4 Filter Number Matched**<br>These bits indicate the number of the Layer 3 and Layer 4 Filter that matched the received packet:<br>– 000: Filter 0<br>– 001: Filter 1<br>– 010: Filter 2<br>– 011: Filter 3<br>– 100: Filter 4<br>– 101: Filter 5<br>– 110: Filter 6<br>– 111: Filter 7<br>This field is valid only when bit 28 or bit 27 is set high. When more than one filter matches, these bits give the number of lowest filter. |
| 28 | L4FM | **Layer 4 Filter Match**<br>When this bit is set, it indicates that the received packet matches one of the enabled Layer 4 Port Number fields. This status is given only when one of the following conditions is true:<br>– Layer 3 fields are not enabled and all enabled Layer 4 fields match<br>– All enabled Layer 3 and Layer 4 filter fields match<br>When more than one filter matches, this bit gives the layer 4 filter status of filter indicated by bits[31:29]. |
| 27 | L3FM | **Layer 3 Filter Match**<br>When this bit is set, it indicates that the received packet matches one of the enabled Layer 3 IP Address fields. This status is given only when one of the following conditions is true:<br>– All enabled Layer 3 fields match and all enabled Layer 4 fields are bypassed<br>– All enabled filter fields match<br>When more than one filter matches, this bit gives the layer 3 filter status of filter indicated by bits[31:29]. |
| 26:19 | MADRM | **MAC Address Match or Hash Value**<br>When the HF bit is reset, this field contains the MAC address register number that matched the Destination address of the received packet. This field is valid only if the DAF bit is reset.<br>When the HF bit is set, this field contains the Hash value computed by the MAC. A packet passes the Hash filter when the bit corresponding to the Hash value is set in the Hash filter register. |
| 18 | HF | **Hash Filter Status**<br>When this bit is set, it indicates that the packet passed the MAC address Hash filter. its[26:19] indicate the Hash value. |
| 17 | DAF | **Destination Address Filter Fail**<br>When this bit is set, it indicates that the packet failed the DA Filter in the MAC. |

**Table 519. RDES2 normal descriptor (write-back format) (continued)**

| Bit | Name | Description |
|---|---|---|
| 16 | SAF | **SA Address Filter Fail**<br>When this bit is set, it indicates that the packet failed the SA Filter in the MAC. |
| 15 | VF | **VLAN Filter Status**<br>When this bit is set, it indicates that the VLAN Tag of received packet passed the VLAN filter. |
| 14:11 | Reserved | |
| 10 | ARPNR | **ARP Reply Not Generated**<br>When this bit is set, it indicates that the MAC did not generate the ARP Reply for received ARP Request packet. This bit is set when the MAC is busy transmitting ARP reply to earlier ARP request (only one ARP request is processed at a time). |
| 9:0 | Reserved | |

- RDES3 normal descriptor (write-back format)

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| ES | PL | | | | | | | | | | | | | | |

**Table 520. RDES3 normal descriptor (write-back format)**

| Bit | Name | Description |
|---|---|---|
| 31 | OWN | **Own bit**<br>1: The DMA owns the descriptor.<br>0: The application owns the descriptor.<br>The DMA clears this bit when either of the following conditions is true:<br>– The DMA completes the packet reception<br>– The buffers associated with the descriptor are full |
| 30 | CTXT | **Receive Context Descriptor**<br>When this bit is set, it indicates that the current descriptor is a context type descriptor. The DMA writes 0 to this bit for normal receive descriptor. |
| 29 | FD | **First Descriptor**<br>When this bit is set, it indicates that this descriptor contains the first buffer of the packet. If the size of the first buffer is 0, the second buffer contains the beginning of the packet. If the size of the second buffer is also 0, the next descriptor contains the beginning of the packet. |
| 28 | LD | **Last Descriptor**<br>When this bit is set, it indicates that the buffers to which this descriptor is pointing are the last buffers of the packet. |

**Table 520. RDES3 normal descriptor (write-back format) (continued)**

| Bit | Name | Description |
|---|---|---|
| 27 | RS2V | **Receive Status RDES2 Valid**<br>When this bit is set, it indicates that the status in RDES2 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set. |
| 26 | RS1V | **Receive Status RDES1 Valid**<br>When this bit is set, it indicates that the status in RDES1 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set. |
| 25 | RS0V | **Receive Status RDES0 Valid**<br>When this bit is set, it indicates that the status in RDES0 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set. |
| 24 | CE | **CRC Error**<br>When this bit is set, it indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received packet. This field is valid only when the LD bit of RDES3 is set. |
| 23 | GP | **Giant Packet**<br>When this bit is set, it indicates that the packet length exceeds the specified maximum Ethernet size of 1518, 1522, or 2000 bytes (9018 or 9022 bytes if jumbo packet enable is set).<br>*Note: Giant packet indicates only the packet length. It does not cause any packet truncation.* |
| 22 | RWT | **Receive Watchdog Timeout**<br>When this bit is set, it indicates that the Receive Watchdog Timer has expired while receiving the current packet. The current packet is truncated after watchdog timeout. |
| 21 | OE | **Overflow Error**<br>When this bit is set, it indicates that the received packet is damaged because of buffer overflow in Rx FIFO.<br>*Note: This bit is set only when the DMA transfers a partial packet to the application. This happens only when the Rx FIFO is operating in the threshold mode. In the store-and-forward mode, all partial packets are dropped completely in Rx FIFO.* |
| 20 | RE | **Receive Error**<br>When this bit is set, it indicates that the ETH_RX_ER signal is asserted while the ETH_RX_DV signal is asserted during packet reception. This error also includes carrier extension error in the GMII and half-duplex mode. Error can be of less or no extension, or error (rxd!= 0f) during extension. |
| 19 | DE | **Dribble Bit Error**<br>When this bit is set, it indicates that the received packet has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode. |

**Table 520. RDES3 normal descriptor (write-back format) (continued)**

| Bit | Name | Description |
|---|---|---|
| 18:16 | LT | **Length/Type Field**<br>This field indicates if the packet received is a length packet or a type packet. The encoding of the 3 bits is as follows:<br>– 000: The packet is a length packet<br>– 001: The packet is a type packet.<br>– 011: The packet is a ARP Request packet type<br>– 100: The packet is a type packet with VLAN Tag<br>– 101: The packet is a type packet with Double VLAN Tag<br>– 110: The packet is a MAC Control packet type<br>– 111: The packet is a OAM packet type<br>– 010: Reserved |
| 15 | ES | **Error Summary**<br>– When this bit is set, it indicates the logical OR of the following bits:<br>– RDES3[24]: CRC Error<br>– RDES3[19]: Dribble Error<br>– RDES3[20]: Receive Error<br>– RDES3[22]: Watchdog Timeout<br>– RDES3[21]: Overflow Error<br>– RDES3[23]: Giant Packet<br>This field is valid only when the LD bit of RDES3 is set. |
| 14:0 | PL | **Packet Length**<br>These bits indicate the byte length of the received packet that was transferred to system memory (including CRC).<br>This field is valid when the LD bit of RDES3 is set and either the Descriptor Error (RDES3[13]) or Overflow Error bits are reset. The packet length also includes the two bytes appended to the Ethernet packet when IP checksum calculation is enabled and the received packet is not a MAC control packet.<br>This field is valid when the LD bit of RDES3 is set. When the Last Descriptor and Error Summary bits are not set, this field indicates the accumulated number of bytes that have been transferred for the current packet. |

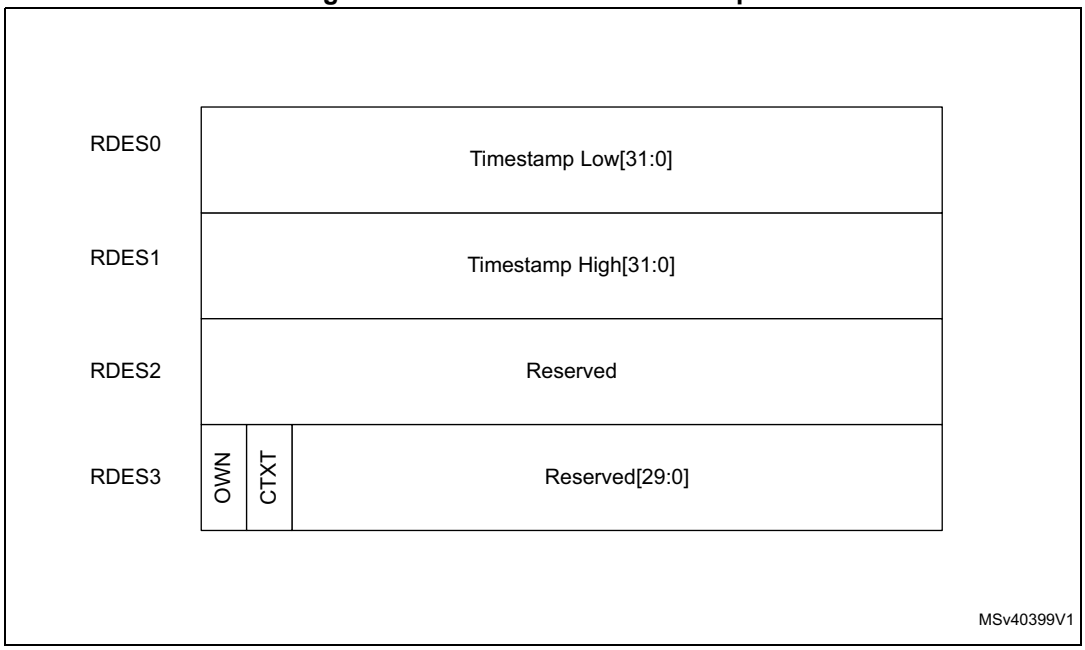
### Receive context descriptor

This descriptor is read-only for the application. This descriptor can be written only by the DMA.

The context descriptor provides information about the extended status related to the last received packet. Bit 30 of RDES3 indicates the context type descriptor.

*Figure 809* shows the format for Receive context descriptors. *Table 521* to *Table 524* provide a detailed description of all Receive context descriptors.

**Figure 809. Receive context descriptor**



- RDES0 context descriptor

**Table 521. RDES0 context descriptor**

| Bit | Name | Description |
|---|---|---|
| 31:0 | RTSL | **Receive Packet Timestamp Low**<br>The DMA updates this field with least significant 32 bits of the timestamp captured for corresponding Receive packet. When this field and the RTSH field of RDES1 show all-ones value, the timestamp must be considered as corrupt. |

- RDES1 context descriptor

**Table 522. RDES1 context descriptor**

| Bit | Field | Description |
|---|---|---|
| 31:0 | RTSH | **Receive Packet Timestamp High**<br>The DMA updates this field with most significant 32 bits of the timestamp captured for corresponding receive packet. When this field and the RTSL field of RDES0 show all-ones value, the timestamp must be considered as corrupt. |

- RDES2 context descriptor

**Table 523. RDES2 context descriptor**

| Bit | Description |
|---|---|
| 31:0 | Reserved |

- RDES3 context descriptor

**Table 524. RDES3 context descriptor**

| Bit | Name | Description |
|---|---|---|
| 31 | OWN | **Own Bit**<br>1; The DMA owns the descriptor<br>0: The application owns the descriptor.<br>The DMA clears this bit when either of the following conditions is true:<br>– The DMA completes the packet reception<br>– The buffers associated with the descriptor are full |
| 30 | CTXT | **Receive Context Descriptor**<br>When this bit is set, it indicates that the current descriptor is a context descriptor. The DMA writes 1'b1 to this bit for context descriptor. |
| 29:0 | Reserved | |

# 64.11 Ethernet registers

## 64.11.1 Ethernet registers maps

This section provides the following register maps:

- DMA registers (see *Section 64.11.2: Ethernet DMA registers*)
- MTL registers (see *Section 64.11.3: Ethernet MTL registers*)
- MAC registers including MMC register (see *Section 64.11.4: Ethernet MAC and MMC registers*)

## 64.11.2 Ethernet DMA registers

### DMA mode register (ETH_DMAMR)

Address offset: 0x1000

Reset value: 0x0000 0000

The DMA mode register establishes the bus operating modes for the DMA.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | INTM[1:0] | |
| | | | | | | | | | | | | | | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | PR[2:0] | | | TXPR | Res. | Res. | Res. | Res. | Res. | Res. | TAA[2:0] | | | Res. | SWR |
| | r | r | r | r | | | | | | | r | r | r | | rw |

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **INTM[1:0]**: Interrupt Mode

This field defines the interrupt mode of the Ethernet peripheral.
The behavior of the interrupt signal and of the RI/TI bits in the ETH_DMACSR register changes depending on the INTM value (refer to *Table 500: Transfer complete interrupt behavior*).

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **PR[2:0]**: Priority ratio

These bits control the priority ratio in weighted round-robin arbitration between the Rx DMA and Tx DMA. These bits are valid only when the DA bit is reset. The priority ratio is Rx:Tx or Tx:Rx depending on whether the TXPR bit is reset or set.
000: The priority ratio is 1:1
001: The priority ratio is 2:1
010: The priority ratio is 3:1
011: The priority ratio is 4:1
100: The priority ratio is 5:1
101: The priority ratio is 6:1
110: The priority ratio is 7:1
111: The priority ratio is 8:1

Bit 11 **TXPR**: Transmit priority

When set, this bit indicates that the Tx DMA has higher priority than the Rx DMA during arbitration for the system-side bus.

Bits 10:5 Reserved, must be kept at reset value.

Bits 4:2 **TAA[2:0]**: Transmit Arbitration Algorithm

This field is used to select the arbitration algorithm for the Transmit side when multiple Tx DMAs are selected.

000: Fixed priority. In fixed priority, Channel 0 has the lowest priority and the last channel has the highest priority.

001: Weighted Strict Priority (WSP)

010: Weighted Round-Robin (WRR)

011-111: Reserved

Bit 1 Reserved, must be kept at reset value.

Bit 0 **SWR**: Software Reset

When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all clock domains. Before reprogramming any register, a value of zero should be read in this bit.

*Note: The reset operation is complete only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock.*

### System bus mode register (ETH_DMASBMR)

Address offset: 0x1004

Reset value: 0x0101 0000

The System bus mode register controls the behavior of the AXI master. It mainly controls burst splitting and number of outstanding requests.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| EN_LPI | LPI_XIT_PKT | Res. | Res. | Res. | Res. | WR_OSR_LMT[1:0] | | Res. | Res. | Res. | Res. | Res. | Res. | RD_OSR_LMT[1:0] | |
| rw | rw | | | | | rw | rw | | | | | | | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | ONEKBBE | AAL | Res. | Res. | Res. | Res. | BLEN256 | BLEN128 | BLEN64 | BLEN32 | BLEN16 | BLEN8 | BLEN4 | FB |
| | | rw | rw | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **EN_LPI**: Enable Low Power Interface (LPI)

When set to 1, this bit enables the LPI mode and accepts the LPI request from the AXI System Clock controller.

When set to 0, this bit disables the LPI mode and always denies the LPI request from the AXI System Clock controller.

Bit 30 **LPI_XIT_PKT**: Unlock on Magic Packet or Remote wakeup Packet

When set to 1, this bit enables the AXI master to come out of the LPI mode only when the magic packet or remote wakeup packet is received. When set to 0, this bit enables the AXI master to come out of the LPI mode when any packet is received.

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:24 **WR_OSR_LMT[1:0]**: AXI Maximum Write Outstanding Request Limit

This value limits the maximum outstanding request on the AXI write interface. Maximum outstanding requests = WR_OSR_LMT + 1

Bit 27 is reserved

Bit 26 is reserved

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **RD_OSR_LMT[1:0]**: AXI Maximum Read Outstanding Request Limit

This value limits the maximum outstanding request on the AXI read interface. Maximum outstanding requests = RD_OSR_LMT + 1

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **ONEKBBE**: 1 Kbyte Boundary Crossing Enable for the AXI Master

When set, the burst transfers performed by the AXI master do not cross 1 Kbyte boundary. When reset, the burst transfers performed by the AXI master do not cross 4 Kbyte boundary.

Bit 12 **AAL**: Address-Aligned Beats

When this bit is set to 1, the master performs address-aligned burst transfers on Read and Write channels.

Bits 11:8 Reserved, must be kept at reset value.

Bit 7 **BLEN256**: AXI Burst Length 256
When this bit is set to 1, the AXI master can select a burst length of 256 on the AXI interface.

Bit 6 **BLEN128**: AXI Burst Length 128
When this bit is set to 1, the AXI master can select a burst length of 128 on the AXI interface.

Bit 5 **BLEN64**: AXI Burst Length 64
When this bit is set to 1, the AXI master can select a burst length of 64 on the AXI interface.

Bit 4 **BLEN32**: AXI Burst Length 32
When this bit is set to 1, the AXI master can select a burst length of 32 on the AXI interface.

Bit 3 **BLEN16**: AXI Burst Length 16
When this bit is set to 1 or the FB bit is set to 0, the AXI master can select a burst length of 16 on the AXI interface.
When the FB bit is set to 0, setting this bit has no effect.

Bit 2 **BLEN8**: AXI Burst Length 8
When this bit is set to 1 or the FB bit is set to 0, the AXI master can select a burst length of 8 on the AXI interface.
When the FB bit is set to 0, setting this bit has no effect.

Bit 1 **BLEN4**: AXI Burst Length 4
When this bit is set to 1 or the FB bit is set to 0, the AXI master can select a burst length of 4 on the AXI interface.
When the FB bit is set to 0, setting this bit has no effect.

Bit 0 **FB**: Fixed Burst Length
When this bit is set to 1, the AXI master will initiate burst transfers of specified lengths as given below.

- Burst transfers of fixed burst lengths as indicated by the BLEN256, BLEN128, BLEN64, BLEN32, BLEN16, BLEN8, or BLEN4 field
- Burst transfers of length 1: when this bit is set to 0, the AXI master initiates burst transfers that are equal to or less than the maximum allowed burst length programmed in Bits[7:1].

### Interrupt status register (ETH_DMAISR)

Address offset: 0x1008

Reset value: 0x0000 0000

The application reads this Interrupt Status register during interrupt service routine or polling to determine the interrupt status of DMA channels, MTL queues, and the MAC.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MACIS | MTLIS |
| | | | | | | | | | | | | | | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DC1IS | DC0IS |
| | | | | | | | | | | | | | | r | r |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **MACIS**: MAC Interrupt Status

This bit indicates an interrupt event in the MAC. To reset this bit to 1'b0, the software must read the corresponding register in the MAC to get the exact cause of the interrupt and clear its source.

Bit 16 **MTLIS**: MTL Interrupt Status

This bit indicates an interrupt event in the MTL. To reset this bit to 1'b0, the software must read the corresponding register in the MTL to get the exact cause of the interrupt and clear its source.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **DC1IS**: DMA Channel 1 Interrupt Status

This bit indicates an interrupt event in DMA Channel 1. To reset this bit to 0, the software must read the corresponding register in DMA Channel 1 to get the exact cause of the interrupt and clear its source.

Bit 0 **DC0IS**: DMA Channel 0 Interrupt Status

This bit indicates an interrupt event in DMA Channel 0. To reset this bit to 0, the software must read the corresponding register in DMA Channel 0 to get the exact cause of the interrupt and clear its source.

### Debug status register (ETH_DMADSR)

Address offset: 0x100C

Reset value: 0x0000 0000

The Debug status register gives the Receive and Transmit process status for DMA Channel 0 and Channel 1 for debugging purpose.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TPS1[3:0] | | | | RPS1[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TPS0[3:0] | | | | RPS0[3:0] | | | | Res. | Res. | Res. | Res. | Res. | Res. | AXR HSTS | AXW HSTS |
| r | r | r | r | r | r | r | r | | | | | | | r | r |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **TPS1[3:0]**: DMA Channel 1 Transmit Process State

This field indicates the Tx DMA FSM state for Channel 1. This field is similar to the TPS0 field.

Bits 19:16 **RPS1[3:0]**: DMA Channel 1 Receive Process State

This field indicates the Rx DMA FSM state for Channel 1. This field is similar to the RPS0 field.

Bits 15:12 **TPS0[3:0]**: DMA Channel 0 Transmit Process State

This field indicates the Tx DMA FSM state for Channel 0:
000: Stopped (Reset or Stop Transmit Command issued)
001: Running (Fetching Tx Transfer Descriptor)
010: Running (Waiting for status)
011: Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO))
100: Timestamp write state
101: Reserved for future use
110: Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow)
111: Running (Closing Tx Descriptor)
The MSB of this field always returns 0. This field does not generate an interrupt.

Bits 11:8 **RPS0[3:0]**: DMA Channel 0 Receive Process State
This field indicates the Rx DMA FSM state for Channel 0:
000: Stopped (Reset or Stop Receive Command issued)
001: Running (Fetching Rx Transfer Descriptor)
010: Reserved for future use
011: Running (Waiting for Rx packet)
100: Suspended (Rx Descriptor Unavailable)
101: Running (Closing the Rx Descriptor)
110: Timestamp write state
111: Running (Transferring the received packet data from the Rx buffer to the system memory)
The MSB of this field always returns 0. This field does not generate an interrupt.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **AXRHSTS**: AXI Master Read Channel Status
When high, this bit indicates that the read channel of the AXI master is active, and it is transferring the data.

Bit 0 **AXWHSTS**: AXI Master Write Channel
When high, this bit indicates that the write channel of the AXI master is active, and it is transferring data.

### AXI4 transmit channel ACE control register (ETH_DMAA4TXACR)

Address offset: 0x1020

Reset value: 0x0000 0000

This register is used to control the AXI4 Cache Coherency Signals for read transactions by all the Transmit DMA channels. The following signals of the AXI4 interface are driven with different values as programmed for corresponding type (descriptor, buffer1, buffer2) of access:

- arcache_m_o[3:0]

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **THC[3:0]**: Transmit DMA First Packet Buffer or TSO Header Cache Control
When TSO is NOT enabled, This field is used to drive arcache_o[3:0] signal when Transmit DMA is accessing First Buffer of the Packet (First valid buffer with FD being set in the TDES3 of the Descriptor).
When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO Header data.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TEC[3:0]**: Transmit DMA Extended Packet Buffer or TSO Payload Cache Control
When TSO is NOT enabled, This field is used to drive arcache o[3:0] signal when Transmit DMA is accessing the extended buffers (when packet is distributed across multiple buffers).
When TSO is enabled, This field is used to drive arcache_o[3:0] signal when the Transmit DMA is accessing the TSO payload data.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TDRC[3:0]**: Transmit DMA Read Descriptor Cache Control
This field is used to drive arcache_o[3:0] signal when Transmit DMA engines access the Descriptor.

### AXI4 receive channel ACE control register (ETH_DMAA4RXACR)

Address offset: 0x1024

Reset value: 0x0000 0000

This register is used to control the AXI4 Cache Coherency Signals for write transactions by all the Receive DMA channels. The following signals of the AXI4 interface are driven with different values as programmed for corresponding type (descriptor, buffer1, buffer2) of access:

- awcache_m_o[3:0]

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **RDC[3:0]**: Receive DMA Buffer Cache Control

This field is used to drive awcache_o[3:0] signal when Receive DMA is accessing the Buffer when Header and payload are NOT separated.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **RHC[3:0]**: Receive DMA Header Cache Control

This field is used to drive awcache_o[3:0] and signal when Receive DMA is accessing the header Buffer when Header and payload are separated.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **RPC[3:0]**: Receive DMA Payload Cache Control

This field is used to drive awcache_o[3:0] signal when Receive DMA is accessing the Payload Buffer when Header and payload are separated.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **RDWC[3:0]**: Receive DMA Write Descriptor Cache Control

This field is used to drive awcache_o[3:0] signal when Receive DMA accesses the Descriptor.

### AXI4 descriptor ACE control register (ETH_DMAA4DACR)

Address offset: 0x1028

Reset value: 0x0000 0000

This register is used to control the AXI4 Cache Coherency Signals for Descriptor write transactions by all the TxDMA channels and Descriptor read transactions by all the RxDMA channels. It also controls the values to be driven on awprot_m_o and arprot_m_o.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **RDRC[3:0]**: Receive DMA Read Descriptor Cache control
This field is used to drive arcache_o[3:0] signal when Receive DMA engines read the Descriptor.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **TDWD[1:0]**: Transmit DMA Write Descriptor Domain control
This field is used to drive awdomain_o[1:0] signal when Transmit DMA write to the Descriptor.

Bits 3:0 **TDWC[3:0]**: Transmit DMA Write Descriptor Cache control
This field is used to drive awcache_o[3:0] signal when Transmit DMA writes to the Descriptor.

### Channel i control register (ETH_DMACiCR)

Address offset: 0x1100 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The DMA Channel i Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DSL[2:0] | | | Res. | PBL X8 |
| | | | | | | | | | | | rw | rw | rw | | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | MSS[13:0] | | | | | | | | | | | | | |
| | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:18 **DSL[2:0]**: Descriptor Skip Length

This bit specifies the 64-bit double-word number to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor.

When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **PBLX8**: 8xPBL mode

When this bit is set, the PBL value programmed in Bits[21:16] in ETH_DMACiTXCR is multiplied eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **MSS[13:0]**: Maximum Segment Size

This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of ETH_DMACiTXCR register is set.

The value programmed in this field must be more than the configured Data width in bytes. It is recommended to use a MSS value of 64 bytes or more.

This field is reserved when the Enable TCP Segmentation Offloading for TCP/IP Packets option is not selected.

### Channel i transmit control register (ETH_DMACiTXCR)

Address offset: 0x1104 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The DMA Channel i Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | TQOS[3:0] | | | | Res. | Res. | TXPBL[5:0] | | | | | |
| | | | | rw | rw | rw | rw | | | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | TSE | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OSF | TCW[2:0] | | | ST |
| | | | rw | | | | | | | | rw | r | r | r | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **TQOS[3:0]**: Transmit QOS.

This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Tx Channel i.

and read-only.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **TXPBL[5:0]**: Transmit Programmable Burst Length

These bits indicate the maximum number of beats to be transferred in one DMA data transfer. This is the maximum value that is used in a single block Read or Write. The DMA always attempts to burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior.

To transfer more than 32 beats, perform the following steps:

1. Set the PBLx8 mode in ETH_DMACiCR.
2. Set the PBL.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **TSE**: TCP Segmentation Enabled

When this bit is set, the DMA performs the TCP segmentation for packets in Channel i. The TCP segmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor. When this bit is set, the TxPBL value must be greater than or equal to 4.

This field is reserved if Enable TCP Segmentation Offloading for TCP/IP Packets option is not selected.

Bits 11:5 Reserved, must be kept at reset value.

Bit 4 **OSF**: Operate on Second Packet

When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained.

Bits 3:1 **TCW[2:0]**: Transmit Channel Weight

This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.

Bit 0 **ST**: Start or Stop Transmission Command

When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted.

The DMA tries to acquire descriptor from either of the following positions:

- The current position in the list: this is the base address of the Transmit list set by the ETH_DMACiTXDLAR register.
- The position at which the transmission was previously stopped

If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the ETH_DMACiSR is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the ETH_DMACiTXDLAR register, the DMA behavior is unpredictable.

When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program ETH_DMACiTXDLAR register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state.

### Channel 0 receive control register (ETH_DMAC0RXCR)

Address offset: 0x1108

Reset value: 0x0000 0000

The DMA Channel 0 Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RPF | Res. | Res. | Res. | RQOS[3:0] | | | | Res. | Res. | RXPBL[5:0] | | | | | |
| rw | | | | rw | rw | rw | rw | | | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | RBSZ[13:0] | | | | | | | | | | | | | | SR |
| | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **RPF**: DMA Rx Channel0 Packet Flush
When this bit is set to 1, the DMA will automatically flush the packet from the Rx queues destined to DMA Rx Channel 0 when the DMA Rx Channel 0 is stopped after a system bus error has occurred.
The flushing happens on the Read side of the Rx queue.
When this bit is set to 0 the EQOS will not flush the packet in the Rx queue destined to DMA Rx Channel 0 after the DMA is stopped due to a system bus error.

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:24 **RQOS[3:0]**: Rx AXI4 QOS.
This field is used to drive arqos_m_o[3:0] or awqos_m_o[3:0] output signals for all transactions of DMA Rx Channel0.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **RXPBL[5:0]**: Receive Programmable Burst Length
These bits indicate the maximum number of beats to be transferred in one DMA data transfer. This is the maximum value that is used in a single block Read or Write. The DMA always attempts to burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior.
To transfer more than 32 beats, perform the following steps:
1. Set the PBLx8 mode in the ETH_DMAC0CR.
2. Set the PBL.

Bit 15 Reserved, must be kept at reset value.

Bits 14:1 **RBSZ[13:0]**: Receive Buffer size

This field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16 Kbytes. The buffer size is applicable to payload buffers when split headers are enabled.

*Note: The buffer size must be a multiple of 4, 8, or 16 depending on the bus widths (32, 64, or 128 respectively). This is required even if the value of buffer address pointer is not aligned to bus width. If the buffer size is not a multiple of 4, 8, or 16, it may result into undefined behavior.*

*The LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width are ignored and the DMA internally takes the LSB bits as all-zero. Therefore, these LSB bits are read-only (RO).*

Bit 0 **SR**: Start or Stop Receive

When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets.

The DMA tries to acquire descriptor from either of the following positions:

– The current position in the list: this is the address set by the ETH_DMAC0RXDLAR register.

– The position at which the Rx process was previously stopped

If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the ETH_DMAC0SR is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the ETH_DMAC0RXDLAR register, the DMA behavior is unpredictable.

When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state.

### Channel i Tx descriptor list address register (ETH_DMACiTXDLAR)

Address offset: 0x1114 +0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

Channel **i** Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Dword-aligned. The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in ETH_DMACiTXCR register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TDESLA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | |

Bits 31:3 **TDESLA[31:3]**: Start of Transmit List

This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 64-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO).

The width of this field depends on the configuration:

31:3 for 64-bit configuration

Bits 2:0 Reserved, must be kept at reset value.

### Channel 0 Rx descriptor list address register (ETH_DMAC0RXDLAR)

Address offset: 0x111C

Reset value: 0x0000 0000

The Channel 0 Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Dword-aligned. The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in ETH_DMAC0RXCR register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | |

Bits 31:3 **RDESLA[28:0]**: Start of Receive List

This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 64-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO).

The width of this field depends on the configuration:

31:3 for 64-bit configuration

Bits 2:0 Reserved, must be kept at reset value.

### Channel i Tx descriptor tail pointer register (ETH_DMACiTXDTPR)

Address offset: 0x1120 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Channel i Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | |

Bits 31:3 **TDT[31:3]**: Transmit Descriptor Tail Pointer

This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers.

The width of this field depends on the configuration:

31:3 for 64-bit configuration

Bits 2:0 Reserved, must be kept at reset value.

### Channel 0 Rx descriptor tail pointer register (ETH_DMAC0RXDTPR)

Address offset: 0x1128

Reset value: 0x0000 0000

The Channel 0 Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:3 **RDT[**31:3**]**: Receive Descriptor Tail Pointer

This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers.
The width of this field depends on the configuration:
31:3 for 64-bit configuration

Bits 2:0 Reserved, must be kept at reset value.

### Channel i Tx descriptor ring length register (ETH_DMACiTXRLR)

Address offset: 0x112C + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TDRL[9:0]**: Transmit Descriptor Ring Length

This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. It is recommended to put a minimum ring descriptor length of 4.

### Channel 0 Rx descriptor ring length register (ETH_DMAC0RXRLR)

Address offset: 0x1130

Reset value: 0x0000 0000

The Channel 0 Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **RDRL[9:0]**: Receive Descriptor Ring Length

This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors.

### Channel i interrupt enable register (ETH_DMACiIER)

Address offset: 0x1134 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Channel **i** Interrupt Enable register enables the interrupts reported by the Status register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **NIE**: Normal Interrupt Summary Enable

When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the ETH_DMAC0SR:
Bit 0: Transmit Interrupt
Bit 2: Transmit Buffer Unavailable
Bit 6: Receive Interrupt
Bit 11: Early Receive Interrupt
When this bit is reset, the normal interrupt summary is disabled.

Bit 14 **AIE**: Abnormal Interrupt Summary Enable

When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the ETH_DMAC0SR:
Bit 1: Transmit Process Stopped
Bit 7: Rx Buffer Unavailable
Bit 8: Receive Process Stopped
Bit 9: Receive Watchdog Timeout
Bit 10: Early Transmit Interrupt
Bit 12: Fatal Bus Error
When this bit is reset, the abnormal interrupt summary is disabled.

Bit 13 **CDEE**: Context Descriptor Error Enable

When this bit is set along with the AIE bit, the Context Descriptor error interrupt is enabled. When this bit is reset, the Context Descriptor error interrupt is disabled.

Bit 12 **FBEE**: Fatal Bus Error Enable

When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled.

Bit 11 **ERIE**: Early Receive Interrupt Enable

When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled.

Bit 10 **ETIE**: Early Transmit Interrupt Enable

When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled.

Bit 9 **RWTE**: Receive Watchdog Timeout Enable

When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled.

Bit 8 **RSE**: Receive Stopped Enable

When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled.

Bit 7 **RBUE**: Receive Buffer Unavailable Enable

When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled.

Bit 6 **RIE**: Receive Interrupt Enable

When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **TBUE**: Transmit Buffer Unavailable Enable

When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled.

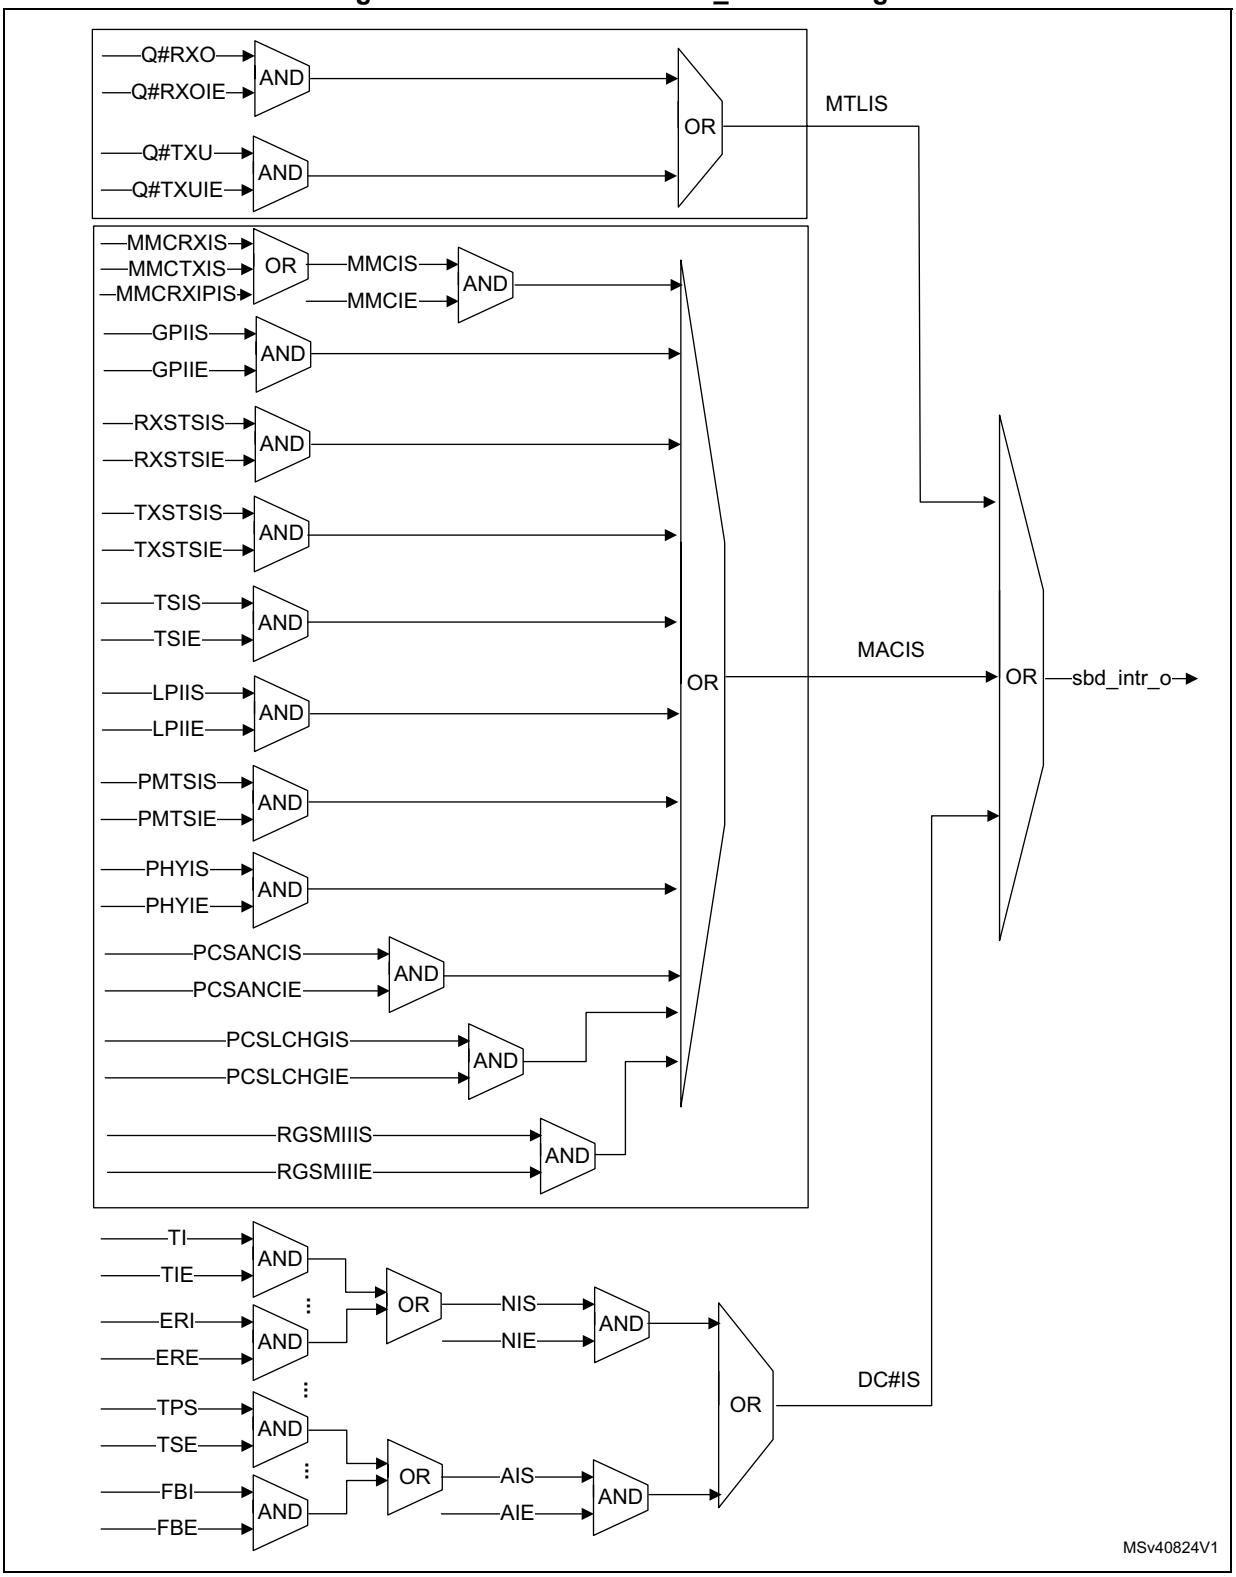
Bit 1 **TXSE**: Transmit Stopped Enable

When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled.

Bit 0 **TIE**: Transmit Interrupt Enable

When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled.

**Figure 810. Generation of ETH_DMAISR flags**



### Channel 0 Rx interrupt watchdog timer register (ETH_DMAC0RXIWTR)

Address offset: 0x1138

Reset value: 0x0000 0000

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the ETH_DMAC0SR register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RWT[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **RWT[7:0]**: Receive Interrupt Watchdog Timer Count

This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set.

The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the ETH_DMAC0SR, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30].

When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

### Channel i slot function control status register (ETH_DMACiSFCSR)

Address offset: 0x113C + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RSN[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ASC | ESC |
| | | | | | | | | | | | | | | rw | rw |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **RSN[3:0]**: Reference Slot Number

This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **ASC**: Advance Slot Check

When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is

– equal to the reference slot number given in the RSN field

or

– ahead of the reference slot number by up to two slots

This bit is applicable only when the ESC bit is set.

Bit 0 **ESC**: Enable Slot Comparison

When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is

– equal to the reference slot number

or

– ahead of the reference slot number by one slot

When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed.

### Channel i current application transmit descriptor register (ETH_DMACiCATXDR)

Address offset: 0x1144 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Channel **i** Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **CURTDESAPTR[31:0]**: Application Transmit Descriptor Address Pointer
The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

### Channel 0 current application receive descriptor register (ETH_DMAC0CARXDR)

Address offset: 0x114C

Reset value: 0x0000 0000

The Channel0 Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **CURRDESAPTR[31:0]**: Application Receive Descriptor Address Pointer
The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

### Channel i current application transmit buffer register (ETH_DMACiCATXBR)

Address offset: 0x1154 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Channel **i** Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| CURTBUFAPTR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **CURTBUFAPTR[31:0]**: Application Transmit Buffer Address Pointer
The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

### Channel 0 current application receive buffer register (ETH_DMAC0CARXBR)

Address offset: 0x115C

Reset value: 0x0000 0000

The Channel 0 Current Application Receive Buffer Address register points to the current Rx buffer address read by the DMA.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CURRBUFAPTR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **CURRBUFAPTR[31:0]**: Application Receive Buffer Address Pointer
The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

### Channel i status register (ETH_DMACiSR)

Address offset: 0x1160 + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | | rw | rw | rw |

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **REB[2:0]**: Rx DMA Error Bits

This field indicates the type of error that caused a Bus Error. For example, error response on the AXI interface.
Bit 21
1: Error during data transfer by Rx DMA
0: No Error during data transfer by Rx DMA
Bit 20
1: Error during descriptor access
0: Error during data buffer access
Bit 19
1: Error during read transfer
0: Error during write transfer
This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Bits 18:16 **TEB[2:0]**: Tx DMA Error Bits

This field indicates the type of error that caused a Bus Error. For example, error response on the AXI interface.
Bit 18
1: Error during data transfer by Tx DMA
0: No Error during data transfer by Tx DMA
Bit 17
1: Error during descriptor access
0: Error during data buffer access
Bit 16
1: Error during read transfer
0: Error during write transfer
This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Bit 15 **NIS**: Normal Interrupt Summary

Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the ETH_DMACiIER register:
Bit 0: Transmit Interrupt
Bit 2: Transmit Buffer Unavailable
Bit 6: Receive Interrupt
Bit 11: Early Receive Interrupt
Only unmasked bits (interrupts for which interrupt enable is set in ETH_DMACiIER register) affect the Normal Interrupt Summary bit.
This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared.

Bit 14 **AIS**: Abnormal Interrupt Summary

Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the ETH_DMACiIER register:

Bit 1: Transmit Process Stopped

Bit 7: Receive Buffer Unavailable

Bit 8: Receive Process Stopped

Bit 10: Early Transmit Interrupt

Bit 12: Fatal Bus Error

Bit 13: Context Descriptor Error

Only unmasked bits affect the Abnormal Interrupt Summary bit.

This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared.

Bit 13 **CDE**: Context Descriptor Error

This bit indicates that the DMA Tx engine received a context descriptor in the middle of a packet (in an intermediate descriptor), and the DMA Tx engine ignored it.

Bit 12 **FBE**: Fatal Bus Error

This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses.

Bit 11 **ERI**: Early Receive Interrupt

This bit indicates that the DMA filled the first data buffer of the packet. The RI bit of this register automatically clears this bit.

Bit 10 **ETI**: Early Transmit Interrupt

This bit indicates that the packet to be transmitted is fully transferred to the MTL Tx FIFO.

Bit 9 **RWT**: Receive Watchdog Timeout

This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received.

Bit 8 **RPS**: Receive Process Stopped

This bit is asserted when the Rx process enters the Stopped state.

Bit 7 **RBU**: Receive Buffer Unavailable

This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor.

Bit 6 **RI**: Receive Interrupt

This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES1 is reset in the last descriptor, and the specific packet status information is updated in the descriptor.

The reception remains in the Running state.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **TBU**: Transmit Buffer Unavailable

This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions.

To resume processing the Transmit descriptors, the application should do the following:

1. Change the ownership of the descriptor by setting Bit 31 of TDES3.
2. Issue a Transmit Poll Demand command.

For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel.

Bit 1 **TPS**: Transmit Process Stopped

This bit is set when the transmission is stopped.

Bit 0 **TI**: Transmit Interrupt

This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor.

### Channel i missed frame count register (ETH_DMACiMFCR)

Address offset: 0x116C + 0x80 * i, (i = 0 to 1)

Reset value: 0x0000 0000

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programing RPF field in ETH_DMACiRXCR register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | | | | | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **MFCO**: Overflow status of the MFC Counter

When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **MFC[10:0]**: Dropped Packet Counters

This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing

RPF field in ETH_DMAC0RXCR register. The counter gets cleared when this register is read.

## 64.11.3 Ethernet MTL registers

### Operating mode Register (ETH_MTLOMR)

Address offset: 0x0C00

Reset value: 0x0000 0000

The Operating Mode register establishes the Transmit and Receive operating modes and commands.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | CNTCLR | CNTPRST | Res. | SCHALG[1:0] | | Res. | Res. | RAA | DTXSTS | Res. |
| | | | | | | rw | rw | | rw | rw | | | rw | rw | |

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **CNTCLR**: Counters Reset

When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. If this bit is set along with CNT_PRESET bit, CNT_PRESET has precedence.

Bit 8 **CNTPRST**: Counters Preset

When this bit is set:

- ETH_MTLTXQiUR register is initialized/preset to 0x7F0.
- Missed Packet and Overflow Packet counters in ETH_MTLRXQiMPOCR register is initialized/preset to 0x7F0

Bit 7 Reserved, must be kept at reset value.

Bits 6:5 **SCHALG[1:0]**: Tx Scheduling Algorithm

This field indicates the algorithm for Tx scheduling:
00: WRR algorithm
01: Reserved
10: Reserved.
11: Strict priority algorithm.

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **RAA**: Receive Arbitration Algorithm

This field is used to select the arbitration algorithm for the Rx side.

0: Strict priority (SP)

Queue 0 has the lowest priority and the last queue has the highest priority.

1: Weighted Strict Priority (WSP)

This bit is reserved and read-only (RO) when the Number of Rx queue is one while configuring the core.

Bit 1 **DTXSTS**: Drop Transmit Status

When this bit is set, the Tx packet status received from the MAC is dropped in the MTL. When this bit is reset, the Tx packet status received from the MAC is forwarded to the application.

This bit is reserved and read-only when the Disable Transmit Status in MTL feature is selected while configuring the core.

Bit 0 Reserved, must be kept at reset value.

### Interrupt status Register (ETH_MTLISR)

Address offset: 0x0C20

Reset value: 0x0000 0000

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **Q1IS**: Queue 1 interrupt status

This bit indicates that an interrupt has been generated by Queue 1. To reset this bit, read ETH_MTLQ1ICSR register to identify the interrupt cause and clear the source.

Bit 0 **Q0IS**: Queue 0 interrupt status

This bit indicates that an interrupt has been generated by Queue 0. To reset this bit, read ETH_MTLQ0ICSR register to identify the interrupt cause and clear the source.

### Tx queue i operating mode Register (ETH_MTLTXQiOMR)

Address offset: 0x0D00 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Transmit Operating Mode register establishes the Transmit queue operating modes and commands.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | TQS[8:0] | | | | | | | | |

| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **TQS[8:0]**: Transmit Queue Size

This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The sixteenth bit is the starting bit of this field. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits:
LOG2(2048/256) = LOG2(8) = 3 bits
TQS = 0 corresponds to 256 bytes.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **TTC[2:0]**: Transmit Threshold Control

These bits control the threshold level of the MTL Tx queue. The transmission starts when the packet size within the MTL Tx queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset.
000: 32
001: 64
010: 96
011: 128
100: 192
101: 256
110: 384
111: 512

Bits 3:2 **TXQEN[1:0]**: Transmit Queue Enable

This field is used to enable/disable the transmit queue 0.

00: Not enabled

01: Reserved

10: Enabled

11: Reserved

*Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field.*

Bit 1 **TSF**: Transmit Store and Forward

When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped.

Bit 0 **FTQ**: Flush Transmit Queue

When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the ETH_MTLTXQ1OMR register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission.

*Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (eth_mii_tx_clk) should be active.*

### Tx queue i underflow register (ETH_MTLTXQiUR)

Address offset: 0x0D04 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **UFCNTOVF**: Overflow Bit for Underflow Packet Counter

This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened.

Bits 10:0 **UFFRMCNT[10:0]**: Underflow Packet Counter

This field indicates the number of packets aborted by the controller because of Tx queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read.

### Tx queue i debug Register (ETH_MTLTXQiDR)

Address offset: 0x0D08 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | r | r | r | r | r | r |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:20 **STXSTSF[2:0]**: Number of Status Words in Tx Status FIFO of Queue

This field indicates the current number of status in the Tx Status FIFO of this queue. This field is reserved when the Disable Transmit Status in MTL feature is selected while configuring the core.

When the DTXSTS bit of ETH_MTLOMR register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **PTXQ[2:0]**: Number of Packets in the Transmit Queue

This field indicates the current number of packets in the Tx queue. This field is reserved when the Disable Transmit Status in MTL feature is selected while configuring the core.

When the DTXSTS bit of ETH_MTLOMR register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bits 15:6 Reserved, must be kept at reset value.

Bit 5 **TXSTSFSTS**: MTL Tx Status FIFO Full Status

When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission.

This field is reserved when the Disable Transmit Status in MTL feature is selected while configuring the core.

Bit 4 **TXQSTS**: MTL Tx Queue Not Empty Status
When this bit is high, it indicates that the MTL Tx queue is not empty and some data is left for transmission.

Bit 3 **TWCSTS**: MTL Tx Queue Write Controller Status
When high, this bit indicates that the MTL Tx queue Write Controller is active, and it is transferring the data to the Tx queue.

Bits 2:1 **TRCSTS[1:0]**: MTL Tx Queue Read Controller Status
This field indicates the state of the Tx Queue Read Controller:
00: Idle state
01: Read state (transferring data to the MAC transmitter)
10: Waiting for pending Tx Status from the MAC transmitter
11: Flushing the Tx queue because of the Packet Abort request from the MAC

Bit 0 **TXQPAUSED**: Transmit Queue in Pause
When this bit is high and the Rx flow control is enabled, it indicates that the Tx queue is in the Pause condition (in the full-duplex only mode) because of the following:
– Reception of the PFC packet for the priorities assigned to the Tx queue when PFC is enabled
– Reception of 802.3x Pause packet when PFC is disabled

### Tx queue x ETS status Register (ETH_MTLTXQiESR)

Address offset: 0x0D14 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue x ETS Status register provides the average traffic transmitted in Queue x.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:0 **ABS[23:0]**: Average Bits per Slot
This field contains the average transmitted bits per slot.
When the DCB operation is enabled for Queue x, this field is computed over every 10 million bit times slot (10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.
This bit is reserved in configurations with only one transmit queue.

### Queue i interrupt control status Register (ETH_MTLQiICSR)

Address offset: 0x0D2C + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

This register contains the interrupt enable and status bits for the queue **i** interrupts.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | rw | rw | | | | | | | rw | rw |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **RXOIE**: Receive Queue Overflow Interrupt Enable

When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled.

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **RXOVFIS**: Receive Queue Overflow Interrupt Status

This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit.

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **ABPSIE**: Average Bits Per Slot Interrupt Enable

When this bit is set, the MAC asserts the eth_sbd_intr_it interrupt when the average bits per slot status is updated.
When this bit is cleared, the interrupt is not asserted for such an event.
This bit is reserved when the number of TX queues is less than 2.

Bit 8 **TXUIE**: Transmit Queue Underflow Interrupt Enable

When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **ABPSIS**: Average Bits Per Slot Interrupt Status

When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit.
This bit is reserved when the number of TX queues is less than 2.

Bit 0 **TXUNFIS**: Transmit Queue Underflow Interrupt Status

This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit.

### Rx queue i operating mode register (ETH_MTLRXQiOMR)

Address offset: 0x0D30 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0070 0000

The Queue i Receive operating Mode register establishes the Receive queue operating modes and command.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **RQS[3:0]**: Receive Queue Size

This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx queues more than one and the reset value is 0x0.

Bits 19:17 Reserved, must be kept at reset value.

| | |
|---|---|
| Bits 16:14 | **RFD[2:0]**: Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes)<br>These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation:<br>0: Full minus 1 Kbyte, that is, FULL 1 Kbyte<br>1: Full minus 1.5 Kbyte, that is, FULL 1.5 Kbyte<br>2: Full minus 2 Kbytes, that is, FULL 2 Kbytes<br>3: Full minus 2.5 Kbytes, that is, FULL 2.5 Kbytes<br>4: Full minus 2.5 Kbytes, that is, FULL 3 Kbytes<br>5: Full minus 2.5 Kbytes, that is, FULL 3.5 Kbytes<br>...<br>6: Full minus 4 Kbytes, that is, FULL 4 Kbytes<br>7: Full minus 4.5 Kbytes, that is, FULL 4.5 Kbytes<br>The de-assertion is effective only after flow control is asserted.<br>*Note: The value must be programmed in such a way to make sure that the threshold is a positive number.*<br>*When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 Kbytes.*<br>*For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 Kbyte) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register.*<br>*The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.*<br>*This field is reserved and read only when the RX FIFO size selected during configuration is less than 4Kbytes.* |
| Bits 13:11 | Reserved, must be kept at reset value. |
| Bits 10:8 | **RFA[2:0]**: Threshold for Activating Flow Control (in half-duplex and full-duplex<br>These bits control the threshold (fill-level of Rx queue) at which the flow control is activated:<br>For more information on encoding for this field, see RFD. |
| Bit 7 | **EHFC**: Enable Hardware Flow Control<br>When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. This bit is not used (reserved and always reset) when the Rx queue is less than 4 Kbytes. |
| Bit 6 | **DIS_TCP_EF**: Disable Dropping of TCP/IP Checksum Error Packets<br>When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.<br>When this bit is reset, all error packets are dropped if the FEP bit is reset. This bit is reserved and RO when Enable Receive TCP/IP Checksum Check is not selected. |
| Bit 5 | **RSF**: Receive Queue Store and Forward<br>When this bit is set, the Ethernet peripheral reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. |

| | |
|---|---|
| Bit 4 | **FEP**: Forward Error Packets<br>When this bit is reset, the Rx queue drops packets with error status (CRC error, receive error, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped.<br>When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA. |
| Bit 3 | **FUP**: Forward Undersized Good Packets<br>When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. |
| Bit 2 | Reserved, must be kept at reset value. |
| Bits 1:0 | **RTC[1:0]**: Receive Queue Threshold Control<br>These bits control the threshold level of the MTL Rx queue (in bytes):<br>00: 64<br>01: 32<br>10: 96<br>11: 128<br>The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred.<br>This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. |

### Rx queue i missed packet and overflow counter register (ETH_MTLRXQiMPOCR)

Address offset: 0x0D34 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i missed packet and overflow counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **MISCNTOVF**: Missed Packet Counter Overflow Bit
When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit.

Bits 26:16 **MISPKTCNT[10:0]**: Missed Packet Counter
This field indicates the number of packets missed by the Ethernet peripheral because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read.
This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability.

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **OVFCNTOVF**: Overflow Counter Overflow Bit
When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit.

Bits 10:0 **OVFPKTCNT[10:0]**: Overflow Packet Counter
This field indicates the number of packets discarded by the Ethernet peripheral because of Receive queue overflow. This counter is incremented each time the Ethernet peripheral discards an incoming packet because of overflow. This counter is reset when this register is read.

### Rx queue i debug register (ETH_MTLRXQiDR)

Address offset: 0x0D38 + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue i Receive Debug register gives the debug status of various blocks related to the Receive queue.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | r | r | | r | r | r |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **PRXQ[13:0]**: Number of Packets in Receive Queue

This field indicates the current number of packets in the Rx queue. The theoretical maximum value for this field is 256Kbyte/16bytes = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **RXQSTS[1:0]**: MTL Rx Queue Fill-Level Status

This field gives the status of the fill-level of the Rx queue:
00: Rx queue empty
01: Rx queue fill-level below flow-control deactivate threshold
10: Rx queue fill-level above flow-control activate threshold
11: Rx queue full

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **RRCSTS[1:0]**: MTL Rx Queue Read Controller State

This field gives the state of the Rx queue Read controller:
00: Idle state
01: Reading packet data
10: Reading packet status (or timestamp)
11: Flushing the packet data and status

Bit 0 **RWCSTS**: MTL Rx Queue Write Controller Active Status

When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx queue.

### Rx queue i control register (ETH_MTLRXQiCR)

Address offset: 0x0D3C + 0x40 * i, (i = 0 to 1)

Reset value: 0x0000 0000

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RXQ_FRM_ARBIT | RXQ_WEGT[2:0] | | |
| | | | | | | | | | | | | r | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RXQ_FRM_ARBIT**: Receive Queue Packet Arbitration

When this bit is set, the Ethernet peripheral drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue.

When this bit is reset, the Ethernet peripheral drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue:

– PBL amount of data (indicated by ari_qN_pbl_i[])

or

– complete data of a packet

The status and the timestamp are not a part of the PBL data. Therefore, the Ethernet peripheral drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode).

Bits 2:0 **RXQ_WEGT[2:0]**: Receive Queue Weight

This field indicates the weight assigned to the Rx queue 0. The weight is used as the number of continuous PBL requests or contiguous packets (depending on the RXQ_PKT_ARBIT) allocated to the queue in one arbitration cycle.

### Tx queue 1 ETS control Register (ETH_MTLTXQ1ECR)

Address offset: 0x0D50

Reset value: 0x0000 0000

The Queue ETS Control register controls the enhanced transmission selection operation.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | | | | | | | | | rw | rw | rw | rw | rw | | |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SLC[2:0]**: Slot Count

If the credit-based shaper algorithm is enabled, the software can program the number of slots (of 125 us duration) over which the average transmitted bits per slot, provided in the ETH_MTLTXQ1ESR register, need to be computed for Queue 1. The encoding is as follows:
000: 1 Slot
001: 2 Slots
010: 4 Slots
011: 8 Slots
100: 16 Slots
101-111: Reserved
If the AV feature is not selected, this field is reserved and RO.

Bit 3 **CC**: Credit Control

When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel 1. The credit accumulates even when there is no packet waiting in Channel 1 and another channel is transmitting.
When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel 1. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated.

Bit 2 **AVALG**: AV Algorithm

When Queue 1 is programmed for AV, this field configures the scheduling algorithm for this queue:
This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue 1 traffic. When reset, strict priority is selected.
If AV feature is not selected for this queue, this field is reserved and RO.

Bits 1:0 Reserved, must be kept at reset value.

### Tx queue 1 quantum weight register (ETH_MTLTXQ1QWR)

Address offset: 0x0D58

Reset value: 0x0000 0000

This register provides the average traffic transmitted on queue 1.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| ISCQW[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:0 **ISCQW[20:0]**: idleSlopeCredit value for queue 1

This field contains the idleSlopeCredit value required for queue 1 credit-based shaper algorithm. This is the credit change rate expressed in bits per cycle (typically 40 ns for 100 Mbps or 8 ns for 1000 Mbps) when the credit increases.

The software should program this field with the number of computed credit in bits per cycle scaled by 1 024. The maximum value is portTransmitRate, that is 0x2000 in 1000 Mbps mode or 0x1000 at 100 Mbps mode.

Bits 20 to 14 must be programmed at 0.

### Tx queue 1 send slope credit Register (ETH_MTLTXQ1SSCR)

Address offset: 0x0D5C

Reset value: 0x0000 0000

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | SSC[13:0] | | | | | | | | | | | | | |
| | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **SSC[13:0]**: sendSlopeCredit Value

When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns and 8 ns for 100 Mbps and 1000 Mbps respectively) when the credit decreases. The software should program this field with computed credit in bits per cycle scaled by 1 024. The maximum value is portTransmitRate, that is 0x2000 in 1000 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

This bit is reserved when the AV feature is not selected.

### Tx Queue 1 hiCredit register (ETH_MTLTXQ1HCR)

Address offset: 0x0D60

Reset value: 0x0000 0000

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| HC[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:0 **HC[28:0]**: hiCredit Value

When the AV feature is enabled, this field contains the hiCredit value required for the credit-based shaper algorithm. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1 024.

The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16 384 bytes or 131 072 bits). The value to be specified is 131 072 * 1 024 = 134 217 728 or 0x0800 0000.

### Tx queue 1 loCredit register (ETH_MTLTXQ1LCR)

Address offset: 0x0D64

Reset value: 0x0000 0000

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | LC[28:16] | | | | | | | | | | | | |
| | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| LC[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:0 **LC[28:0]**: loCredit Value

When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1 024. The maximum value is maxFrameSize transmitted from this queue, that is, 16 384 * 8 * 1 024 = 134 217 728 or 0x0800 0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800 0000.

This bit is reserved when the AV feature is not selected.

## 64.11.4 Ethernet MAC and MMC registers

### Operating mode configuration register (ETH_MACCR)

Address offset: 0x0000

Reset value: 0x0000 8000

The MAC Configuration Register establishes the operating mode of the MAC.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **ARPEN**: ARP Offload Enable

When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It will forward the ARP packet to the application and also indicate the events in the RxStatus.

When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus.

This bit is available only when the Enable IPv4 ARP Offload is selected.

Bits 30:28 **SARC[2:0]**: Source Address Insertion or Replacement Control

This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]:

0x: Reserved.

10:

- If Bit 30 is set to 0, the MAC inserts the content of the MAC Address 0 registers (MAC registers 192 and 193) in the SA field of all transmitted packets.
- If Bit 30 is set to 1 and the Enable MAC Address Register 1 option is selected while configuring the core, the MAC inserts the content of the MAC Address 1 registers (MAC registers 194 and 195) in the SA field of all transmitted packets.

11:

- If Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers (MAC registers 192 and 193) in the SA field of all transmitted packets.
- If Bit 30 is set to 1 and the MAC Address Register 1 is enabled, the MAC replaces the content of the MAC Address 1 registers (MAC registers 194 and 195) in the SA field of all transmitted packets.

*Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.*

*These bits are reserved and RO when the Enable SA and VLAN Insertion on Tx feature is not selected while configuring the core.*

Bit 27 **IPC**: Checksum Offload

When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled.

If the IP Checksum Offload feature is not enabled while configuring the core, this bit is reserved and RO (with default value).

The Layer 3 and Layer 4 Packet Filter and Enable Split Header features automatically selects the IPC Full Checksum Offload Engine on the Receive side. When any of these features are enabled, you must set the IPC bit.

Bits 26:24 **IPG[2:0]**: Inter-Packet Gap

These bits control the minimum IPG between packets during transmission.
000: 96 bit times
001: 88 bit times
010: 80 bit times
...
111: 40 bit times
This range of minimum IPG is valid in full-duplex mode.
In the half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered.
When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG.
The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in ETH_MACECR register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in ETH_MACECR register.

Bit 23 **GPSLCE**: Giant Packet Size Limit Control Enable

When this bit is set, the MAC considers the value in GPSL field in ETH_MACECR register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit.
When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet).
The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status.

Bit 22 **S2KP**: IEEE 802.3as Support for 2K Packets

When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets.
When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. For more information about how the setting of this bit and the JE bit impact the Giant packet status, see Gaint Packet Status based on S2KP and JE Bits.

*Note: When the JE bit is set, setting this bit has no effect on the giant packet status.*

Bit 21 **CST**: CRC stripping for Type packets

When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. This function is not valid when the IP Checksum Engine (Type 1) is enabled in the MAC receiver. This function is valid when Type 2 Checksum Offload Engine is enabled.

*Note: For information about how the settings of the ACS bit and this bit impact the packet length, see Packet Length based on the CST and ACS Bits.*

Bit 20 **ACS**: Automatic Pad or CRC Stripping

When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field.

When this bit is reset, the MAC passes all incoming packets to the application, without any modification.

*Note: For information about how the settings of CST bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bit.*

Bit 19 **WD**: Watchdog Disable

When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes.

When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes.

Bit 18 **BE**: Packet Burst Enable

When this bit is set, the MAC allows packet bursting during transmission in the GMII half-duplex mode. This bit is reserved and read-only (RO) in the 10/100 Mbps-only or full-duplex-only configurations.

Bit 17 **JD**: Jabber Disable

When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes.

When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet.

Bit 16 **JE**: Jumbo Packet Enable

When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status.

Bit 15 **PS**: Port Select

This bit selects the Ethernet line speed.

0: For 1000 Mbps operations

1: For 10 or 100 Mbps operations

In 10 or 100 Mbps operations, this bit, along with Bit 14, selects the exact line speed. In the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, this bit is read-only (RO) with appropriate value. In default 10/100/1000 Mbps configurations, this bit is read-write (rw). The mac_speed_o[1] signal reflects the value of this bit.

Bit 14 **FES**: MAC Speed

This bit selects the speed in the 10/100 Mbps mode:

0: 10 Mbps

1: 100 Mbps

In the 1000 Mbps-only configurations, this bit is read-only with the reset value. In the 10 or 100 Mbps-only or default 10/100/1000 Mbps configurations, this bit is read-write. The mac_speed_o[0] signal reflects the value of this bit.

Bit 13 **DM**: Duplex Mode

When this bit is set, the MAC operates in the full-duplex mode in which it can transmit and receive simultaneously. This bit is RO with default value of 1'b1 in the full-duplex-only configurations.

Bit 12 **LM**: Loopback Mode

When this bit is set, the MAC operates in the loopback mode at GMII or MII. The GMII Rx clock input (eth_mii_rx_clk) is required for the loopback to work properly. This is because the Tx clock is not internally looped back.

Bit 11 **ECRSFD**: Enable Carrier Sense Before Transmission in Full-Duplex Mode

When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the full-duplex mode. The MAC starts the transmission only when the CRS signal is low.
When this bit is reset, the MAC transmitter ignores the status of the CRS signal.

Bit 10 **DO**: Disable Receive Own

When this bit is set, the MAC disables the reception of packets when the ETH_TX_EN is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY.
This bit is not applicable in the full-duplex mode. This bit is reserved and read-only (RO) with default value in the full-duplex-only configurations.

Bit 9 **DCRS**: Disable Carrier Sense During Transmission

When this bit is set, the MAC transmitter ignores the (G)MII CRS signal during packet transmission in the half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission.
When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission.
This bit is reserved and read-only (RO) in the full-duplex-only configurations.

Bit 8 **DR**: Disable Retry

When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status.
When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the half-duplex mode. This bit is reserved and read-only (RO) in the full-duplex-only configurations.

Bit 7 Reserved, must be kept at reset value.

Bits 6:5 **BL[1:0]**: Back-Off Limit

The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision.
00: k= min (n, 10)
01: k = min (n, 8)
10: k = min (n, 4)
11: k = min (n, 1)
where - = retransmission attempt
The random integer r takes the value in the range 0 <= r < 2^k
This bit is applicable only in the half-duplex mode. This bit is reserved and read-only (RO) in the full-duplex-only configurations.

Bit 4 **DC**: Deferral Check

When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode.

If the MAC is configured for 1000 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII.

The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted.

When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive.

This bit is applicable only in the half-duplex mode. This bit is reserved and read-only (RO) in the full-duplex-only configurations.

Bits 3:2 **PRELEN[1:0]**: Preamble Length for Transmit packets

These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the full-duplex mode.

00: 7 bytes of preamble

01: 5 bytes of preamble

10: 3 bytes of preamble

11: Reserved

Bit 1 **TE**: Transmitter Enable

When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets.

Bit 0 **RE**: Receiver Enable

When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface.

*Table 529* shows how the settings of S2KP and JE bits of the ETH_MACCR register impact the giant packet status.

**Table 529. Giant Packet Status based on S2KP and JE Bits**

| Length/Type Field | Received Packet Length | S2KP | JE | Giant Packet Status |
|---|---|---|---|---|
| Untagged packet | > 1,518 | 0 | 0 | 1 |
| | > 2,000 | 1 | 0 | 1 |
| | > 9,018 | x | 1 | 1 |
| VLAN tagged packet | > 1,522 | 0 | 0 | 1 |
| | > 2,000 | 1 | 0 | 1 |
| | > 9,022 | x | 1 | 1 |
| *Note: For all other combinations, the Giant Packet status is 0.* | | | | |

*Table 530* shows how the settings of the CST and ACS bits of the ETH_MACCR register impact whether CRC length is included in the packet length.

**Table 530. Packet Length based on the CST and ACS bits**

| Receive Checksum Offload Engine | Received Packet Length | CST | ACS | FCS Stripping Done |
|---|---|---|---|---|
| IPCHKSUM_EN = 0 and IPC_FULL_OFFLOAD = 0 or IPCHKSUM_EN = 1 and IPC_FULL_OFFLOAD = 1 | < 1,536 | x | 0 | No |
| | | x | 1 | Yes (for Ethernet packets) |
| | >= 1,536 | 0 | x | No |
| | | 1 | x | Yes (for Type packets) |
| IPCHKSUM_EN = 1 and IPC_FULL_OFFLOAD = 0 | < 1,536 | x | 0 | No |
| | | x | 1 | Yes (for Ethernet packets) |
| | >= 1,536 | x | x | No |

### Extended operating mode configuration register (ETH_MACECR)

Address offset: 0x0004

Reset value: 0x0000 0000

The MAC Extended Configuration Register establishes the operating mode of the MAC.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | EIPG[4:0] | | | | | EIPGEN | Res. | Res. | Res. | Res. | Res. | USP | SPEN | DCRCC |
| | | rw | rw | rw | rw | rw | rw | | | | | | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | GPSL[13:0] | | | | | | | | | | | | | |
| | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **EIPG[4:0]**: Extended Inter-Packet Gap

The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits), along with IPG field in ETH_MACCR, gives the minimum IPG greater than 96 bit times in steps of 8 bit times:

{EIPG, IPG}

0x00:104 bit times

0x01: 112 bit times

0x02: 120 bit times

..

0xFF: 2144 bit times

Bit 24 **EIPGEN**: Extended Inter-Packet Gap Enable

When this bit is set, the MAC interprets EIPG field and IPG field in ETH_MACCR together as minimum IPG greater than 96 bit times in steps of 8 bit times.

When this bit is reset, the MAC ignores EIPG field and interprets IPG field in ETH_MACCR as minimum IPG less than or equal to 96 bit times in steps of 8 bit times.

*Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-Duplex mode only. There may be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-Duplex mode.*

Bits 23:19 Reserved, must be kept at reset value.

Bit 18 **USP**: Unicast Slow Protocol Packet Detect

When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the ETH_MACA0HR and ETH_MACA0LR registers. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02).

When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2008, Section 5.

Bit 17 **SPEN**: Slow Protocol Detection Enable

When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Rx status. The MAC discards the Slow Protocol packets with invalid sub-types.

When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets.

Bit 16 **DCRCC**: Disable CRC Checking for Received Packets

When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **GPSL[13:0]**: Giant Packet Size Limit

If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes.

For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. When the Enable Double VLAN Processing option is selected, the MAC adds 8 bytes to the programmed value for double VLAN tagged packets. The value in this field is applicable when the GPSLCE bit is set in ETH_MACCR register.

### Packet filtering control register (ETH_MACPFR)

Address offset: 0x0008

Reset value: 0x0000 0000

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **RA**: Receive All

When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word.

When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter.

Bits 30:22 Reserved, must be kept at reset value.

Bit 21 **DNTU**: Drop Non-TCP/UDP over IP Packets

When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets.

If the Enable Layer 3 and Layer 4 Packet Filter option is not selected, this bit is reserved (RO with default value).

Bit 20 **IPFE**: Layer 3 and Layer 4 Filter Enable

When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect.

When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields.

If the Enable Layer 3 and Layer 4 Packet Filter option is not selected, this bit is reserved (RO with default value).

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **VTFE**: VLAN Tag Filter Enable

When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag.

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **HPF**: Hash or Perfect Filter

When this bit is set, the address filter passes a packet if it matches either the perfect filtering or Hash filtering as set by the HMC or HUC bit.

When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter. This bit is reserved (and RO) if the Enable Address Filter Hash Table option is not selected.

Bit 9 **SAF**: Source Address Filter Enable

When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet.

When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison.

*Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA.*

Bit 8 **SAIF**: SA Inverse Filtering

When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter.

When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter.

Bits 7:6 **PCF[1:0]**: Pass Control Packets

These bits control the forwarding of all control packets (including unicast and multicast Pause packets).

00: The MAC filters all control packets from reaching the application.

01: The MAC forwards all control packets except Pause packets to the application even if they fail the Address filter.

10: The MAC forwards all control packets to the application even if they fail the Address filter.

11: The MAC forwards the control packets that pass the Address filter.

Bit 5 **DBF**: Disable Broadcast Packets

When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings.

When this bit is reset, the AFM module passes all received broadcast packets.

Bit 4 **PM**: Pass All Multicast

When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit.

Bit 3 **DAIF**: DA Inverse Filtering

When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed.

Bit 2 **HMC**: Hash Multicast

When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the Hash table.

When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers.

If the Enable Address Filter Hash Table option is not selected, this bit is reserved (and RO).

Bit 1 **HUC**: Hash Unicast

When this bit is set, the MAC performs the destination address filtering of unicast packets according to the Hash table.

When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers.

If the Enable Address Filter Hash Table option is not selected, this bit is reserved (and RO).

Bit 0 **PR**: Promiscuous Mode

When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set.

### Watchdog timeout register (ETH_MACWTR)

Address offset: 0x000C

Reset value: 0x0000 0000

The Watchdog Timeout register controls the watchdog timeout for received packets.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | PWE | Res. | Res. | Res. | Res. | WTO[3:0] | | | |
| | | | | | | | rw | | | | | rw | rw | rw | rw |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PWE**: Programmable Watchdog Enable

When this bit is set and the WD bit of the ETH_MACCR register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in ETH_MACCR register.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **WTO[3:0]**: Watchdog Timeout

When the PWE bit is set and the WD bit of the ETH_MACCR register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet.

Encoding is as follows:

0x0: 2 Kbytes
0x1: 3 Kbytes
0x2: 4 Kbytes
0x3: 5 Kbytes
..
0xC: 14 Kbytes
0xD: 15 Kbytes
0xE: 16383 Bytes
0xF: Reserved

*Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped.*

### Hash Table 0 register (ETH_MACHT0R)

Address offset: 0x0010

Reset value: 0x0000 0000

The Hash Table Register 0 contains the first 32 bits of the Hash table (64 bits).

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1).

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

If the Hash Table register is configured to be double-synchronized to the GMII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| HT31T0[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **HT31T0[31:0]**: MAC Hash Table First 32 Bits

This field contains the first 32 Bits [31:0] of the Hash table.

### Hash Table 1 register (ETH_MACHT1R)

Address offset: 0x0014

Reset value: 0x0000 0000

The Hash Table Register 1contains the last 32 bits of the Hash table (64 bits).

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1).

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

If the Hash Table register is configured to be double-synchronized to the GMII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **HT63T32[31:0]**: MAC Hash Table Second 32 Bits

This field contains the second 32 Bits [63:32] of the Hash table.

### VLAN tag register (ETH_MACVTR)

Address offset: 0x0050

Reset value: 0x0000 0000

The VLAN Tag register identifies the IEEE 802.1Q VLAN type packets.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| rw | | rw | rw | rw | rw | rw | rw | | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| VL[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **EIVLRXS**: Enable Inner VLAN Tag in Rx Status

When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status.

Bit 30 Reserved, must be kept at reset value.

Bits 29:28 **EIVLS[1:0]**: Enable Inner VLAN Tag Stripping on Receive

This field indicates the stripping operation on inner VLAN Tag in received packet:
00: Do not strip
01: Strip if VLAN filter passes
10: Strip if VLAN filter fails
11: Always strip

Bit 27 **ERIVLT**: Enable Inner VLAN Tag

When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). The ERSVLM bit determines which VLAN type is enabled for filtering or matching.

Bit 26 **EDVLP**: Enable Double VLAN Processing

When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present).

Bit 25 **VTHM**: VLAN Tag Hash Table Match Enable

When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the ETH_MACVLANHTR register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN Hash table.
When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison.
When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison.
When this bit is reset, the VLAN Hash Match operation is not performed. If the VLAN Hash feature is not enabled, this bit is reserved (RO with default value).

Bit 24 **EVLRXS**: Enable VLAN Tag in Rx status

When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status.

Bit 23 Reserved, must be kept at reset value.

Bits 22:21 **EVLS[1:0]**: Enable VLAN Tag Stripping on Receive

This field indicates the stripping operation on the outer VLAN Tag in received packet:
00: Do not strip
01: Strip if VLAN filter passes
10: Strip if VLAN filter fails
11: Always strip

Bit 20 **DOVLTC**: Disable VLAN Type Check

When this bit is set, the MAC does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN.
When this bit is reset, the MAC filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit.

Bit 19 **ERSVLM**: Enable Receive S-VLAN Match

When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.
The ERIVLT bit determines the VLAN tag position considered for filtering or matching.

Bit 18 **ESVL**: Enable S-VLAN

When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets.

Bit 17 **VTIM**: VLAN Tag Inverse Match Enable

When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched.

Bit 16 **ETV**: Enable 12-Bit VLAN Tag Comparison

When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. Similarly, when enabled, only 12 bits of the VLAN tag in the received packet are used for Hash-based VLAN filtering.
When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for comparison and VLAN Hash filtering.

Bits 15:0 **VL[15:0]**: VLAN Tag Identifier for Receive Packets

This field contains the 802.1Q VLAN tag to identify the VLAN packets. This VLAN tag identifier is compared to the 15th and 16th bytes of the packets being received for VLAN packets. The following list describes the bits of this field:
Bits[15:13]: User Priority
Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)
Bits[11:0]: VLAN Identifier (VID) field of VLAN tag
When the ETV bit is set, only the VID is used for comparison.
If this field ([11:0] if ETV is set) is all zeros, the MAC does not check the 15th and 16th bytes for VLAN tag comparison and declares all packets with Type field value of 0x8100 or 0x88a8 as VLAN packets.

### VLAN Hash table register (ETH_MACVHTR)

Address offset: 0x0058

Reset value: 0x0000 0000

When the ERSVLM bit of ETH_MACHT1R register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For Hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of ETH_MACVTR register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. For example, a Hash value of 1000 selects Bit 8 of the VLAN Hash table.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3).
2. Perform bitwise reversal for the value obtained in step 1.
3. Take the upper four bits from the value obtained in step 2.

If the VLAN Hash Table register is configured to be double-synchronized to the GMII clock domain, the synchronization is triggered only when Bits[15:8] (in little-endian mode) or Bits[7:0] (in big-endian mode) of this register are written.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **VLHT[15:0]**: VLAN Hash Table
This field contains the 16-bit VLAN Hash Table.

### VLAN inclusion register (ETH_MACVIR)

Address offset: 0x0060

Reset value: 0x0000 0000

The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the Transmit packets. It also contains the VLAN tag insertion controls.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| VLT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **VLTI**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor.

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, bits[17:16] are ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

00: No VLAN tag deletion, insertion, or replacement

01: VLAN tag deletion. The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags.

10: VLAN tag insertion. The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.

11: VLAN tag replacement. The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8).

*Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.*

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag.

The following list describes the bits of this field:

Bits[15:13]: User Priority

Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)

Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

### Inner VLAN inclusion register (ETH_MACIVIR)

Address offset: 0x0064

Reset value: 0x0000 0000

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| VLT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **VLTI**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the VLC field is used for VLAN deletion, insertion, or replacement. When this bit is reset, the VLC field is ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

00: No VLAN tag deletion, insertion, or replacement

01: VLAN tag deletion

The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags.

10: VLAN tag insertion

The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.

11: VLAN tag replacement

The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8).

*Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.*

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag.

The following list describes the bits of this field:

Bits[15:13]: User Priority

Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)

Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

### Tx Queue 0 flow control register (ETH_MACQ0TXFCR)

Address offset: 0x0070

Reset value: 0x0000 0000

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DZPQ | PLT[2:0] | | | Res. | Res. | TFE | FCB_BPA |
| | | | | | | | | rw | rw | rw | rw | | | rw | rw |

Bits 31:16 **PT[15:0]**: Pause Time

This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **DZPQ**: Disable Zero-Quanta Pause

When this bit is set, it disables the automatic generation of the zero-quanta Pause packets. When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled.

Bits 6:4 **PLT[2:0]**: Pause Low Threshold

This field configures the threshold of the Pause timer at which the input flow is checked for automatic retransmission of the Pause packet.

The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted at 228 (256-28) slot times after the first Pause packet is transmitted.

The following list provides the threshold values for different values:

000: Pause Time minus 4 Slot Times (PT -4 slot times)

001: Pause Time minus 28 Slot Times (PT -28 slot times)

010: Pause Time minus 36 Slot Times (PT -36 slot times)

011: Pause Time minus 144 Slot Times (PT -144 slot times)

100: Pause Time minus 256 Slot Times (PT -256 slot times)

101: Pause Time minus 512 Slot Times (PT -512 slot times)

110-111: Reserved

The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface.

This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **TFE**: Transmit Flow Control Enable

**Full-Duplex Mode:** when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets.

**Half-Duplex Mode:** when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled.

Bit 0 **FCB_BPA**: Flow Control Busy or Backpressure Activate

This bit initiates a Pause packet in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set.

**Full-Duplex Mode:** this bit should be read as 0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 0. You should not write to this register until this bit is cleared.

**Half-Duplex Mode:** When this bit is set (and TFE bit is set) in the half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled.

### Rx flow control register (ETH_MACRXFCR)

Address offset: 0x0090

Reset value: 0x0000 0000

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | | | | | | | | | | | | | | rw | rw |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **UP**: Unicast Pause Packet Detect

A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in ETH_MACA0HR and ETH_MACA0LR.

When this bit is reset, the MAC only detects Pause packets with unique multicast address.

*Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011.*

Bit 0 **RFE**: Receive Flow Control Enable

When this bit is set and the MAC is operating in full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in half-duplex mode, the decode function of the Pause packet is disabled.

When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time.

### Tx queue priority mapping 0 register (ETH_MACTXQPMR)

Address offset: 0x0098

Reset value: 0x0000 0000

The transmit queue priority mapping 0 register contains the priority values assigned to Tx queue 0 and tx queue 1.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **PSTQ1[7:0]**: Priorities Selected in Transmit Queue 1

This field holds the priorities assigned to Tx queue 1 by software. It determines if Tx queue 1 is blocked from transmitting during a specific pause time when a PFC packet is received with a priority that matches the priority programmed in this field.

If the content of this field is the same as Queue 0, the MAC blocks the two queues for a specific period of time.

Bits 7:0 **PSTQ0[7:0]**: Priorities Selected in Transmit Queue 0

This bit is similar to the PSTQ1 bit.

### Rx queue control 0 register (ETH_MACRXQC0R)

Address offset: 0x00A0

Reset value: 0x0000 0000

The Receive Queue Control 0 register controls the queue management in the MAC Receiver.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:2 **RXQ1EN[1:0]**: Receive Queue 1 Enable
This field is similar to the RXQ0EN field.

Bits 1:0 **RXQ0EN[1:0]**: Receive Queue 0 Enable
This field indicates whether Rx queue 0 is enabled for AV.
00: Not enabled
01: Queue 0 enabled for AV
Others: Reserved

### Rx queue control 1 register (ETH_MACRXQC1R)

Address offset: 0x00A4

Reset value: 0x0000 0000

The Receive Queue Control 1 register controls queue 1 management in the MAC receiver.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **TACPQE**: Tagged AV Control Packets Queuing Enable.
When set, the MAC routes the received Tagged AV control packets to the Rx queue specified by AVCPQ field.
When reset, the MAC routes the received Tagged AV control packets based on the tag priority matching the PSRQ fields in ETH_MACRXQC2R and ETH_MACRXQC3R registers.
This field is reserved if Rx queues are not selected for AV feature.

Bit 20 **MCBCQEN**: Multicast and Broadcast Queue Enable
This bit specifies that Multicast or Broadcast packets routing to the Rx queue is enabled and the Multicast or Broadcast packets must be routed to Rx queue specified in MCBCQ field.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **MCBCQ[2:0]**: Multicast and Broadcast Queue
This field specifies the Rx queue onto which Multicast or Broadcast Packets are routed. Any Rx queue enabled for Generic/DCB/AV traffic can be used to route the Multicast or Broadcast Packets.
000: Rx queue 0
001: Rx queue 1
Others: Reserved

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **UPQ[2:0]**: Untagged Packet Queue
This field indicates the Rx queue to which Untagged Packets are to be routed. Any Rx queue enabled for Generic/DCB/AV traffic can be used to route the Untagged Packets.
000: Rx queue 0
001: Rx queue 1
Others: Reserved

Bits 11:7 Reserved, must be kept at reset value.

Bits 6:4 **AVPTPQ[2:0]**: AV PTP Packets Queue
This field specifies the Rx queue on which the PTP packets sent over the Ethernet payload (not over IPv4 or IPv6) are routed.
000: Rx queue 0
001: Rx queue 1
Others: Reserved
When the AV8021ASMEN bit of ETH_MACTSCR register is set, only untagged PTP over Ethernet packets are routed on an Rx queue. This field is reserved if Rx queues are not selected for AV feature.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **AVCPQ[2:0]**: AV Untagged Control Packets Queue
This field specifies the Receive queue on which the received AV untagged control packets are routed:
000: Receive Queue 0
001: Receive Queue 1
Others: Reserved
The AV tagged control and data packets are routed based on PSRQ field in the Transmit Flow Control Register of corresponding queue.
This field is reserved if Receive queues are not selected for AV feature.

### Rx queue control 2 register (ETH_MACRXQC2R)

Address offset: 0x00A8

Reset value: 0x0000 0000

This register controls the routing of tagged packets based on the USP (user priority) field of the received packets to the Rx queue 0 and 1.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:15 Reserved, must be kept at reset value.

Bits 15:8 **PSRQ1[7:0]**: Priorities Selected in the Receive Queue 1

This field defines the priorities assigned to Rx queue 1. All packets with priorities that match the values set in this field are routed to Rx queue 1.

For example, if PSRQ1[4] is set, packets with USP field equal to 4 are routed to Rx queue 1. The software must ensure that the content of this

field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues.

Bits 7:0 **PSRQ0[7:0]**: Priorities Selected in the Receive Queue 0

This field defines the priorities assigned to Rx queue 0. All packets with priorities that match the values set in this field are routed to Rx queue 0.

For example, if PSRQ0[5] is set, packets with USP field equal to 5 are routed to Rx queue 0. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues.

### Interrupt status register (ETH_MACISR)

Address offset: 0x00B0

Reset value: 0x0000 0000

The Interrupt Status register contains the status of interrupts.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | RXSTSIS | TXSTSIS | TSIS | Res. | MMCTXIS | MMCRXIS | MMCIS | Res. | Res. | LPIIS | PMTIS | PHYIS | Res. | Res. | RGSMIIIS |
| | r | r | r | | r | r | r | | | r | r | r | | | r |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RXSTSIS**: Receive Status Interrupt

This bit indicates the status of received packets. This bit is set when the RWT bit is set in the ETH_MACISR register. This bit is cleared when the corresponding interrupt source bit is read in the ETH_MACISR register.

Bit 13 **TXSTSIS**: Transmit Status Interrupt

This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the ETH_MACISR register:

- Excessive Collision (EXCOL)
- Late Collision (LCOL)
- Excessive Deferral (EXDEF)
- Loss of Carrier (LCARR)
- No Carrier (NCARR)
- Jabber Timeout (TJT)

This bit is cleared when the corresponding interrupt source bit is read in the ETH_MACISR register.

Bit 12 **TSIS**: Timestamp Interrupt Status

If the Timestamp feature is enabled, this bit is set when any of the following conditions is true:

- The system time value is equal to or exceeds the value specified in the Target Time High and Low registers.
- There is an overflow in the Seconds register.
- The Target Time Error occurred, that is, programmed target time already elapsed.

If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted.

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the ETH_MACTXTSSNR and ETH_MACTXTSSSR registers.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the ETH_MACTXTSSNR and ETH_MACTXTSSSR registers, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the corresponding interrupt source bit is read in the ETH_MACTSSR register.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **MMCTXIS**: MMC Transmit Interrupt Status

This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared.

This bit is valid only when you select the Enable MAC Management Counters (MMC) option.

Bit 9 **MMCRXIS**: MMC Receive Interrupt Status

This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared.

This bit is valid only when you select the Enable MAC Management Counters (MMC) option.

Bit 8 **MMCIS**: MMC Interrupt Status

This bit is set high when Bit 11, Bit 10, or Bit 9 is set high. This bit is cleared only when all these bits are low. This bit is valid only when you select the Enable MAC Management Counters (MMC) option.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **LPIIS**: LPI Interrupt Status

When the Energy Efficient Ethernet feature is enabled, this bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared when the TLPIEN bit of ETH_MACLCSR register is read. In all other modes, this bit is reserved.

Bit 4 **PMTIS**: PMT Interrupt Status

This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in ETH_MACPCSR register). This bit is cleared when Bits[6:5] are cleared because of a Read operation to the ETH_MACPCSR register.

This bit is valid only when you select the Enable Power Management option.

Bit 3 **PHYIS**: PHY Interrupt

This bit is set when rising edge is detected on the phy_intr_i input. This bit is cleared when this register is read.

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RGSMIIIS**: RGMII or SMII Interrupt Status

This bit is set by any change in value of the Link Status of RGMII or SMII interface (LNKSTS bit in ETH_MACPHYCSR register). This bit is cleared when the ETH_MACPHYCSR register is read.

This bit is valid only when you select the optional RGMII or SMII PHY interface.

### Interrupt enable register (ETH_MACIER)

Address offset: 0x00B4

Reset value: 0x0000 0000

The Interrupt Enable register contains the masks for generating the interrupts.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | RXSTSIE | TXSTSIE | TSIE | Res. | Res. | Res. | Res. | Res. | Res. | LPIIE | PMTIE | PHYIE | Res. | Res. | RGSMIIIE |
| | rw | rw | rw | | | | | | | rw | rw | rw | | | rw |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RXSTSIE**: Receive Status Interrupt Enable
When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the ETH_MACISR register.

Bit 13 **TXSTSIE**: Transmit Status Interrupt Enable
When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the ETH_MACISR register.

Bit 12 **TSIE**: Timestamp Interrupt Enable
When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in ETH_MACISR register.
This bit is valid only when the Enable IEEE 1588 Timestamp Support option is selected. Otherwise, this bit is reserved.

Bits 11:6 Reserved, must be kept at reset value.

Bit 5 **LPIIE**: LPI Interrupt Enable
When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in ETH_MACISR register.
This bit is valid only when the Enable Energy Efficient Ethernet (EEE) option is selected. Otherwise, this bit is reserved.

Bit 4 **PMTIE**: PMT Interrupt Enable
When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in ETH_MACISR register.

Bit 3 **PHYIE**: PHY Interrupt Enable
When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in ETH_MACISR register.

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RGSMIIIE**: RGMII or SMII Interrupt Enable
When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in ETH_MACISR register.

### Rx Tx status register (ETH_MACRXTXSR)

Address offset: 0x00B8

Reset value: 0x0000 0000

The Receive Transmit Status register contains the Receive and Transmit Error status.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | RWT | Res. | Res. | EXCOL | LCOL | EXDEF | LCARR | NCARR | TJT |
| | | | | | | | r | | | r | r | r | r | r | r |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **RWT**: Receive Watchdog Timeout

This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the ETH_MACCR register. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the ETH_MACCR register.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **EXCOL**: Excessive Collisions

When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the ETH_MACCR register, this bit is set after the first collision and the packet transmission is aborted.

Bit 4 **LCOL**: Late Collision

When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode).

This bit is not valid if the Underflow error occurs.

Bit 3 **EXDEF**: Excessive Deferral

When the DTXSTS bit is set in the MTL_Operation_Mode register and the DC bit is set in the ETH_MACCR register, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000 Mbps mode or when Jumbo packet is enabled).

Bit 2 **LCARR**: Loss of Carrier

When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the loss of carrier occurred during packet transmission, that is, the phy_crs_i signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision.

Bit 1 **NCARR**: No Carrier

When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission.

Bit 0 **TJT**: Transmit Jabber Timeout

This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the ETH_MACCR register. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the ETH_MACCR register.

### PMT control status register (ETH_MACPCSR)

Address offset: 0x00C0

Reset value: 0x0000 0000

The PMT Control and Status Register is present only when you select the PMT module in coreConsultant.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RWKFILTRST | Res. | Res. | RWKPTR[4:0] | | | | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw | | | r | r | r | r | r | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | RWKPFE | GLBLUCAST | Res. | Res. | RWKPRCVD | MGKPRCVD | Res. | Res. | RWKPKTEN | MGKPKTEN | PWRDWN |
| | | | | | rw | rw | | | r | r | | | rw | rw | rw |

Bit 31 **RWKFILTRST**: Remote wakeup Packet Filter Register Pointer Reset

When this bit is set, the remote wakeup packet filter register pointer is reset to 3'b000. It is automatically cleared after 1 clock cycle.

Bits 30:29 Reserved, must be kept at reset value.

Bits 28:24 **RWKPTR[4:0]**: Remote wakeup FIFO Pointer

This field gives the current value (0 to 7) of the Remote wakeup Packet Filter register pointer. When the value of this pointer is equal to 7, the contents of the Remote wakeup Packet Filter Register are transferred to the eth_mii_rx_clk domain when a Write occurs to that register.

Bits 23:11 Reserved, must be kept at reset value.

Bit 10 **RWKPFE**: Remote wakeup Packet Forwarding Enable

When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected wakeup frame. All frames after that event including the received wakeup frame are forwarded to application. This bit is then self-cleared on receiving the wakeup packet.

The application can also clear this bit before the expected wakeup frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set

high.

*Note: If Magic Packet Enable and wakeup Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wakeup frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application.*

Bit 9 **GLBLUCAST**: Global Unicast

When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wakeup packet.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **RWKPRCVD**: Remote wakeup Packet Received

When this bit is set, it indicates that the power management event is generated because of the reception of a remote wakeup packet. This bit is cleared when this register is read.

Bit 5 **MGKPRCVD**: Magic Packet Received

When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read.

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **RWKPKTEN**: Remote wakeup Packet Enable

When this bit is set, a power management event is generated when the MAC receives a remote wakeup packet.

Bit 1 **MGKPKTEN**: Magic Packet Enable

When this bit is set, a power management event is generated when the MAC receives a magic packet.

Bit 0 **PWRDWN**: Power Down

When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wakeup packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wakeup packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote wakeup Packet Enable bit is set high.

*Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit.*

### Remote wakeup packet filter register (ETH_MACRWKPFR)

Address offset: 0x00C4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| MACRWKPFR[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MACRWKPFR[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MACRWKPFR[31:0]**: Remote wakeup packet filter
Refer to *Table 531* and *Table 532* for details on register content and programming sequence.

The ETH_MACRWKPFR register at address 0x00C4 loads the wakeup Packet Filter register.

To load values in a wakeup Packet Filter register, the entire register (ETH_MACRWKPFR) must be written. The ETH_MACRWKPFR register is loaded by sequentially loading the eight, sixteen or thirty two register values in address (0x00C4) for ETH_MACRWKPFR value 0 to 7, respectively. The ETH_MACRWKPFR register is read in a similar way. The Ethernet peripheral updates the ETH_MACRWKPFR register current pointer value in Bits[26:24] of ETH_MACPCSR register.

**Table 531. Remote wakeup packet filter register**

| ETH_MACRWKPFR value # | Field | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 0 | Filter 0 byte mask | | | | | | | |
| 1 | Filter 1 byte mask | | | | | | | |
| 2 | Filter 2 byte mask | | | | | | | |
| 3 | Filter 3 byte mask | | | | | | | |
| 4 | Reserved | Filter 3 command | Reserved | Filter 2 command | Reserved | Filter 1 command | Reserved | Filter 0 command |
| 5 | Filter 3 offset | | Filter 2 offset | | Filter 1 offset | | Filter 0 offset | |
| 6 | Filter 1 CRC - 16 | | | | Filter 0 CRC - 16 | | | |
| 7 | Filter 3 CRC - 16 | | | | Filter 2 CRC - 16 | | | |

**Table 532. ETH_MACRWKPFR**

| Register | Description |
|---|---|
| Filter *i* Byte mask | The filter *i* byte mask register defines the bytes of the packet that are examined by filter *i* (0, 1, 2 or 3) to determine whether or not a packet is a wakeup packet.<br>– The MSB (31st bit) must be zero.<br>– Bit j[30:0] is the byte mask.<br>– If Bit j (byte number) of the byte mask is set, the CRC block processes the Filter *i* Offset + j of the incoming packet; otherwise Filter *i* Offset + j is ignored. |
| Filter *i* Command | The 4-bit filter *i* command controls the filter *i* operation.<br>– Bit 3 specifies the address type, defining the destination address type of the pattern.<br>When the bit is set, the pattern applies to only multicast packets; when the bit is reset, the pattern applies only to unicast packet.<br>– Bit 2 (Inverse mode), when set, reverses the logic of the CRC16 Hash function signal, to reject a packet with matching CRC_16 value.<br>Bit 2, along with Bit 1, allows a MAC to reject a subset of remote wakeup packets by creating filter logic such as "Pattern 1 AND NOT Pattern 2".<br>– Bit 1 (And_Previous) implements the Boolean logic.<br>When set, the result of the current entry is logically ANDed with the result of the previous filter. This AND logic allows a filter pattern longer than 32 bytes by splitting the mask among two, three, or four filters. This depends on the number of filters that have the And_Previous bit set.<br>– Bit 0 is the enable for filter *i*. If Bit 0 is not set, filter *i* is disabled. |
| Filter *i* Offset | This filter *i* offset register defines the offset (within the packet) from which the filter *i* examines the packets.<br>– This 8-bit pattern-offset is the offset for the filter *i* first byte to be examined.<br>– The minimum allowed offset is 12, which refers to the 13th byte of the packet.<br>– The offset value 0 refers to the first byte of the packet. |
| Filter *i* CRC-16 | This filter *i* CRC-16 register contains the CRC_16 value calculated from the pattern and also the byte mask programmed to the wakeup filter register block.<br>– The 16-bit CRC calculation uses the following polynomial:<br>G(x) = x^16 + x^15 + x^2 + 1<br>Each mask, used in the Hash function calculation, is compared with a 16-bit value associated with that mask. Each filter has the following:<br>– 32-bit Mask: Each bit in this mask corresponds to one byte in the detected packet. If the bit is 1', the corresponding byte is taken into the CRC16 calculation.<br>– 8-bit Offset Pointer: Specifies the byte to start the CRC16 computation.<br>The pointer and the mask are used together to locate the bytes to be used in the CRC16 calculations. |

The below table lists the remote wakeup scenarios in which PMT interrupt is generated.

**Table 533. Remote Wakeup Packet and PMT Interrupt Generation(1)**

| Filter i Command | | | Frame Type and CRC Status | | Interrupt Generation |
|---|---|---|---|---|---|
| CAST | INV | EN | Received Frame Cast Type | CRC Status | RWK INTR |
| 0 | 0 | 1 | Unicast | MATCH | Remote Wakeup packet is detected and PMT interrupt is generated |
| 0 | 1 | 1 | Unicast | MISMATCH | Remote Wakeup packet is detected and PMT interrupt is generated |
| 1 | 0 | 1 | Multicast | MATCH | Remote Wakeup packet is detected and PMT interrupt is generated |
| 1 | 1 | 1 | Multicast | MISMATCH | Remote Wakeup packet is detected and PMT interrupt is generated |

1. In all other combinations, the Remote Wakeup packet is not detected and PMT interrupt is not generated.

### LPI control status register (ETH_MACLCSR)

Address offset: 0x00D0

Reset value: 0x0000 0000

The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LPITE | LPITXA | PLSEN | PLS | LPIEN |
| | | | | | | | | | | | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | RLPIST | TLPIST | Res. | Res. | Res. | Res. | RLPIEX | RLPIEN | TLPIEX | TLPIEN |
| | | | | | | r | r | | | | | r | r | r | r |

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **LPITE**: LPI Timer Enable

This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPITE, LPITXA and LPITXEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the ETH_MACLETR register.

After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPITXEN bit. This enables the re-entry into LPI state when it is IDLE again.

When LPITE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPITXEN bit descriptions.

Bit 19 **LPITXA**: LPI Tx Automate

This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side.

If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of ETH_MTLTxQiOMR, when the MAC is in the LPI mode, it exits the LPI mode.

When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode.

Bit 18 **PLSEN**: PHY Link Status Enable

This bit enables the link status received on the RGMII Receive paths to be used for activating the LPI LS TIMER.

When this bit is set, the MAC uses the link-status bits of the ETH_MACPHYCSR register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the ETH_MACPHYCSR register and takes only the PLS bit.

This bit is RO and reserved if you have not selected the RGMII PHY interface.

Bit 17 **PLS**: PHY Link Status

This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER.

When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down.

Bit 16 **LPIEN**: LPI Enable

When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission.

This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission.

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **RLPIST**: Receive LPI State

When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII or MII interface.

Bit 8 **TLPIST**: Transmit LPI State

When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface.

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **RLPIEX**: Receive LPI Exit

When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register.

*Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.*

Bit 2 **RLPIEN**: Receive LPI Entry

When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register.

*Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.*

Bit 1 **TLPIEX**: Transmit LPI Exit

When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register.

Bit 0 **TLPIEN**: Transmit LPI Entry

When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register.

### LPI timers control register (ETH_MACLTCR)

Address offset: 0x00D4

Reset value: 0x03E8 0000

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| TWT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **LST[9:0]**: LPI LS Timer

This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.

Bits 15:0 **TWT[15:0]**: LPI TW Timer

This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

### LPI entry timer register (ETH_MACLETR)

Address offset: 0x00D8

Reset value: 0x0000 0000

The LPI Entry Timer Register is used to store the LPI Idle Timer Value in Micro-Seconds.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:3 **LPIET[16:0]**: LPI Entry Timer

This field specifies the time in microseconds the MAC will wait to enter LPI mode, after it has transmitted all the frames. This field is valid and used only when LPITE and LPITXA are set to 1.

Bits [2:0] are read-only so that the granularity of this timer is in steps of 8 micro-seconds.

Bits 2:0 Reserved, must be kept at reset value.

### 1-microsecond-tick counter register (ETH_MAC1USTCR)

Address offset: 0x00DC

Reset value: 0x0000 0000

This register controls the generation of the Reference time (1-microsecond tick) for all the LPI timers. This timer has to be programmed by the software initially.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **TIC_1US_CNTR[11:0]**: 1 µs tick Counter

The application must program this counter so that the number of clock cycles of CSR clock is 1 µs.

(Subtract 1 from the value before programming).

For example if the CSR clock is 100 MHz then this field needs to be programmed to 100 - 1 = 99 (which is 0x63).

This is required to generate the 1 µs events that are used to update some of the EEE related counters.

### PHYIF control status register (ETH_MACPHYCSR)

Address offset: 0x00F8

Reset value: 0x0000 0000

The PHY Interface Control and Status register indicates the status signals received by the, RGMII interface from the PHY.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | rw | rw |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **FALSCARDET**: False Carrier Detected

This bit indicates whether the SMII PHY detected false carrier (1'b1). This bit is reserved when the MAC is configured for the SGMII or RGMII PHY interface.

Bit 20 **JABTO**: Jabber Timeout

This bit indicates the jabber timeout error (1'b1) in the received packet. This bit is reserved when the MAC is configured for the SGMII or RGMII PHY interface.

Bit 19 **LNKSTS**: Link Status

This bit indicates whether the link is up (1'b1) or down (1'b0).

Bits 18:17 **LNKSPEED[1:0]**: Link Speed

This bit indicates the current speed of the link:
00: 2.5 MHz
01: 25 MHz
10: 125 MHz

Bit 16 **LNKMOD**: Link Mode

This bit indicates the current operating mode of the link:
0: Half-duplex mode
1: Full-duplex mode

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **LUD**: Link Up or Down

This bit indicates whether the link is up or down during transmission of configuration in the RGMII, SGMII, or SMII interface:

0: Link Down

1: Link Up

This bit is reserved (RO with default value) and is enabled when the RGMII, SGMII, or SMII interface is enabled during core configuration.

Bit 0 **TC**: Transmit Configuration in RGMII, SGMII, or SMII

When set, this bit enables the transmission of duplex mode, link speed, and link up or down information to the PHY in the RGMII, SMII, or SGMII port. When this bit is reset, no such information is driven to the PHY (see *Section 64.6.3: Reduced media independent interface (RMII)*).

### Version register (ETH_MACVR)

Address offset: 0x0110

Reset value: 0x0000 4042

The version register identifies the version of the Ethernet peripheral.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **USERVER[7:0]**: ST-defined version

Bits 7:0 **SNPSVER[7:0]**: IP version

### Debug register (ETH_MACDR)

Address offset: 0x0114

Reset value: 0x0000 0000

The Debug register provides the debug status of various MAC blocks.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | r | r | r |

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:17 **TFCSTS[1:0]**: MAC Transmit Packet Controller Status

This field indicates the state of the MAC Transmit Packet Controller module:

00: Idle state

01: Waiting for one of the following:

- Status of the previous packet OR
- IPG or backoff period to be over

10: Generating and transmitting a Pause control packet (in full-duplex mode)

11: Transferring input packet for transmission

Bit 16 **TPESTS**: MAC GMII or MII Transmit Protocol Engine Status

When this bit is set, it indicates that the MAC GMII or MII transmit protocol engine is actively transmitting data, and it is not in the Idle state.

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:1 **RFCFCSTS[1:0]**: MAC Receive Packet Controller FIFO Status

When this bit is set, this field indicates the active state of the small FIFO Read and Write controllers of the MAC Receive Packet Controller module.

Bit 0 **RPESTS**: MAC GMII or MII Receive Protocol Engine Status

When this bit is set, it indicates that the MAC GMII or MII receive protocol engine is actively receiving data, and it is not in the Idle state.

### HW feature 1 register (ETH_MACHWF1R)

Address offset: 0x0120

Reset value: 0x1114 1945

This register indicates the presence of second set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 Reserved, must be kept at reset value.

Bits 30:27 **L3L4FNUM[3:0]**: Total number of L3 or L4 Filters
This field indicates the total number of L3 or L4 filters:
0000: No L3 or L4 Filter
0001: 1 L3 or L4 Filter
0010: 2 L3 or L4 Filters
..
1000: 8 L3 or L4

Bit 26 Reserved, must be kept at reset value.

Bits 25:24 **HASHTBLSZ[1:0]**: Hash Table Size
This field indicates the size of the Hash table:
00: No Hash table
01: 64
10: 128
11: 256

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **AVSEL**: AV Feature Enable
This bit is set to 1 when the Enable Audio Video Bridging option is selected.

Bit 19 **DBGMEMA**: DMA Debug Registers Enable
This bit is set to 1 when the Debug Mode Enable option is selected

Bit 18 **TSOEN**: TCP Segmentation Offload Enable
This bit is set to 1 when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected

Bit 17 **SPHEN**: Split Header Feature Enable
This bit is set to 1 when the Enable Split Header Structure option is selected

Bit 16 **DCBEN**: DCB Feature Enable
This bit is set to 1 when the Enable Data Center Bridging option is selected

Bits 15:14 **ADDR64[1:0]**: Address width
This field indicates the configured address width.
00: 32 bits
Others: Reserved

Bit 13 **ADVTHWORD**: IEEE 1588 High Word Register Enable
This bit is set to 1 when the Add IEEE 1588 Higher Word Register option is selected

Bit 12 **PTOEN**: PTP Offload Enable
This bit is set to 1 when the Enable PTP Timestamp Offload Feature is selected.

Bit 11 **OSTEN**: One-Step Timestamping Enable
This bit is set to 1 when the Enable One-Step Timestamp Feature is selected.

Bits 10:6 **TXFIFOSIZE[4:0]**: MTL Transmit FIFO Size
This field contains the configured value of MTL Tx FIFO in bytes expressed as Log to base 2 minus 7, that is, Log2(TXFIFO_SIZE) -7:
00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011-11111: Reserved

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **RXFIFOSIZE[4:0]**: MTL Receive FIFO Size
This field contains the configured value of MTL Rx FIFO in bytes expressed as Log to base 2 minus 7, that is, Log2(RXFIFO_SIZE) -7:
00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32,767 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011: 256 Kbytes
01100-11111: Reserved

### HW feature 2 register (ETH_MACHWF2R)

Address offset: 0x0124

Reset value: 0x4104 0041

This register indicates the presence of third set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **AUXSNAPNUM[2:0]**: Number of Auxiliary Snapshot Inputs
This field indicates the number of auxiliary snapshot inputs:
000: No auxiliary input
001: 1 auxiliary input
010: 2 auxiliary inputs
011: 3 auxiliary inputs
100: 4 auxiliary inputs
101-111: Reserved

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **PPSOUTNUM[2:0]**: Number of PPS Outputs
This field indicates the number of PPS outputs:
000: No PPS output
001: 1 PPS output
010: 2 PPS outputs
011: 3 PPS outputs
100: 4 PPS outputs
101-111: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:18 **TXCHCNT[3:0]**: Number of DMA Transmit Channels
This field indicates the number of DMA Transmit channels:
0000: 1 DMA Tx Channel
0001: 2 DMA Tx Channels
..
0111: 8 DMA Tx

Bits 17:16 Reserved, must be kept at reset value.

Bits 15:12 **RXCHCNT[3:0]**: Number of DMA Receive Channels
This field indicates the number of DMA Receive channels:
0000: 1 DMA Rx Channel
0001: 2 DMA Rx Channels
..
0111: 8 DMA Rx

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:6 **TXQCNT[3:0]**: Number of MTL Transmit Queues
This field indicates the number of MTL Transmit queues:
0000: 1 MTL Tx queue
0001: 2 MTL Tx queues
..
0111: 8 MTL Tx

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **RXQCNT[3:0]**: Number of MTL Receive Queues
This field indicates the number of MTL Receive queues:
0000: 1 MTL Rx queue
0001: 2 MTL Rx queues
..
0111: 8 MTL Rx

### MDIO address register (ETH_MACMDIOAR)

Address offset: 0x0200

Reset value: 0x0000 0000

The MDIO Address register controls the management cycles to external PHY through a management interface.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | NTC[2:0] | | | CR[3:0] | | | | Res. | Res. | Res. | SKAP | GOC[1:0] | | C45E | GB |
| | rw | rw | rw | rw | rw | rw | rw | | | | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **PSE**: Preamble Suppression Enable

When this bit is set, the SMA will suppress the 32-bit preamble and transmit MDIO frames with only 1 preamble bit.

When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications.

Bit 26 **BTB**: Back to Back transactions

When this bit is set and the NTC has value greater than 0, then the MAC will inform the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which will be executed immediately irrespective of the number trailing clocks generated for the previous frame.

When this bit is reset, then the read/write command completion (GMII busy is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame.

This bit must not be set when NTC=0.

Bits 25:21 **PA[4:0]**: Physical Layer Address

This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing.
This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.

Bits 20:16 **RDA[4:0]**: Register/Device Address

These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **NTC[2:0]**: Number of Training Clocks

This field controls the number of trailing clock cycles generated on ETH_MDC after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.

Bits 11:8 **CR[3:0]**: CSR Clock Range

The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design:
0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42
0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62
0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16
0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26
0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102
0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124
0110, 0111: Reserved
The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range.
When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks:
1000: CSR clock/4
1001: CSR clock/6
1010: CSR clock/8
1011: CSR clock/10
1100: CSR clock/12
1101: CSR clock/14
1110: CSR clock/16
1111: CSR clock/18

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SKAP**: Skip Address Packet

When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set.

Bits 3:2 **GOC[1:0]**: GMII Operation Command
This bit indicates the operation command to the PHY.
00: Reserved
01: Write
10: Post Read Increment Address for Clause 45 PHY
11: Read
When Clause 22 PHY is enabled, only Write and Read commands are valid.

Bit 1 **C45E**: Clause 45 PHY Enable
When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO.

Bit 0 **GB**: GMII Busy
The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIOS. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in ETH_MACMDIOAR and ETH_MACMDIODR registers as long as this bit is set.
For write transfers, the application must first write 16-bit data in the GD field (and also RA field when C45E is set) in ETH_MACMDIODR register before setting this bit. When C45E is set, it should also write into the RA field of ETH_MACMDIODR register before initiating a read transfer. When a read transfer is completed (GMII busy=0), the data read from the PHY register is valid in the GD field of the ETH_MACMDIODR register.
*Note: Even if the addressed PHY is not present, there is no change in the* functionality of this bit.

### MDIO data register (ETH_MACMDIODR)

Address offset: 0x0204

Reset value: 0x0000 0000

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in ETH_MACMDIOAR. This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RA[15:0] | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| GD[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **RA[15:0]**: Register Address
This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.

Bits 15:0 **GD[15:0]**: GMII Data
This field contains the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.

### ARP address register (ETH_MACARPAR)

Address offset: 0x0AE0

Reset value: 0x0000 0000

The ARP Address register contains the IPv4 Destination Address of the MAC.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ARPPA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ARPPA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ARPPA[31:0]**: ARP Protocol Address

This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet.
This field is available only when the Enable IPv4 ARP Offload option is selected.

### Address 0 high register (ETH_MACA0HR)

Address offset: 0x0300

Reset value: 0x8000 FFFF

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the GMII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the GMII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211.

If the MAC address registers are configured to be double-synchronized to the GMII clock domains, then the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 **AE**: Address Enable

This bit is always set to 1.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDRHI[15:0]**: MAC Address0[47:32]

This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

### Address x low register (ETH_MACAxLR)

Address offset: 0x0304 + 0x8 * x, (x = 0 to 3)

Reset value: 0xFFFF FFFF

The MAC Address x Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **ADDRLO[31:0]**: MAC Address x [31:0] (x = 0 to 3)

This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

### Address x high register (ETH_MACAxHR)

Address offset: 0x0308 + 0x8 * (x-1), (x = 1 to 3)

Reset value: 0x0000 FFFF

The MAC Address x High register holds the upper 16 bits of the second 6-byte MAC address of the station.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| AE | SA | MBC[5:0] | | | | | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw | rw | rw | rw | rw | rw | rw | rw | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ADDRHI[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **AE**: Address Enable

When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering.

Bit 30 **SA**: Source Address

When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address x[47:0] is used to compare with the DA fields of the received packet.

Bits 29:24 **MBC[5:0]**: Mask Byte Control

These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows:

Bit 29: Register 194[15:8]

Bit 28: Register 194[7:0]

Bit 27: Register 195[31:24]

..

Bit 24: Register 195[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDRHI[15:0]**: MAC Address1 [47:32]

This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

### MMC control register (ETH_MMC_CONTROL)

Address offset: 0x0700

Reset value: 0x0000 0000

This register configures the MMC operating mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | UCDBC | Res. | Res. | CNTPRSTLVL | CNTPRST | CNTFREEZ | RSTONRD | CNTSTOPRO | CNTRST |
| | | | | | | | rw | | | rw | rw | rw | rw | rw | rw |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **UCDBC**: Update MMC Counters for Dropped Broadcast Packets

The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set.

When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of ETH_MACPFR register.

When reset, the MMC Counters are not updated for dropped Broadcast packets.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **CNTPRSTLVL**: Full-Half Preset

When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2Kbytes) and all packet-counters get preset to 0x7FFF_FFF0 (Half 16).

When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2Kbytes) and all packet-counters get preset to 0xFFFF_FFF0 (Full 16).

For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0.

Bit 4 **CNTPRST**: Counters Preset

When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle.

This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full.

Bit 3 **CNTFREEZ**: MMC Counter Freeze

When this bit is set, it freezes all MMC counters to their current value.

Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode.

Bit 2 **RSTONRD**: Reset on Read

When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read.

Bit 1 **CNTSTOPRO**: Counter Stop Rollover

When this bit is set, the counter does not roll over to zero after reaching the maximum value.

Bit 0 **CNTRST**: Counters Reset

When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle.

### MMC Rx interrupt register (ETH_MMC_RX_INTERRUPT)

Address offset: 0x0704

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur:

- Receive statistic counters reach half of their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter).
- Receive statistic counters cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter).

When the Counter Stop Rollover is set, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | r | r | | | | | |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPITRCIS**: MMC Receive LPI transition counter interrupt status

This bit is set when the Rx_LPI_Tran_Cntr counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPIUSCIS**: MMC Receive LPI microsecond counter interrupt status

This bit is set when the Rx_LPI_USEC_Cntr counter reaches half of the maximum value or the maximum value.

Bits 25:18 Reserved, must be kept at reset value.

Bit 17 **RXUCGPIS**: MMC Receive Unicast Good Packet Counter Interrupt Status
This bit is set when the rxunicastpackets_g counter reaches half of the maximum value or the maximum value.

Bits 16:7 Reserved, must be kept at reset value.

Bit 6 **RXALGNERPIS**: MMC Receive Alignment Error Packet Counter Interrupt Status
This bit is set when the rxalignmenterror counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIS**: MMC Receive CRC Error Packet Counter Interrupt Status
This bit is set when the rxcrcerror counter reaches half of the maximum value or the maximum value.

Bits 4:0 Reserved, must be kept at reset value.

### MMC Tx interrupt register (ETH_MMC_TX_INTERRUPT)

Address offset: 0x0708

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones.

The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 27 **TXLPITRCIS**: MMC Transmit LPI transition counter interrupt status
This bit is set when the Tx_LPI_Tran_Cntr counter reaches half of the maximum value or the maximum value.

Bit 26 **TXLPIUSCIS**: MMC Transmit LPI microsecond counter interrupt status
This bit is set when the Tx_LPI_USEC_Cntr counter reaches half of the maximum value or the maximum value.

Bits 25:22 Reserved, must be kept at reset value.

Bit 21 **TXGPKTIS**: MMC Transmit Good Packet Counter Interrupt Status
This bit is set when the txpacketcount_g counter reaches half of the maximum value or the maximum value.

Bits 20:16 Reserved, must be kept at reset value.

Bit 15 **TXMCOLGPIS**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Status
This bit is set when the txmulticol_g counter reaches half of the maximum value or the maximum value.

Bit 14 **TXSCOLGPIS**: MMC Transmit Single Collision Good Packet Counter Interrupt Status
This bit is set when the txsinglecol_g counter reaches half of the maximum value or the maximum value.

Bits 13:0 Reserved, must be kept at reset value.

### MMC Rx interrupt mask register (ETH_MMC_RX_INTERRUPT_MASK)

Address offset: 0x070C

Reset value: 0x0000 0000

The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPITRCIM**: MMC Receive LPI transition counter interrupt Mask
Setting this bit masks the interrupt when the Rx_LPI_Tran_Cntr counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPIUSCIM**: MMC Receive LPI microsecond counter interrupt Mask
Setting this bit masks the interrupt when the Rx_LPI_USEC_Cntr counter reaches half of the maximum value or the maximum value.

Bits 25:18 Reserved, must be kept at reset value.

Bit 17 **RXUCGPIM**: MMC Receive Unicast Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the rxunicastpackets_g counter reaches half of the maximum value or the maximum value.

Bits 16:7 Reserved, must be kept at reset value.

Bit 6 **RXALGNERPIM**: MMC Receive Alignment Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the rxalignmenterror counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIM**: MMC Receive CRC Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the rxcrcerror counter reaches half of the maximum value or the maximum value.

Bits 4:0 Reserved, must be kept at reset value.

### MMC Tx interrupt mask register (ETH_MMC_TX_INTERRUPT_MASK)

Address offset: 0x0710

Reset value: 0x0000 0000

This register maintains the masks for interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt Mask register maintains the masks for the interrupts generated when the transmit statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide. This register is present only when any one of the MMC Transmit Counters is selected during core configuration.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TXLPITRCIM**: MMC Transmit LPI transition counter interrupt Mask
Setting this bit masks the interrupt when the Tx_LPI_Tran_Cntr counter reaches half of the maximum value or the maximum value.

Bit 26 **TXLPIUSCIM**: MMC Transmit LPI microsecond counter interrupt Mask
Setting this bit masks the interrupt when the Tx_LPI_USEC_Cntr counter reaches half of the maximum value or the maximum value.

Bits 25:21 Reserved, must be kept at reset value.

Bit 21 **TXGPKTIM**: MMC Transmit Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the txpacketcount_g counter reaches half of the maximum value or the maximum value.

Bits 20:16 Reserved, must be kept at reset value.

Bit 15 **TXMCOLGPIM**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the txmulticol_g counter reaches half of the maximum value or the maximum value.

Bit 14 **TXSCOLGPIM**: MMC Transmit Single Collision Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the txsinglecol_g counter reaches half of the maximum value or the maximum value.

Bits 13:0 Reserved, must be kept at reset value.

### Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)

Address offset: 0x074C

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after a single collision in the half-duplex mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **TXSNGLCOLG[31:0]**: Tx Single Collision Good Packets

This field indicates the number of successfully transmitted packets after a single collision in the half-duplex mode.

### Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)

Address offset: 0x0750

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after multiple collisions in the half-duplex mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXMULTCOLG[31:0]**: Tx Multiple Collision Good Packets

This field indicates the number of successfully transmitted packets after multiple collisions in the half-duplex mode.

### Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)

Address offset: 0x0768

Reset value: 0x0000 0000

This register provides the number of good packets transmitted by Ethernet peripheral.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXPKTG[31:0]**: Tx Packet Count Good

This field indicates the number of good packets transmitted.

### Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)

Address offset: 0x0794

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with CRC error.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RXCRCERR[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RXCRCERR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXCRCERR[31:0]**: Rx CRC Error Packets

This field indicates the number of packets received with CRC error.

### Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)

Address offset: 0x0798

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with alignment (dribble) error. It is valid only in 10/100 mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RXALGNERR[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RXALGNERR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXALGNERR[31:0]**: Rx Alignment Error Packets

This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

### Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)

Address offset: 0x07C4

Reset value: 0x0000 0000

This register provides the number of good unicast packets received by Ethernet peripheral.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RXUCASTG[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RXUCASTG[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXUCASTG[31:0]**: Rx Unicast Packets Good

This field indicates the number of good unicast packets received.

### Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)

Address offset: 0x07EC

Reset value: 0x0000 0000

This register provides the number of microseconds Tx LPI is asserted by Ethernet peripheral.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TXLPIUSC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TXLPIUSC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXLPIUSC[31:0]**: Tx LPI Microseconds Counter

This field indicates the number of microseconds Tx LPI is asserted. For every Tx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

### Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)

Address offset: 0x07F0

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Tx LPI.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TXLPITRC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TXLPITRC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXLPITRC[31:0]**: Tx LPI Transition counter

This field indicates the number of times Tx LPI Entry has occurred. Even if Tx LPI Entry occurs in Automate Mode (because of LPITXA bit set in the LPI Control and Status register), the counter will increment.

### Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)

Address offset: 0x07F4

Reset value: 0x0000 0000

This register provides the number of microseconds Rx LPI is sampled by Ethernet peripheral.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RXLPIUSC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RXLPIUSC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXLPIUSC[31:0]**: Rx LPI Microseconds Counter

This field indicates the number of microseconds Rx LPI is asserted. For every Rx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

### Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)

Address offset: 0x07F8

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Rx LPI.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RXLPITRC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RXLPITRC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXLPITRC[31:0]**: Rx LPI Transition counter

This field indicates the number of times Rx LPI Entry has occurred.

### L3 and L4 control 0 register (ETH_MACL3L4C0R)

Address offset: 0x0900

Reset value: 0x0000 0000

The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4. This register is reserved if the Layer 3 and Layer 4 Filtering feature is not selected during core configuration.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | L4DPIM0 | L4DPM0 | L4SPIM0 | L4SPM0 | Res. | L4PEN0 |
| | | | | | | | | | | rw | rw | rw | rw | | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| L3HDBM0[4:0] | | | | | L3HSBM0[4:0] | | | | | L3DAIM0 | L3DAM0 | L3SAIM0 | L3SAM0 | Res. | L3PEN0 |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM0**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM0 bit is set high.

Bit 20 **L4DPM0**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM0**: Layer 4 Source Port Inverse Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4SPM0 bit is set high.

Bit 18 **L4SPM0**: Layer 4 Source Port Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **L4PEN0**: Layer 4 Protocol Enable

When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set.

Bits 15:11 **L3HDBM0[4:0]**: Layer 3 IP DA Higher Bits Match

IPv4 Packets:

This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

IPv6 Packets:

Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits:

0: No bits are masked.

1: LSb[0] is masked.

2: Two LSbs [1:0] are masked

..

127: All bits except MSb are masked.

This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.

Bits 10:6 **L3HSBM0[4:0]**: Layer 3 IP SA Higher Bits Match

IPv4 Packets:

This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

IPv6 Packets:

This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.

Bit 5 **L3DAIM0**: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM0 bit is set high.

Bit 4 **L3DAM0**: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

*Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering.*

Bit 3 **L3SAIM0**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3SAM0 bit is set.

Bit 2 **L3SAM0**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

*Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering.*

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN0**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set.

### Layer4 address filter 0 register (ETH_MACL4A0R)

Address offset: 0x0904

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| L4DP0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| L4SP0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **L4DP0[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in ETH_MACL3L4C0R register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP0[15:0]**: Layer 4 Source Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in ETH_MACL3L4C0R register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

### Layer 3 Address 0 filter 0 register (ETH_MACL3A00R)

Address offset: 0x0910

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 Register 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| L3A00[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| L3A00[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A00[31:0]**: Layer 3 Address 0 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

### Layer3 address 1 filter 0 register (ETH_MACL3A10R)

Address offset: 0x0914

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 Register 0 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| L3A10[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| L3A10[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A10[31:0]**: Layer 3 Address 1 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

### Layer3 Address 2 filter 0 register (ETH_MACL3A20)

Address offset: 0x0918

Reset value: 0x0000 0000

The Layer 3 Address 2 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| L3A20[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| L3A20[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A20[31:0]**: Layer 3 Address 2 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the ETH_MACL3L4C0R register, this field is not used.

### Layer3 Address 3 filter 0 register (ETH_MACL3A30)

Address offset: 0x091C

Reset value: 0x0000 0000

The Layer 3 Address 3 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| L3A30[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| L3A30[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A30[31:0]**: Layer 3 Address 3 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the ETH_MACL3L4C0R register, this field is not used.

### L3 and L4 control 1 register (ETH_MACL3L4C1R)

Address offset: 0x0930

Reset value: 0x0000 0000

The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | L4DPIM1 | L4DPM1 | L4SPIM1 | L4SPM1 | Res. | L4PEN1 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM1**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM0 bit is set high.

Bit 20 **L4DPM1**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM1**: Layer 4 Source Port Inverse Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4SPM0 bit is set high.

Bit 18 **L4SPM1**: Layer 4 Source Port Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **L4PEN1**: Layer 4 Protocol Enable

When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set.

Bits 15:11 **L3HDBM1[4:0]**: Layer 3 IP DA Higher Bits Match

IPv4 Packets:

This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

IPv6 Packets:

Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits:

0: No bits are masked.

1: LSb[0] is masked.

2: Two LSbs [1:0] are masked

..

127: All bits except MSb are masked.

This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.

Bits 10:6 **L3HSBM1[4:0]**: Layer 3 IP SA Higher Bits Match

IPv4 Packets:

This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

IPv6 Packets:

This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.

Bit 5 **L3DAIM1**: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM0 bit is set high.

Bit 4 **L3DAM1**: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

*Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering.*

Bit 3 **L3SAIM1**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3SAM0 bit is set.

Bit 2 **L3SAM1**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

*Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering.*

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN1**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set.

### Layer 4 address filter 1 register (ETH_MACL4A1R)

Address offset: 0x0934

Reset value: 0x0000 0000

The Layer 4 Address 0 register and registers 580 through 667 are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core.

You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **L4DP1[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in ETH_MACL3L4C0R register, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP1[15:0]**: Layer 4 Source Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in ETH_MACL3L4C0R register, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

### Layer3 address 0 filter 1 Register (ETH_MACL3A01R)

Address offset: 0x0940

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 Register 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **L3A01[31:0]**: Layer 3 Address 0 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

### Layer3 address 1 filter 1 register (ETH_MACL3A11R)

Address offset: 0x0944

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 Register 0 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A11[31:0]**: Layer 3 Address 1 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the ETH_MACL3L4C0R register, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

### Layer3 address 2 filter 1 Register (ETH_MACL3A21R)

Address offset: 0x0948

Reset value: 0x0000 0000

The Layer 3 Address 2 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A21[31:0]**: Layer 3 Address 2 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the ETH_MACL3L4C0R register, this field is not used.

### Layer3 address 3 filter 1 register (ETH_MACL3A31R)

Address offset: 0x94C

Reset value: 0x0000 0000

The Layer 3 Address 3 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| L3A31[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A31[31:0]**: Layer 3 Address 3 Field

When the L3PEN0 and L3SAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the ETH_MACL3L4C0R register, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the ETH_MACL3L4C0R register, this field is not used.

### Timestamp control Register (ETH_MACTSCR)

Address offset: 0x0B00

Reset value: 0x0000 2000

This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the Receiver.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | AV8021ASMEN | Res. | Res. | Res. | TXTSSTSM | Res. | Res. | Res. | Res. | CSC | TSENMACADDR | SNAPTYPSEL[1:0] | |
| | | | rw | | | | rw | | | | | r | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TSMSTRENA | TSEVNTENA | TSIPV4ENA | TSIPV6ENA | TSIPENA | TSVER2ENA | TSCTRLSSR | TSENALL | Res. | Res. | TSADDREG | Res. | TSUPDT | TSINIT | TSCFUPDT | TSENA |
| rw | rw | rw | rw | rw | rw | rw | rw | | | rw | | rw | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **AV8021ASMEN**: AV 802.1AS Mode Enable

When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS operating mode.

When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **TXTSSTSM**: Transmit Timestamp Status Mode

When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSTSMIS bit of the ETH_MACTXTSSNR register.

When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSTSHI bit of the ETH_MACTXTSSSR register.

Bits 23:20 Reserved, must be kept at reset value.

Bit 19 **CSC**: Enable checksum correction during OST for PTP over UDP/IPv4 packets

When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. The application shall form the packet with these two dummy bytes.

When reset, no updates are done to keep the UDP checksum correct. The application shall form the packet with UDP checksum set to 0.

Bit 18 **TSENMACADDR**: Enable MAC Address for PTP Packet Filtering

When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet.

When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet.

For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching.

For PTP offload, only MAC address register 0 is considered for unicast destination address matching.

Bits 17:16 **SNAPTYPSEL[1:0]**: Select PTP packets for Taking Snapshots

These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.

Bit 15 **TSMSTRENA**: Enable Snapshot for Messages Relevant to Master

When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.

Bit 14 **TSEVNTENA**: Enable Timestamp Snapshot for Event Messages

When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table.

Bit 13 **TSIPV4ENA**: Enable Processing of PTP Packets Sent over IPv4-UDP

When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default.

Bit 12 **TSIPV6ENA**: Enable Processing of PTP Packets Sent over IPv6-UDP
When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets.

Bit 11 **TSIPENA**: Enable Processing of PTP over Ethernet Packets
When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets.

Bit 10 **TSVER2ENA**: Enable PTP Packet Processing for Version 2 Format
When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'.

Bit 9 **TSCTRLSSR**: Timestamp Digital or Binary Rollover Control
When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit.

Bit 8 **TSENALL**: Enable Timestamp for All Packets
When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **TSADDREG**: Update Addend Register
When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **TSUPDT**: Update Timestamp
When this bit is set, the system time is updated (added or subtracted) with the value specified in ETH_MACSTSUR and ETH_MACSTNUR.
This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated.

Bit 2 **TSINIT**: Initialize Timestamp
When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC Register 80 (System Time Seconds Update Register) and MAC Register 81 (System Time Nanoseconds Update Register).
This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized.

Bit 1 **TSCFUPDT**: Fine or Coarse Timestamp Update
When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp.

Bit 0 **TSENA**: Enable Timestamp
When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode.
On the Receive side, the MAC processes the 1588 packets only if this bit is set.

*Table 534* indicates the PTP messages for which a snapshot is taken depending on the SNAPTYPSEL field in ETH_MACTSCR register.

**Table 534. Timestamp Snapshot Dependency on Register Bits**

| SNAPTYPSEL | TSMSTRENA | TSEVNTENA | PTP Messages |
|---|---|---|---|
| 00 | X | 0 | SYNC, Follow_Up, Delay_Req, Delay_Resp |
| 00 | 0 | 1 | SYNC |
| 00 | 1 | 1 | Delay_Req |
| 01 | X | 0 | SYNC, Follow_Up, Delay_Req, Delay_Resp, Pdelay_Req, Pdelay_Resp, Pdelay_Resp_Follow_Up |
| 01 | 0 | 1 | SYNC, Pdelay_Req, Pdelay_Resp |
| 01 | 1 | 1 | Delay_Req, Pdelay_Req, Pdelay_Resp |
| 10 | X | X | SYNC, Delay_Req |
| 11 | X | X | Pdelay_Req, Pdelay_Resp |

### Sub-second increment register (ETH_MACSSIR)

Address offset: 0x0B04

Reset value: 0x0000 0000

The Sub-second Increment register is present only when the IEEE 1588 timestamp feature is selected without an external timestamp input. In Coarse Update mode [Bit 1 in ETH_MACTSCR register, the value in this register is added to the system time every clock cycle of HCLK. In Fine Update mode, the value in this register is added to the system time whenever the Accumulator gets an overflow.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SSINC[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SNSINC[7:0] | | | | | | | | Res | Res | Res | Res | Res | Res | Res | Res |
| rw | rw | rw | rw | rw | rw | rw | rw | | | | | | | | |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SSINC[7:0]**: Sub-second Increment Value

The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in ETH_MACTSCR]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.

Bits 15:8 **SNSINC[7:0]**:Sub-nanosecond Increment Value

This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8.

This value is accumulated with the sub-nanoseconds field of the sub-second register.

For example, when TSCTRLSSR field in the ETH_MACTSCR register is set. and if the required increment is 5.3ns, then SSINC should be 0x05 and SNSINC should be 0x4C.

Bits 7:0 Reserved, must be kept at reset value.

### System time seconds register (ETH_MACSTSR)

Address offset: 0x0B08

Reset value: 0x0000 0000

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from HCLK to CSR clock).

This register is present only when the IEEE 1588 Timestamp feature is selected without external timestamp input.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| TSS[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TSS[31:0]**: Timestamp Second

The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

### System time nanoseconds register (ETH_MACSTNR)

Address offset: 0x0B0C

Reset value: 0x0000 0000

The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC.

This register is present only when the IEEE 1588 Timestamp feature is selected without external timestamp input.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | TSSS[30:16] | | | | | | | | | | | | | | |
| | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TSSS[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **TSSS[30:0]**: Timestamp Sub-seconds

The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When Bit 9 is set in ETH_MACTSCR, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

### System time seconds update register (ETH_MACSTSUR)

Address offset: 0x0B10

Reset value: 0x0000 0000

The System Time Seconds Update register, along with the System Time Nanoseconds Update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in ETH_MACTSCR register.

This register is present only when the IEEE 1588 Timestamp feature is selected without external timestamp input.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TSS[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **TSS[31:0]**: Timestamp Seconds

The value in this field is the sub-second part of the update. When ADDSUB is reset, this field must be programmed with the sub-second part of the update value, with an accuracy based on the TSCTRLSSR bit of the ETH_MACTSCR register. When ADDSUB is set, then this field must be programmed with the complement of the sub-second part of the update value as described below.

When TSCTRLSSR is set, then the programmed value must be 10^9 - <sub-second value>. When TSCTRLSSR is reset, then the programmed value must be 2^31 - <sub-second_value>

For example, when TSCTRLSSR bit is set and if 2.000000001 seconds need to be subtracted from the system time, then the TSS field in the MAC_Timestamp Seconds update register must be 0xFFFF_FFFE (that is, 2^32 - 2), ADDSUB bit in this register should be set, and the TSSS field must be 0x3B9A_C9FF (that is, 10^9 - 1).

### System time nanoseconds update register (ETH_MACSTNUR)

Address offset: 0x0B14

Reset value: 0x0000 0000

This register is present only when the IEEE 1588 timestamp feature is selected without external timestamp input.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| TSSS[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **ADDSUB**: Add or Subtract Time

When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register.

Bits 30:0 **TSSS[30:0]**: Timestamp Sub-seconds

The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the ETH_MACTSCR register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF.

### Timestamp addend register (ETH_MACTSAR)

Address offset: 0x0B18

Reset value: 0x0000 0000

The Timestamp Addend register is present only when the IEEE 1588 Timestamp feature is selected without external timestamp input. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the ETH_MACTSCR register). The content of this register is added to a 32-bit accumulator in every clock cycle (of HCLK) and the system time is updated whenever the accumulator overflows.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **TSAR[31:0]**: Timestamp Addend Register

This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

### Timestamp status register (ETH_MACTSSR)

Address offset: 0x0B20

Reset value: 0x0000 0000

The Timestamp Status register is present only when the IEEE 1588 Timestamp feature is selected. All bits except Bits[27:25] gets cleared when the application reads this register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | | | | | | | | | | | | r | r | r | r |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **ATSNS[4:0]**: Number of Auxiliary Timestamp Snapshots

This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.

Bit 24 **ATSSTM**: Auxiliary Timestamp Snapshot Trigger Missed

This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ATSSTN[3:0]**: Auxiliary Timestamp Snapshot Trigger Identifier

These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list:

Bit 16: Auxiliary trigger 0

Bit 17: Auxiliary trigger 1

Bit 18: Auxiliary trigger 2

Bit 19: Auxiliary trigger 3

The software can read this register to find the triggers that are set when the timestamp is taken.

Bit 15 **TXTSSIS**: Tx Timestamp Status Interrupt Status

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the ETH_MACTXTSSNR and ETH_MACTXTSSSR registers.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the ETH_MACTXTSSNR and ETH_MACTXTSSSR registers, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the ETH_MACTXTSSSR register is read.

This bit is reserved in all other configurations.

Bits 14:4 Reserved, must be kept at reset value.

Bit 3 **TSTRGTERR0**: Timestamp Target Time Error

This bit is set when the latest target time programmed in the ETH_MACPPS_Target_Time_seconds and ETH_MACPPS_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit.

Bit 2 **AUXTSTRIG**: Auxiliary Timestamp Trigger Snapshot

This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.

Bit 1 **TSTARGT0**: Timestamp Target Time Reached

When set, this bit indicates that the value of system time is greater than or equal to the value specified in the ETH_MACPPS_Target_Time_seconds and ETH_MACPPS_Target_Time_Nanoseconds registers.

Bit 0 **TSSOVF**: Timestamp Seconds Overflow

When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF.

### Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)

Address offset: 0x0B30

Reset value: 0x0000 0000

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| TXTSSLO[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 **TXTSSMIS**: Transmit Timestamp Status Missed

When this bit is set, it indicates one of the following:

– The timestamp of the current packet is ignored if TXTSSTSM bit of the ETH_MACTSCR register is reset

– The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the ETH_MACTSCR register is set.

Bits 30:0 **TXTSSLO[30:0]**: Transmit Timestamp Status Low

This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

### Tx timestamp status seconds register (ETH_MACTXTSSSR)

Address offset: 0x0B34

Reset value: 0x0000 0000

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| TXTSSHI[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXTSSHI[31:0]**: Transmit Timestamp Status High

This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

### Auxiliary control register (ETH_MACACR)

Address offset: 0x0B40

Reset value: 0x0000 0000

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | rw | rw | rw | rw | | | | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ATSEN3**: Auxiliary Snapshot 3 Enable

This bit controls the capturing of Auxiliary Snapshot Trigger 3. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[3] input is enabled. When this bit is reset, the events on this input are ignored.

This bit is reserved when one of the following is true:

– The Add IEEE 1588 Auxiliary Snapshot option is not selected while configuring the core.

– The selected number in the Number of IEEE 1588 Auxiliary Snapshot Inputs option is less than four.

Bit 6 **ATSEN2**: Auxiliary Snapshot 2 Enable

This bit controls the capturing of Auxiliary Snapshot Trigger 2. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[2] input is enabled. When this bit is reset, the events on this input are ignored.

This bit is reserved when one of the following is true:

– The Add IEEE 1588 Auxiliary Snapshot option is not selected while configuring the core.

– The selected number in the Number of IEEE 1588 Auxiliary Snapshot Inputs option is less than 3.

Bit 5 **ATSEN1**: Auxiliary Snapshot 1 Enable

This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[1] input is enabled. When this bit is reset, the events on this input are ignored.

This bit is reserved when one of the following is true:

– The Add IEEE 1588 Auxiliary Snapshot option is not selected while configuring the core.

– The selected number in the Number of IEEE 1588 Auxiliary Snapshot Inputs option is less than 2.

Bit 4 **ATSEN0**: Auxiliary Snapshot 0 Enable

This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[0] input is enabled. When this bit is reset, the events on this input are ignored.

This bit is reserved when the Add IEEE 1588 Auxiliary Snapshot option is not selected while configuring the core.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ATSFC**: Auxiliary Snapshot FIFO Clear

When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO.

This bit is reserved when the Add IEEE 1588 Auxiliary Snapshot option is not selected while configuring the core.

### Auxiliary timestamp nanoseconds register (ETH_MACATSNR)

Address offset: 0x0B48

Reset value: 0x0000 0000

The Auxiliary Timestamp Nanoseconds register, along with ETH_MACATSSR, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4 words.

You can store multiple snapshots in this FIFO. Bits[29:25] in ETH_MACTSSR indicate the fill-level of the FIFO. The top of the FIFO is removed only when the last byte of MAC Register 91 (Auxiliary Timestamp - Seconds Register) is read. In the little-endian mode, this means when Bits[31:24] are read and in big-endian mode, Bits[7:0] are read.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **AUXTSLO[30:0]**: Auxiliary Timestamp

Contains the lower 31 bits (nanoseconds field) of the auxiliary timestamp.

### Auxiliary timestamp seconds register (ETH_MACATSSR)

Address offset: 0x0B4C

Reset value: 0x0000 0000

The Auxiliary Timestamp - Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **AUXTSHI[31:0]**: Auxiliary Timestamp

Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

### Timestamp Ingress asymmetric correction register (ETH_MACTSIACR)

Address offset: 0x0B50

Reset value: 0x0000 0000

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay_Resp PTP messages.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| OSTIAC[31:16] | | | | | | | | | | | | | | | |

| OSTIAC[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **OSTIAC[31:0]**: One-Step Timestamp Ingress Asymmetry Correction

This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2^16. For example, 2.5 ns is represented as 0x00028000.

The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

### Timestamp Egress asymmetric correction register (ETH_MACTSEACR)

Address offset: 0x0B54

Reset value: 0x0000 0000

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| OSTEAC[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **OSTEAC[31:0]**: One-Step Timestamp Egress Asymmetry Correction

This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^16.

For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 216). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 216).

### Timestamp Ingress correction nanosecond register (ETH_MACTSICNR)

Address offset: 0x0B58

Reset value: 0x0000 0000

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| TSIC[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **TSIC[31:0]**: Timestamp Ingress Correction

This field contains the ingress path correction value as defined by the Ingress Correction expression.

### Timestamp Egress correction nanosecond register (ETH_MACTSECNR)

Address offset: 0x0B5C

Reset value: 0x0000 0000

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **TSEC[31:0]**: Timestamp Egress Correction

This field contains the nanoseconds part of the egress path correction value as defined by the Egress Correction expression.

### PPS control register [alternate] (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

The PPS Control register is present only when the Timestamp feature is selected and External Timestamp is not enabled.

Bits[30:24] of this register are valid only when four Flexible PPS outputs are selected. Bits[22:16] are valid only when three or more Flexible PPS outputs are selected. Bits[14:8] are valid only when two or more Flexible PPS outputs are selected. Bits[6:4] are valid only when Flexible PPS feature is selected.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRGTMODSEL0[1:0] | | PPSEN0 | PPSCTRL[3:0] | | | |
| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output

This field indicates the Target Time registers (MAC registers 96 and 97) mode for PPS output signal:

00: Target Time registers are programmed only for generating the interrupt event.

01: Reserved

10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.

11: Target Time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.

Bit 4 **PPSEN0**: Flexible PPS Output Mode Enable

When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode).

Bits 3:0 **PPSCTRL[3:0]**: PPS Output Frequency Control

This field controls the frequency of the PPS output (ptp_pps_o) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies:

0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz.

0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz.

0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz.

0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz.

..

1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz.

*Note: In the binary rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example:*

- *When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms*
- *When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of*
  *One clock of 50 percent duty cycle and 537 ms period*
  *Second clock of 463 ms period (268 ms low and 195 ms high)*
- *When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of*
  *Three clocks of 50 percent duty cycle and 268 ms period*
  *Fourth clock of 195 ms period (134 ms low and 61 ms high)*

This behavior is because of the non-linear toggling of bits in the digital rollover mode in the ETH_MACSTNR register.

### PPS control register [alternate] (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

The PPS Control register is present only when the Timestamp feature is selected and External Timestamp is not enabled.

Bits[30:24] of this register are valid only when four Flexible PPS outputs are selected. Bits[22:16] are valid only when three or more Flexible PPS outputs are selected. Bits[14:8] are valid only when two or more Flexible PPS outputs are selected. Bits[6:4] are valid only when Flexible PPS feature is selected.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRGTMODSEL0[1:0] | | PPSEN0 | PPSCMD[3:0] | | | |
| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output

This field indicates the Target Time registers (MAC registers 96 and 97) mode for PPS output signal:

00: Target Time registers are programmed only for generating the interrupt event.

01: Reserved

10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.

11: Target Time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.

Bit 4 **PPSEN0**: Flexible PPS Output Mode Enable

When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode).

Bits 3:0 **PPSCMD[3:0]:** Flexible PPS Output (ptp_pps_o[0]) Control

Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0:

0000: No Command

0001: START Single Pulse

This command generates single pulse rising at the start point defined in Target Time Registers (register 455 and 456) and of a duration defined in the PPS Width Register.

0010: START Pulse Train

This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands.

0011: Cancel START

This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time.

0100: STOP Pulse train at time

This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses.

0101: STOP Pulse Train immediately

This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010).

0110: Cancel STOP Pulse train

This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command.

0111-1111: Reserved

### PPS target time seconds register (ETH_MACPPSTTSR)

Address offset: 0x0B80

Reset value: 0x0000 0000

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of ETH_MACTSSR] when the system time exceeds the value programmed in these registers.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TSTRH0[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TSTRH0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **TSTRH0[31:0]**: PPS Target Time Seconds Register

This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the ETH_MACPPSCR register.

### PPS target time nanoseconds register (ETH_MACPPSTTNR)

Address offset: 0x0B84

Reset value: 0x0000 0000

The PPS Target Time Nanoseconds register is present only when more than one Flexible PPS output is selected.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TRGTBUSY0 | TTSL0[30:16] | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TTSL0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **TRGTBUSY0**: PPS Target Time Register Busy

The MAC sets this bit when the PPSCMD0 field in the ETH_MACPPSCR register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain.

The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted.

Bits 30:0 **TTSL0[30:0]**: Target Time Low for PPS Register

This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in ETH_MACPPSCR.

When the TSCTRLSSR bit is set in the ETH_MACTSCR register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value.

### PPS interval register (ETH_MACPPSIR)

Address offset: 0x0B88

Reset value: 0x0000 0000

The PPS Interval register contains the number of units of sub-second increment value between the rising edges of PPS signal output (ptp_pps_o[0]).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PPSINT0[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PPSINT0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **PPSINT0[31:0]**: PPS Output Signal Interval

These bits store the interval between the rising edges of PPS signal output. The interval is stored in terms of number of units of sub-second increment value.

You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

### PPS width register (ETH_MACPPSWR)

Address offset: 0x0B8C

Reset value: 0x0000 0000

The PPS Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS signal output (ptp_pps_o).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PPSWIDTH0[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PPSWIDTH0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **PPSWIDTH0[31:0]**: PPS Output Signal Width

These bits store the width between the rising edge and corresponding falling edge of PPS signal output. The width is stored in terms of number of units of sub-second increment value.

You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register.

*Note: The value programmed in this register must be lesser than the value programmed in ETH_MACPP0IR register.*

### PTP Offload control register (ETH_MACPOCR)

Address offset: 0x0BC0

Reset value: 0x0000 0000

This register controls the PTP Offload Engine operation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DN[7:0] | | | | | | | | Res. | DRRDIS | APDREQTRIG | ASYNCTRIG | Res. | APDREQEN | ASYNCEN | PTOEN |
| rw | rw | rw | rw | rw | rw | rw | rw | | rw | rw | rw | | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **DN[7:0]**: Domain Number
This field indicates the domain Number in which the PTP node is operating.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **DRRDIS**: Disable PTO Delay Request/Response response generation
When this bit is set, the Delay Request and Delay response will not be generated for received SYNC and Delay request packet respectively, as required by the programmed mode.

Bit 5 **APDREQTRIG**: Automatic PTP Pdelay_Req message Trigger
When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation.

Bit 4 **ASYNCTRIG**: Automatic PTP SYNC message Trigger
When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **APDREQEN**: Automatic PTP Pdelay_Req message Enable
When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode.

Bit 1 **ASYNCEN**: Automatic PTP SYNC message Enable
When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode.

Bit 0 **PTOEN**: PTP Offload Enable
When this bit is set, the PTP Offload feature is enabled.

### PTP Source Port Identity 0 Register (ETH_MACSPI0R)

Address offset: 0x0BC4

Reset value: 0x0000 0000

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| SPI0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **SPI0[31:0]**: Source Port Identity 0
This field indicates bits [31:0] of sourcePortIdentity of PTP node.

### PTP Source port identity 1 register (ETH_MACSPI1R)

Address offset: 0x0BC8

Reset value: 0x0000 0000

This register contains Bits[63:32] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| SPI1[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **SPI1[31:0]**: Source Port Identity 1
This field indicates bits [63:32] of sourcePortIdentity of PTP node.

### PTP Source port identity 2 register (ETH_MACSPI2R)

Address offset: 0x0BCC

Reset value: 0x0000 0000

This register contains Bits[79:64] of the 80-bit Source Port Identity of the PTP node.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| SPI2[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SPI2[15:0]**: Source Port Identity 2
This field indicates bits [79:64] of sourcePortIdentity of PTP node.

### Log message interval register (ETH_MACLMIR)

Address offset: 0x0BD0

Reset value: 0x0000 0000

This register contains the periodic intervals for automatic PTP packet generation.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| LMPDRI[7:0] | | | | | | | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw | rw | rw | rw | rw | rw | rw | rw | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | DRSYNCR[2:0] | | | LSI[7:0] | | | | | | | |
| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **LMPDRI[7:0]**: Log Min Pdelay_Req Interval

This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15.Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

Bits 23:11 Reserved, must be kept at reset value.

Bits 10:8 **DRSYNCR[2:0]**:

Delay_Req to SYNC Ratio

In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted.

0: DelayReq generated for every received SYNC

1: DelayReq generated every alternate reception of SYNC

2: for every 4 SYNC messages

3: for every 8 SYNC messages

4: for every 16 SYNC messages

5: for every 32 SYNC messages

6-7: Reserved

The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The reception processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message.

Bits 7:0 **LSI[7:0]**:

Log Sync Interval

This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

## Ethernet MAC register map and reset values

Refer to *Section 2.5 on page 156* for the register boundary addresses.

# 65 Hardware debug port (HDP)

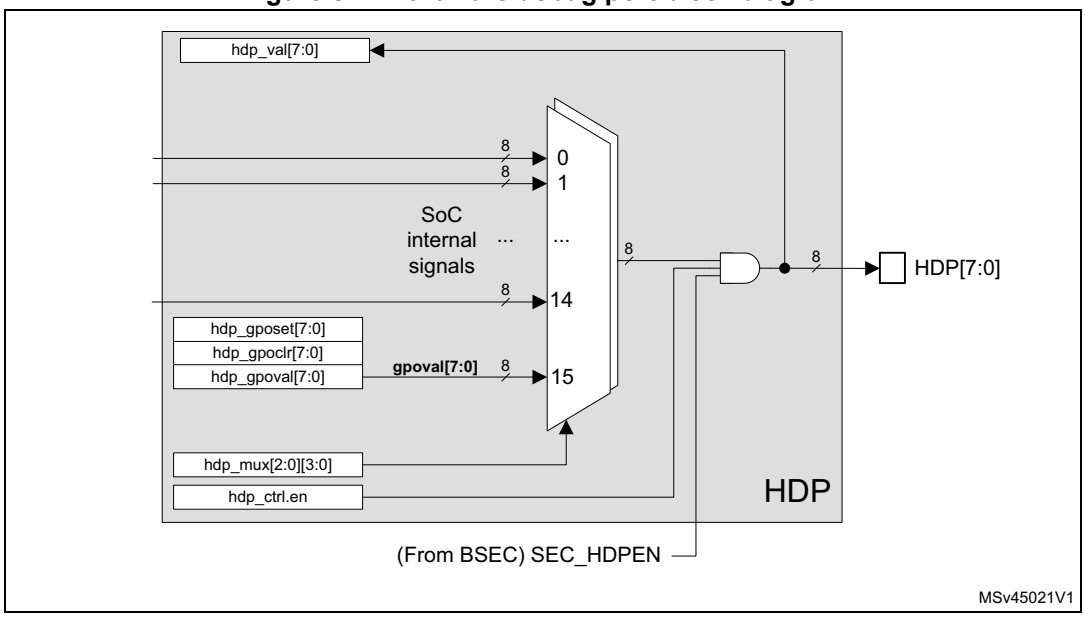
The Hardware Debug Port allows the observation of internal signals. By using multiplexers, up to 16 signals for each of 8-bit output can be observed.

## 65.1 Features

- 8 output signals
- One of 15 internal signals with individual control
- 8 Software programmable signals for pinout agnostic code debugging
- Output disabling by security signal

## 65.2 Block diagram

**Figure 811. Hardware debug port block diagram**



## 65.3 Functional description

The main multiplexer, allowing the selection of the 8-signal debug set to be output, is controlled through the HDP_CTRL register.

The HDP value at the output of the main multiplexer can be read by software through the HDP_VAL register.

During debug it is often useful to output some signals that are controlled by software; these can be used to observe a precise code sequence or to indicate the current executed task. Debug set #15 is reserved for this purpose; it provides on HDP outputs the value of the HDP_GPOVAL register. This register is associated with set and clear registers (HDP_GPOSET and HDP_GPOCLR) allowing the signals to be toggled without a read-modify-write sequence.

Some debug sets expose internal data that require protection; the SEC_HDPEN signal, when low, forces all the HDP block outputs low.

*Note: The internal signals may toggle at a higher rate than the pads can support, in which case their observability may be compromised. The user should be aware of this limitation when using the HDP port.*

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EN |
| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **EN**: Enable HDP
Valid if enabled in BSEC.

### 65.4.2 HDP multiplexers control register (HDP_MUX)

Address offset: 0x004

Reset value: 0x0000 0000

HDP multiplexing

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 **MUX7[3:0]**: Select the HDP7 output among the 16 available signals

Bits 27:24 **MUX6[3:0]**: Select the HDP6 output among the 16 available signals

Bits 23:20 **MUX5[3:0]**: Select the HDP5 output among the 16 available signals

Bits 19:16 **MUX4[3:0]**: Select the HDP4 output among the 16 available signals

Bits 15:12 **MUX3[3:0]**: Select the HDP3 output among the 16 available signals

Bits 11:8 **MUX2[3:0]**: Select the HDP2 output among the 16 available signals

Bits 7:4 **MUX1[3:0]**: Select the HDP1 output among the 16 available signals

Bits 3:0 **MUX0[3:0]**: Select the HDP0 output among the 16 available signals

### 65.4.3 HDP read back value register (HDP_VAL)

Address offset: 0x010

Reset value: 0x0000 0000

HDP value

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HDPVAL[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPVAL[7:0]**: HDP read back value

Provides the value of the HDP signals.

### 65.4.4 HDP general purpose output set register (HDP_GPOSET)

Address offset: 0x014

Reset value: 0xXXXX XXXX

HDP GPO set

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HDPGPOSET[7:0] | | | | | | | |
| | | | | | | | | w | w | w | w | w | w | w | w |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPGPOSET[7:0]**: HDP general purpose output set

When a bit is written to 1, the corresponding HDP GPO is set. Writing a bit to 0 has no effect.

### 65.4.5 HDP general purpose output clear register (HDP_GPOCLR)

Address offset: 0x018

Reset value: 0xXXXX XXXX

HDP GPO clear

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HDPGPOCLR[7:0] | | | | | | | |
| | | | | | | | | w | w | w | w | w | w | w | w |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPGPOCLR[7:0]**: HDP general purpose output clear

When a bit is written to 1, the corresponding HDP GPO is cleared. Writing a bit to 0 has no effect.

### 65.4.6 HDP general purpose output value register (HDP_GPOVAL)

Address offset: 0x01C

Reset value: 0x0000 0000

HDP GPO value

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HDPGPOVAL[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPGPOVAL[7:0]**: HDP general purpose output value

When written, defines the value of the HDP GPO. When read, provides the current GPO value.

### 65.4.7 HDP version register (HDP_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0010

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

# 66 Debug support (DBG)

## 66.1 Introduction

A comprehensive set of debug features is provided to support software development and system integration:

- Independent breakpoint debugging of each CPU core in the system
- Code execution tracing
- Software instrumentation
- Cross-triggering
- The debug features can be controlled via a JTAG/Serial-wire debug access port, using industry standard debugging tools. A trace port allows data to be captured for logging and analysis.

The debug features are based on Arm® CoreSight™ components:

- SWJ-DP: JTAG/Serial-wire debug port
- AXI-AP: AXI access port
- AHB-AP: AHB access port
- APB-AP: APB access port
- ITM: Instrumentation Trace Macrocell
- DWT: Data Watchpoint and Trace
- ETM: Embedded Trace Macrocell
- ETF: Embedded Trace FIFO
- TPIU: Trace Port Interface Unit
- SWO: Serial Wire Output
- CTI: Cross Trigger Interface
- CTM: Cross Trigger Matrix
- Timestamp Generator
- STM: System Trace Macrocell

These components are described in *Section 66.10* to *Section 66.12*. More information can be found in the Arm® documents referenced in *Section 66.13*.

## 66.2 Debug use cases

The trace and debug system has been designed to support a variety of typical use cases:

- Low cost software trace (Cortex®-M4 only)

  Limited trace capability is available over the single-wire debug output. This supports code instrumentation using “printf”, tracing of data and address watchpoints, interrupt detection and program counter sampling.
- External debugging of each core independently

  All processor cores can be simultaneously and independently debugged using equipment connected to the JTAG/SWD debug port. This allows breakpoint and watchpoint setting, code stepping, memory access etc.
- Self-hosted debugging of each core independently

  All processor cores can be simultaneously and independently debugged by software running on one of the cores. This allows breakpoint and watchpoint setting, code stepping, memory access etc.
- Synchronous debugging of both cores

  When one core stops due to a breakpoint or a debugger stop command, the other core can be stopped as well. Similarly, the cores can be restarted at the same time. This allows debugging of loosely coupled applications which require the processors to remain synchronized.
- Tracing code execution from one or more cores via the trace port

  Trace information from all cores is combined into a single trace stream and output to a trace port analyser in real time. An ID embedded in the trace allows the analyzer to identify the source of each information packet.
- Code and hardware instrumentation via the trace port

  Software “printf” data from the processors, memory content via DMA, and hardware event trace information can be generated using the system trace macrocell. The information is combined with the processor trace stream and output to a trace port analyzer in real time.
- Capturing trace continuously in a circular buffer

  Instead of streaming it off-chip, the combined trace information can be stored on-chip in a circular buffer. The trace storage can be started and stopped by a debugger command, a software command, an external trigger signal, an internal event, etc.
- Draining the buffer to the trace port

  The stored trace can be dumped off-chip to the trace port analyzer. The buffer draining can be initiated by the debugger, software, external trigger, internal event etc.
- Reading the buffer with the debugger

  The debugger can read the contents of the trace buffer via the debug port. This is slower than the trace port, but allows basic trace functionality on the debugger without the cost of a trace port analyzer.
- Self-hosted trace analysis

  The trace buffer can be read by any of the processor cores, or transferred into system memory by DMA. This powerful feature allows built-in test software to perform real-time

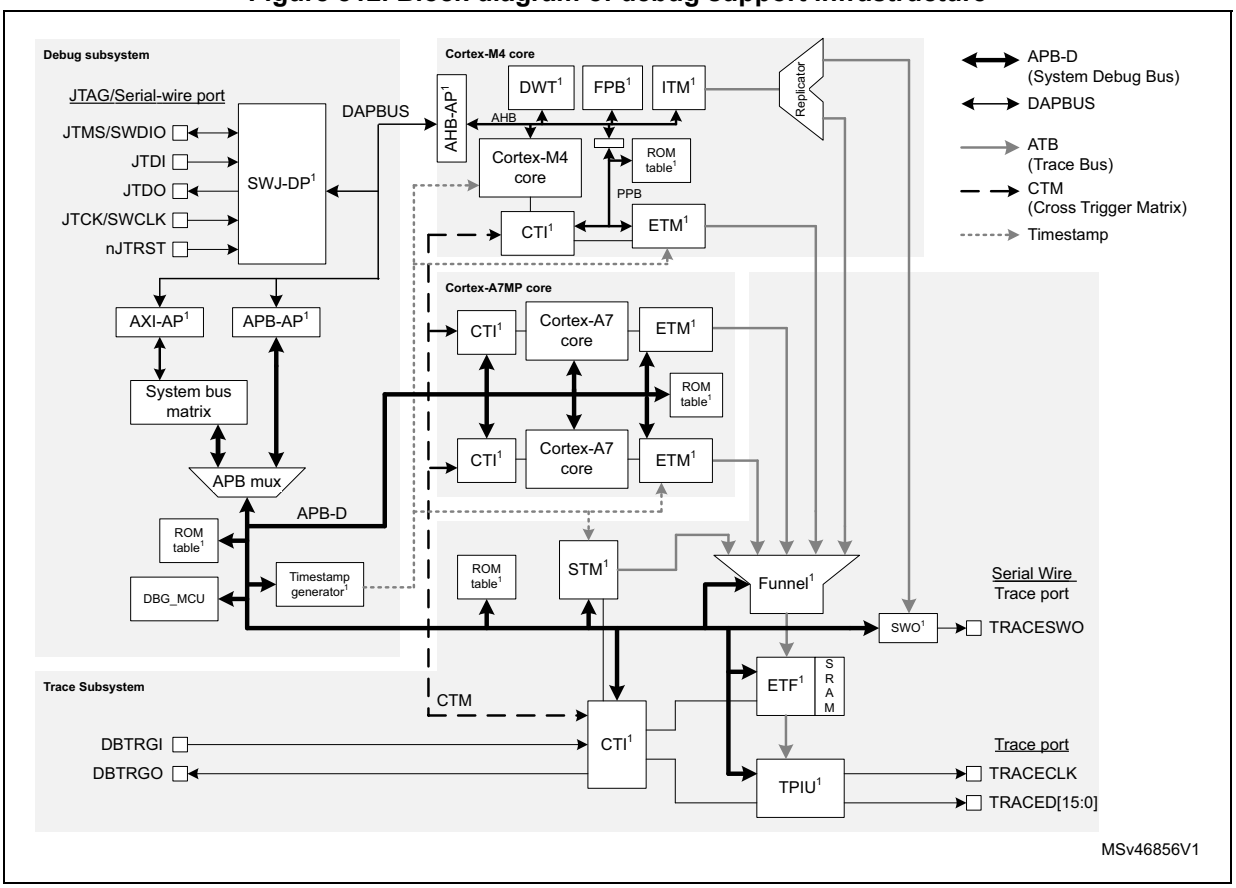
code execution monitoring, fault analysis and identification, autonomous exception handling, and others.

- Uploading stored trace

  The stored trace can also be uploaded to a host machine using one of the MPU's many communications interfaces (such as USB, USART, SPI, I2C, Ethernet, CAN, and others). This is especially useful if the trace port is not accessible, for example remote monitoring and failure analysis of a deployed product.

## 66.3 DBG block diagram

**Figure 812. Block diagram of debug support infrastructure**



1. Arm® CoreSight™ component

## 66.4 DBG pins

**Table 538. JTAG/Serial-wire debug port pins**

| Pin name | JTAG debug port | | SW debug port | | Pin assignment |
|---|---|---|---|---|---|
| | Type | Description | Type | Description | |
| JTMS/SWDIO | I | JTAG test mode select | IO | Serial wire data in/out | Refer to datasheet |
| JTCK/SWCLK | I | JTAG test clock | I | Serial wire clock | |
| JTDI | I | JTAG test data input | - | - | |
| JTDO | O | JTAG test data output | - | - | |
| nJTRST | I | JTAG test reset | - | - | |

**Table 539. Trace port pins**

| Pin name | Type | Description | Pin assignment |
|---|---|---|---|
| TRACED[15:0] | O | Trace synchronous data out (can be 1, 2, 4, 8 or 16 pins) | Refer to datasheet |
| TRACECLK | O | Trace clock | |

**Table 540. Serial Wire Trace port pins**

| Pin name | Type | Description | Pin assignment |
|---|---|---|---|
| TRACESWO | O | Trace asynchronous data out | Refer to datasheet(1) |

1. TRACESWO is multiplexed with JTDO. This means that single wire trace is only available when using the serial wire debug interface, not when using JTAG

**Table 541. Trigger pins**

| Pin name | Type | Description | Pin assignment |
|---|---|---|---|
| DBTRGI | I | External trigger input to CTI | Refer to datasheet |
| DBTRGO | O | External trigger output from CTI | |
| DBTRGIO | IO | External Trigger Bi-directional(1) | |

1. DBTRGIO can be configured as an input or an output by the TRGOEN bit in the DBGMCU_CR register. If configured as an input, it is connected to DBTRGI. If an output, it is connected to DBTRGO. This is because DBTRGI and DBTRGO are not available on certain packages.

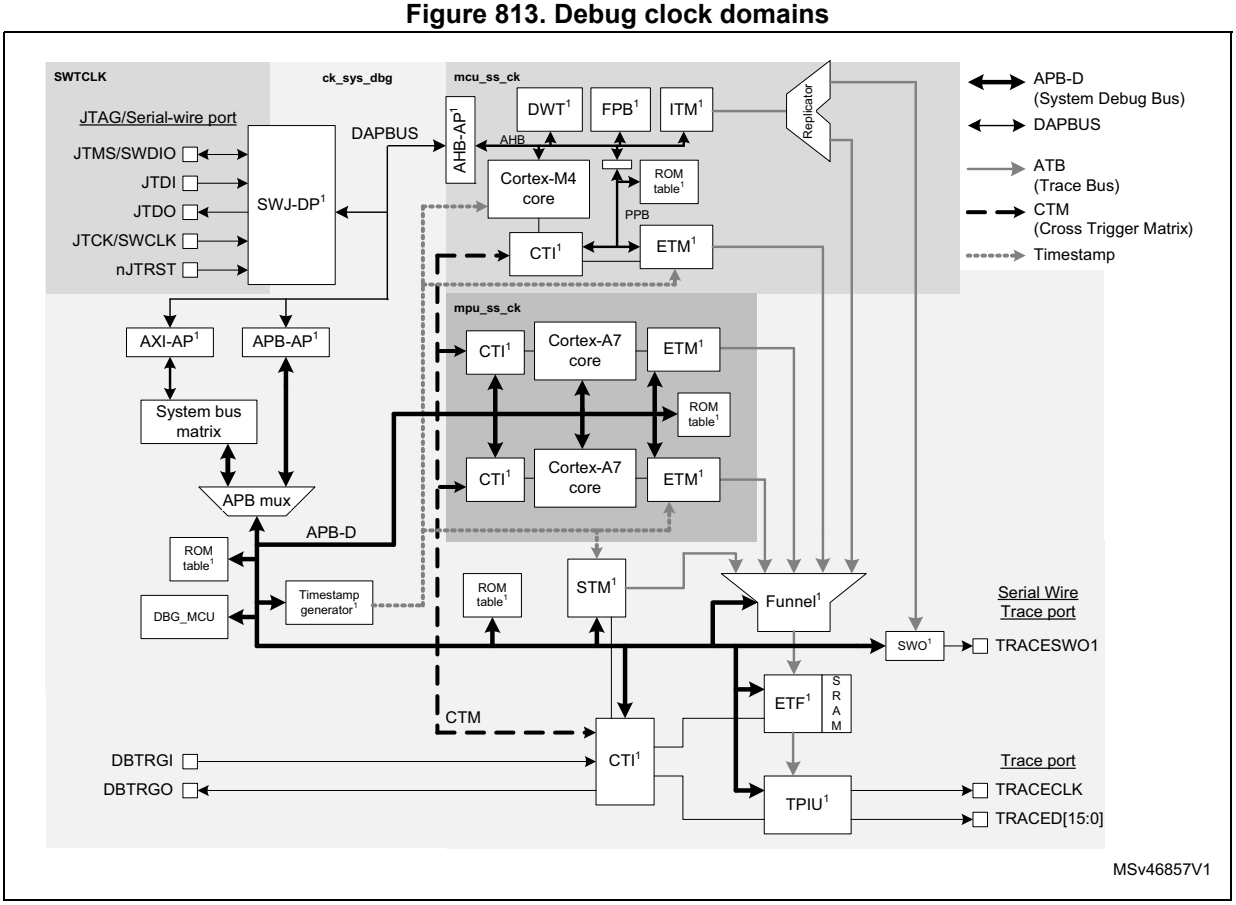
## 66.5 DBG power and clocking

### 66.5.1 DBG power domains

All debug components including the SWJ-DP are in the core power domain. This means that the debugger is not able to wake the device from Standby mode.

### 66.5.2 DBG clocks

**Figure 813. Debug clock domains**



1. Arm® CoreSight™ component

The debugger supplies the clock for the debug port, SWTCLK, via the debug interface pin, JTCK/SWCLK. This clock is used to register the serial input data in both serial wire and JTAG mode, as well as to operate the state machines and internal logic of the debug port. It must therefore continue to toggle for several cycles after the end of an access, to ensure that the debug port returns to the idle state.

The SWJ-DP contains an asynchronous interface to the system debug clock domain, ck_sys_dbg. The remainder of the debug subsystem, as well as the trace subsystem, is in this domain. ck_sys_dbg is a gated version of the AXI bus clock, aclk.

The clock is enabled by the debugger using the CDBGPWRUPREQ bit in the debug port CTRL/STAT register. It can also be enabled by software writing bit DBGCKEN in RCC debug configuration register (RCC_DBGCFGR). The clock must be enabled before the debugger or software can access any of the debug features on the device. It should be disabled when debug and trace are not used to avoid wasting energy.

The APB-D (debug APB bus) clock (ck_apb_dbg) runs at half of the ck_sys_dbg frequency. Some of the CoreSight™ components on this bus operate at the APB-D frequency, notably the timestamp generator (TSGEN).

The trace port (TPIU) output clock, ck_trace, is generated using TRACEDIV programmable divider in RCC debug configuration register (RCC_DBGCFGR). Its maximum frequency is

half that of ck_sys_dbg. The trace_ck signal is output on the TRACECLK GPIO pin when it is configured for trace function. The same clock is used to drive the serial wire output (SWO).

*Note: TRACECLK is enabled by setting TRACECKEN to 1 in RCC debug configuration register (RCC_DBGCFGR). It should be activated whenever tracing is required, even if neither the TPIU nor the SWO are active (that is when using the embedded trace FIFO as a software buffer). This is to avoid filling up the SWO FIFO which would then block the trace output from the ITM in the Cortex®-M4.*

The debug and trace components included in the processors (ETM, ITM, DWG, FPB, CTI etc) are clocked with the corresponding core clock (mpu_ss_ck for the Cortex®-A7 subsystem, mcu_ss for the Cortex®-M4 subsystem).

### 66.5.3 Debug and low-power modes

The STM32MP15 device includes power saving features which allow the various domain clocks and even the core power to be switched off when not required. If the core power is switched off (Standby mode), or the system debug domain is not clocked (Stop mode), all debug components will be inaccessible to the debugger. To avoid this, power saving mode emulation has been implemented. If emulation is enabled, the device still enters the programmed low power mode, but its clock and power are maintained. In other words, the domain behaves as if it is in low power mode, but the debugger does not lose the connection.

Emulation mode is programmed in the MCU Debug (DBGMCU) unit. For more information, refer to *Chapter 66.10.8*.

If the device is in Stop mode (ie. all clocks off) without emulation and the debugger wishes to wake the system up, it can do so by asserting the CDBGPWRUPREQ bit in the debug port CTRL/STAT register. This restarts the clocks (and switches on the high power regulator if needed) but does not generate any interrupt or event to either processor core. When the wake-up has completed, the CDBGPWRUPACK bit in the same register will go high. In this state the debugger can access the memories and peripheral registers, and trigger a wakeup of the CPUs if required.

### 66.5.4 DBG reset

The debug components, except for the debug port, are reset by their respective clock domain resets. The debug port (SWJ-DP) is reset by the nTRST or vcore_rst resets.. The access ports can be reset under debugger control, using the CDBGRSTREQ/ACK bits in the CTRL/STAT register of the debug port.

The debugger sets the CDBGRSTREQ bit to request a reset. It then polls the CDBGRSTACK bit until it goes high, indicating that the reset has completed, following which it deasserts the CDBGRSTREQ bit.

## 66.6 Security

The trace and debug components allow a high degree of access to the processor and system during product development. In order to protect user code and ensure that the debug features can not be used to alter or compromise the normal operation of the finished product, these features can be disabled, or limited in scope. For example, secure software debug and trace can be disabled without preventing the debug of non-secure code.

### 66.6.1 Authentication signals

There are six authentication signals used by the system to determine what features are enabled or disabled. These signals controlled in the BSEC debug configuration (BSEC_DENABLE) are:

- **deviceen**: controls access to debug components via the external debug port.
  0: external debugger has no access to debug components. Debugger access to system interconnect is not affected.
  1: external debugger has access to debug components
- **dbgen**: global enable for all debug and trace features
  0: all debug features are disabled. External and software access to debug components is still possible. External access to system interconnect is disabled.
  1: debug features in non-secure mode are enabled. External access to non-secure system interconnect is enabled. Debug features in secure mode and external access to secure system interconnect are dependent on the state of the **spiden** signal.
- **spiden**: enables debug in secure privileged mode when **dbgen** = 1
  0: debug features are disabled in secure privileged mode. External access to secure system interconect is disabled.
  1: debug features are enabled in secure privileged mode. External access to secure system interconnect is enabled.
- **niden**: enables trace and performance monitoring (non-invasive debug)
  0: trace generation is disabled.
  1: trace generation in non-secure mode is enabled. Trace generation in secure privileged mode is dependent on the state of the **spniden** signal.
- **spniden**: enables trace and performance monitoring in secure privileged mode when **niden** = 1.
  0: trace generation is disabled in secure privileged mode.
  1: trace generation is enabled in secure privileged mode.
- **dbgswenable**: enables self-hosted debug
  0: software access to all debug components is disabled
  1: software access to all debug components is enabled

*Table 542* lists which signals are connected to which debug and trace components.

**Table 542. Authentication signal connectivity**

| | deviceen | dbgen | spiden | niden | spniden | dbgswenable |
|---|---|---|---|---|---|---|
| Debug APB-AP | X | - | - | - | - | X |
| Cortex®-M4 AHB-AP | X(1) | X | - | - | - | - |
| System bus AXI-AP | - | X | X | - | - | - |
| Cortex®-M4 DWT/FPB/SCS/ITM | - | X | - | - | - | - |
| Cortex®-M4 ETM | - | - | - | X | - | - |
| Cortex®-M4 CTI | - | X | - | X | - | - |
| Cortex®-A7 MPCore Debug unit | - | X | X | X | X | X |
| Cortex®-A7 MPCore ETM | - | X | - | X | - | - |

**Table 542. Authentication signal connectivity (continued)**

| | deviceen | dbgen | spiden | niden | spniden | dbgswenable |
|---|---|---|---|---|---|---|
| Cortex®-A7 MPCore CTI | - | X | - | X | - | - |
| STM | - | X | X | X | X | - |

1. **deviceen** connects to DAPEN in the Cortex®-M4

For detailed information on the behavior of each component according to the state of the authentication signals, refer to the relevant component chapter, or to the relevant Arm® technical documentation.

The initial state of the signals are set at power-on reset, according to *Table 543*. The state of the signals can be modified in the BSEC debug configuration (BSEC_DENABLE) register after boot-up by software with secure privileged access rights.

**Table 543. Authentication signal initial states**

| Device state (set by OTP fuse) | Authentication signal default state | Description |
|---|---|---|
| Development device | All ones | All debug and trace is enabled at boot-up. |
| Production device | All zeros | All debug and trace is disabled at boot-up. Secure software should enable debug as required after booting. |

## 66.7 Chip Level TAP Controller (CLTAPC)

The JTAG interface is connected to the internal scan chain of the IC. It is used for testing as well as for debug. The first component in the scan chain is the Chip Level TAP Controller which implements a TAP state machine based on IEEE Std 1149.1-1990. It allows access to the built-in manufacturing test features.

The CLTAPC must be bypassed in order to access the debug support functions provided by the SWJ-DP. This is done by prefixing the SWJ-DP instructions with the CLTAPC bypass instruction sequence: 11111.

The CLTAPC also contains three 16-bit registers which can be accessed using the CTRL instruction sequence: 01000, followed by 1111 to bypass the SWJ-DP. Next, the register address is shifted into the DR (LSB first). Finally, the 16-bit register content is shifted into or out of the DR, according to whether the register is read or write.

The CLTAPC registers are listed in *Table 544*.

**Table 544. CLTAPC registers**

| Name | Address | Description | Read/Write |
|---|---|---|---|
| SECSTS | 001 | Status of the BSEC_DENABLE register | R |
| DBGCTL | 010 | Connected to BSEC_JTAGIN register | W |
| DBGSTS | 011 | Connected to BSEC_JTAGOUT register | R |

For details of the BSEC register bits, refer to *Section 3: Boot and security and OTP control (BSEC)*.

## 66.8 Serial wire and JTAG debug port (SWJ-DP)

The SWJ-DP is a CoreSight™ component that implements an external access port for connecting debugging equipment.

Two types of interface can be configured:

- A 5-pin standard JTAG interface (JTAG-DP)
- A 2-pin (clock + data) “serial-wire debug” port (SW-DP)

The two modes are mutually exclusive, since they share the same IO pins.

By default the JTAG-DP is selected after a system or power-on reset. The five IO pins are configured by hardware in debug alternative function mode. The SWJ-DP incorporates pull-up resistors on JTDI, JTMS/SWDIO, and nJTRST, as well as a pull-down resistor on JTCK/SWCLK.

A debugger can select the SW-DP by transmitting the following serial data sequence on JTMS/SWDIO:

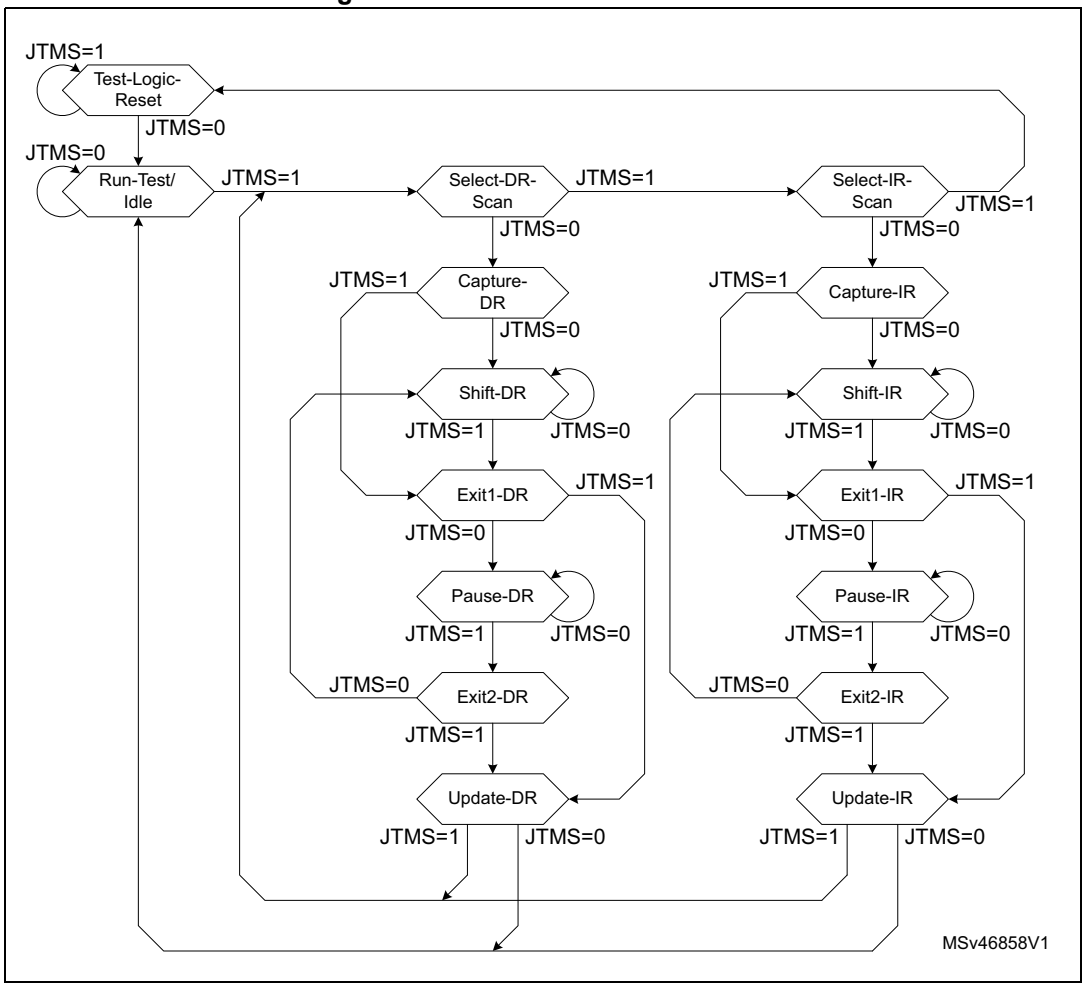
...(50 or more ones)...,0,1,1,1,1,0,0,1,1,1,1,0,0,1,1,1,...(50 or more ones)...

JTCK/SWCLK must be cycled for each data bit.

In SW-DP mode, the unused JTAG pins JTDI, JTDO and nJTRST can be used for other functions. It should be noted that all SWJ port IOs can be reconfigured to other functions by software, but debugging will no longer be possible.

### 66.8.1 JTAG debug port

**Figure 814. JTAG TAP state machine**



The JTAG-DP implements a TAP state machine (TAPSM) based on IEEE Std 1149.1-1990. The state machine is shown in *Figure 814*. The state machine controls two scan chains, one associated with an instruction register (IR) and one with a number of data registers (DR).

The operation of the JTAG-DP is as follows:

When the TAPSM goes through the Capture-IR state, 0001 is transferred onto the Instruction Register (IR) scan chain. The IR scan chain is connected between JTDI and JTDO.

While the TAPSM is in the Shift-IR state, the IR scan chain shifts one bit for each rising edge of JTCK. This means that on the first tick:

– The LSB of the IR scan chain is output on JTDO.
– Bit[n] of the IR scan chain is transferred to bit[n-1].
– The value on JTDI is transferred to the MSB of the IR scan chain.

When the TAPSM goes through the Update-IR state, the value scanned into the IR scan chain is transferred into the Instruction Register.

When the TAPSM goes through the Capture-DR state, a value is transferred from one of the Data Registers onto one of the DR scan chains, connected between JTDI and JTDO.

The value held in the Instruction Register determines which Data Register, and associated DR scan chain, is selected.

This data is then shifted while the TAPSM is in the Shift-DR state, in the same manner as the IR shift in the Shift-IR state.

When the TAPSM goes through the Update-DR state, the value scanned into the DR scan chain is transferred into the selected Data Register.

When the TAPSM is in the Run-Test/Idle state, no special actions occur. The IDCODE instruction is loaded in IR.

The nJTRST signal when active resets the state machine asynchronously to the Test-Logic-Reset state.

The Data registers corresponding to the 4-bit IR instructions are listed in *Table 545*.

**Table 545. JTAG-DP data registers**

| IR instruction | DR register | Scan chain length | Description |
|---|---|---|---|
| 0000 to 0111 | (BYPASS) | 1 | Not implemented: BYPASS selected |
| 1000 | ABORT | 35 | ABORT register<br>– Bits 31:1 = Reserved<br>– Bit 0 = APABORT: write 1 to generate a AP abort. |
| 1001 | (BYPASS) | 1 | Reserved: BYPASS selected |

**Table 545. JTAG-DP data registers (continued)**

| IR instruction | DR register | Scan chain length | Description |
|---|---|---|---|
| 1010 | DPACC | 35 | Debug port access register<br>Initiates the debug port and allows access to a debug port register.<br>– When transferring data IN:<br>Bits 34:3 = DATA[31:0] = 32-bit data to transfer for a write request<br>Bits 2:1 = A[3:2] = 2-bit address of a debug port register.<br>Bit 0 = RnW = Read request (1) or write request (0).<br>– When transferring data OUT:<br>Bits 34:3 = DATA[31:0] = 32-bit data which is read following a read request<br>Bits 2:0 = ACK[2:0] = 3-bit Acknowledge:<br>010 = OK/FAULT<br>001 = WAIT<br>Others = Reserved |
| 1011 | APACC | 35 | Access port access register<br>Initiates an access port and allows access to an access port register.<br>– When transferring data IN:<br>Bits 34:3 = DATA[31:0] = 32-bit data to shift in for a write request<br>Bits 2:1 = A[3:2] = 2-bit sub-address of an access port register.<br>Bit 0 = RnW= Read request (1) or write request (0).<br>– When transferring data OUT:<br>Bits 34:3 = DATA[31:0] = 32-bit data which is read following a read request<br>Bits 2:0 = ACK[2:0] = 3-bit Acknowledge:<br>010 = OK/FAULT<br>001 = WAIT<br>Others = Reserved |
| 1100 | (BYPASS) | 1 | Reserved: BYPASS selected |
| 1101 | (BYPASS) | 1 | Reserved: BYPASS selected |

| 1111 | BYPASS | 1 | Bypass<br>A single JTCK cycle delay is inserted between JTDI and JTDO |

The DR registers are described in more detail in the *Arm® Debug Interface Architecture Specification [1]*.

### 66.8.2 SW debug port

The Serial Wire Debug protocol uses the two pins:

- SWCLK: clock from host to target
- SWDIO: bi-directional serial data (100 kOhm pull-up required)

Serial data is transferred LSB first, synchronously with the clock. A transfer comprises three phases:

1. Packet request (8 bits) transmitted by the host
2. Acknowledge response (3 bits) transmitted by the target.
3. Data transfer (33 bits) transmitted by the host (in the case of a write) or target (in the case of a read).

The data transfer only occurs if the acknowledge response is OK.

Between each phase, if the direction of the data is reversed, a single clock cycle turn-around time is inserted.

**Table 546. Packet request**

| Bit field | Name | Description |
|---|---|---|
| 0 | Start | Must be 1 |
| 1 | APnDP | 0: DP register access - see *Table 549* for a list of DP registers<br>1: AP register access - see *Section 66.9* |
| 2 | RnW | 0: write request<br>1: read request |
| 4:3 | A(3:2) | Address field of the DP or AP register (refer to *Table 549*) |
| 5 | Parity | Single bit parity of preceding bits |
| 6 | Stop | 0 |
| 7 | Park | Not driven by host. Must be read as 1 by target. |

**Table 547. ACK response**

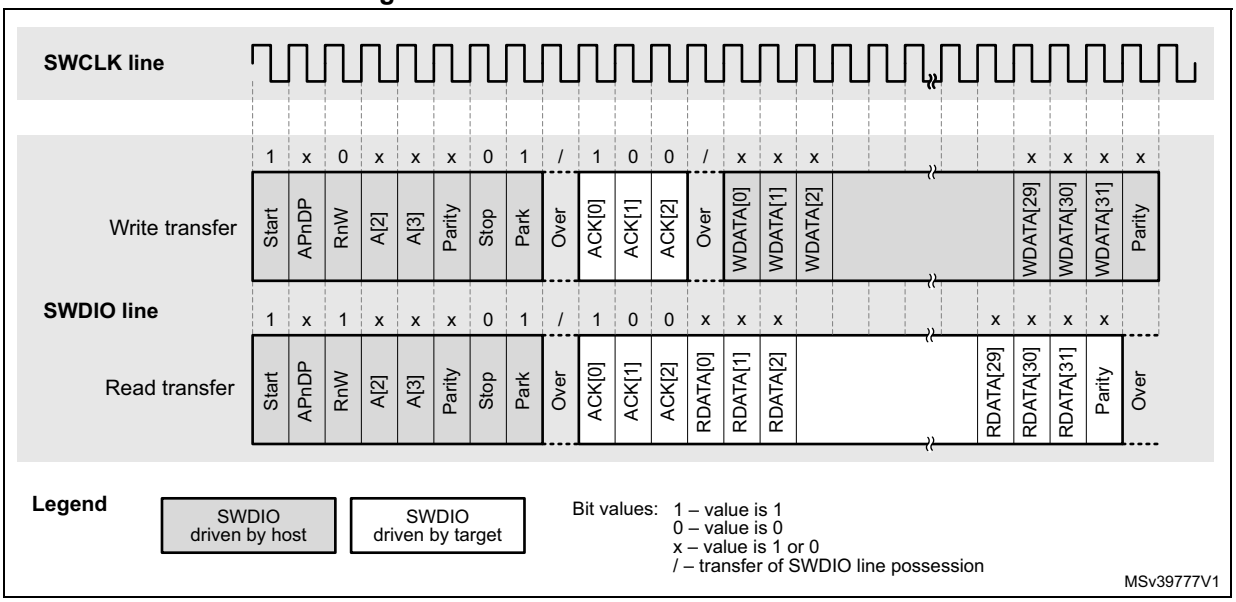
| Bit field | Name | Description |
|---|---|---|
| 2:0 | ACK | 000: FAULT<br>010: WAIT<br>100: OK |

**Table 548. Data transfer**

| Bit field | Name | Description |
|---|---|---|
| 31:0 | WDATA or RDATA | Write or read data |
| 32 | Parity | Single bit parity of 32 data bits |

*Figure 815* shows examples of successful write and read transfers.

**Figure 815. SWD successful data transfer**



In the case of a FAULT or WAIT ACK response from the target, the data transfer phase is cancelled, unless overrun detection is enabled, in which case the data will be ignored by the target (in the case of a write), or not driven (in the case of a read).

A line reset must be generated by the host when it is first connected, or following a protocol error. The line reset consists of 50 or more SWCLK cycles with SWDIO high, followed by two SWCLK cycles with SWDIO low.

For more details on the Serial Wire debug protocol, refer to the *Arm® Debug Interface Architecture Specification [1]*.

*Note: The SWJ-DP implements SWD protocol version 2*

### 66.8.3 Debug port registers

The SW-DP and JTAG-DP both access the debug port (DP) registers. These are listed in *Table 549*.

The debugger can access the DP registers as follows:

1. Program the DPBANKSEL field in the DP_SELECT data port register to select the register bank to be accessed (see *Table 549*).
2. Program the A(3:2) field in the DPACC register, if using JTAG, with the register address within the bank.
3. Program the RnW bit to select a Read or Write.
4. In the case of a write, program the DATA field with the write data.

If using SWD, the A(3:2) and RnW fields are part of the Packet Request word sent to the SW-DP with the APnDP bit reset (see *Table 546*). The write data is sent in the data phase.

**Table 549. Debug port registers**

| Address | A(3:2) value | R/W | Description |
|---|---|---|---|
| 0x0 | 00 | R | DP_DPIDR register. Contains the IDCODE for the debug port |
| | | W | DP_ABORT register(1). Aborts the current AP transaction. This register is also used to clear the error flags in the DP_CTRLSTAT register. |
| 0x4 | 01 | R/W | If field DPBANKSEL of register DP_SELECT is 0: DP_CTRLSTAT register. Controls the DP and provides status information. |
| | | | If field DPBANKSEL of register DP_SELECT is 1: DP_DLCR register(2). Controls the operating mode of the SWD data link. |
| | | | If field DPBANKSEL of register DP_SELECT is 2: DP_TARGETID register. Provides target identification information. |
| | | | If field DPBANKSEL of register DP_SELECT is 3: DP_DLPIDR register(3). Provides the SWD protocol version. |
| 0x8 | 10 | R | DP_RESEND register(4). Returns the value that was returned by the last AP read or DP RDBUFF read. Used in the event of a corrupted read transfer. |
| | | W | DP_SELECT register. Selects the access port, access port register bank, and DP register at address 0x4. |
| 0xC | 11 | R | DP_RDBUFF register:<br>Via JTAG-DP - Used to allow the debugger to get the final result after a sequence of operations (without requesting new JTAG-DP operation)<br>Via SW-DP - Contains the result of the preceding AP read access, allowing a new AP access to be avoided. |
| | | W | DP_TARGETSEL register(5). On a write to DP_TARGETSEL immediately following a line reset sequence, the target is selected if both the following conditions are met:<br>Bits [31:28] match bits [31:28] in the DP_DLPIDR.<br>Bits [27:0] match bits [27:0] in the DP_TARGETID register.<br>Writing any other value de-selects the target. Debug tools must write 0xFFFF FFFF to de-select all targets. This is an invalid TARGETID value. All other invalid TARGETID values are reserved. |

1. Access to the AP DP_ABORT register from the JTAG-DP is done using the ABORT instruction.
2. Only accessible via SW-DP. Register is “Reserved” via JTAG-DP.
3. Only accessible via SW-DP. Register is “Reserved” via JTAG-DP.
4. Only accessible via SW-DP. Register is “Reserved” via JTAG-DP.
5. Only accessible via SW-DP. Register is “Reserved” via JTAG-DP.

### DP debug port identification register (DP_DPIDR)

Address offset: 0x0

Reset value: 0x6BA0 2477

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 **REVISION[3:0]**: revision code
0x6

Bits 27:20 **PARTNO[7:0]**: debug port part number
0xBA

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **MIN:** minimal debug port implementation
0x0: minimal debug port (MINDP) not implemented (transaction counter and pushed operations are supported)

Bits 15:12 **VERSION[3:0]**: DP architecture version
0x2: DPv2

Bits 11:1 **DESIGNER[10:0]**: JEDEC designer identity code
0x23B: Arm®

Bit 0 Reserved, must be kept at reset value.

### DP abort register (DP_ABORT)

Address offset: 0x0

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ORUNERRCLR | WDERRCLR | STKERRCLR | STKCMPCLR | DAPABORT |
| | | | | | | | | | | | w | w | w | w | w |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **ORUNERRCLR**: overrrun error clear
0: no effect
1: clears bit STICKYORUN of register DP_CTRLSTAT

Bit 3 **WDERRCLR**: write data error clear
0: no effect
1: clears bit WDATAERR of register DP_CTRLSTAT

Bit 2 **STKERRCLR**: sticky error clear
0: no effect
1: clears bit STICKYERR of register DP_CTRLSTAT

Bit 1 **STKCMPCLR**: sticky compare clear
0: no effect
1: clears bit STICKYCMP of register DP_CTRLSTAT

Bit 0 **DAPABORT**: current AP transaction abort
If an excessive number of WAIT responses are returned, indicating that the transaction has stalled, the current AP transaction is aborted.
0: no effect
1: aborts transaction

### Debug port control/status register (DP_CTRLSTAT)

Address offset: 0x4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | CDBGPWRUPACK | CDBGPWRUPREQ | CDBGRSTACK | CDBGRSTREQ | Res. | Res. | TRNCNT[11:4] | | | | | | | |
| | | r | rw | r | rw | | | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TRNCNT[3:0] | | | | MASKLANE[3:0] | | | | WDATAERR | READOK | STICKYERR | STICKYCMP | TRNMODE[1:0] | | STICKYORUN | ORUNDETECT |
| rw | rw | rw | rw | rw | rw | rw | rw | r | r | rw | rw | rw | rw | rw | rw |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **CDBGPWRUPACK**: debug power up acknowledge
Status of the debug domain power up acknowledge signal from the power controller.
0: domain powered down
1: domain powered up

Bit 28 **CDBGPWRUPREQ**: debug power up request
Controls the debug domain power up request signal to the power controller.
0: request power down
1: request power up

Bit 27 **CDBGRSTACK**: debug reset acknowledge
Status of the debug domain reset acknowledge signal from the reset controller.
0: domain reset inactive/pending
1: domain reset complete

Bit 26 **CDBGRSTREQ**: debug reset request
Controls the debug domain reset request signal to the reset controller.
0: de-assert reset request/request inactive
1: assert reset request/request active

Bits 25:24 Reserved, must be kept at reset value.

Bits 23:12 **TRNCNT[11:0]**: transaction counter
To program a sequence of transactions to incremental addresses via an AP, TRNCNT is loaded with the number of transactions to perform. It is decremented at the successful completion of each transaction.

Bits 11:8 **MASKLANE[3:0]**: lane comparison mask
Indicates the bytes to be masked in pushed-compare and pushed-verify operations (when bit TRNMODE of register DP_CTRLSTAT is 1 or 2). In the pushed operations, the word supplied in an AP write transaction is compared with the current value at the target AP address.
1XXX: includes byte lane 3 in comparisons
X1XX: includes byte lane 2 in comparisons
XX1X: includes byte lane 1 in comparisons
XXX1: includes byte lane 0 in comparisons

Bit 7 **WDATAERR**: write data error in SW-DP
Indicates any of the following cases:
– there is a a parity or framing error on the data phase of a write
– a write that has been accepted by the DP is then discarded without being submitted to the AP
This bit is reset by writing 1 to the WDERRCLR bit of the DP_ABORT register.
0: no error
1: error has occurred
*Note: This bit is reserved in JTAG-DP.*

Bit 6 **READOK**: AP read response in SW-DP
Indicates the response to the last AP read access.
0: read not OK
1: read OK
*Note: This bit is reserved in JTAG-DP.*

Bit 5 **STICKYERR**: transaction error(1)
Indicates that an error occurred in an AP transaction.
0: no error
1: error has occurred
In the SW-DP, this bit is reset by writing 1 to the STKERRCLR bit of the DP_ABORT register.
In the JTAG-DP, this bit is reset by writing a 1 to it.

Bit 4 **STICKYCMP**: compare match(1)
Indicates that a match occurred in a pushed operation.
0: match if TRNMODE = 0x1; no match if TRNMODE = 0x2
1: no match if TRNMODE = 0x1; match if TRNMODE = 0x2
In the SW-DP, this bit is reset by writing 1 to the STKCMPCLR bit of the DP_ABORT register.
In the JTAG-DP, this bit is reset by writing a 1 to it.

Bits 3:2 **TRNMODE[1:0]**: transfer mode for AP write operations
For read operations, this field must be set to 0.
0: normal operation. AP transactions are passed directly to the AP.
1: pushed-verify operation. The DP stores the write data and performs a read transaction at the target AP address. The result of the read is compared with the stored data and if they do not match, the STICKYCMP bit is set.
2: pushed-compare operation. The DP stores the write data and performs a read transaction at the target AP address. The result of the read is compared with the stored data and if they match, the STICKYCMP bit is set.
3: reserved
In pushed operation, only the data bytes indicated by the MASKLANE field are included in the compare.

Bit 1 **STICKYORUN**: overrun(1)
Indicates that an overrun occurred (new transaction received before previous transaction completed). This bit is only set if the ORUNDETECT bit is set.
0: no overrun
1: overrun occurred
In the SW-DP, this bit is reset by writing 1 to the ORUNERRCLR bit of the DP_ABORT register. In the JTAG-DP, this bit is reset by writing a 1 to it.

Bit 0 **ORUNDETECT**: overrun detection mode enable
0: overrun detection disabled
1: overrun detection enabled. In the event of an overrun, the STICKYORUN bit will be set and subsequent transactions will be blocked until the STICKYORUN bit is cleared.

1. Access type is ‘r’ in SW-DP and ‘rw’ in JTAG-DP.

### DP data link control register (DP_DLCR)

Address offset: 0x4

Reset value: 0x0000 0040

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | |

Bits 31:28 **TREVISION[3:0]**: target revision
0x2: Rev. B

Bits 27:12 **TPARTNO[15:0]**: target part number
0x5000: STM32MP15xxx

Bits 11:1 **TDESIGNER[10:0]**: target designer JEDEC code
0x020: STMicroelectronics

Bit 0 Reserved, must be kept at reset value.

### DP data link protocol identification register (DP_DLPIDR)

Address offset: 0x4

Reset value: 0x0000 0001

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TINSTANCE[3:0] | | | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| r | r | r | r | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PROTSVN[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:28 **TINSTANCE[3:0]**: target instance number
Defines the instance number for this device in a multi-drop system.
0x0: instance 0

Bits 27:4 Reserved, must be kept at reset value.

Bits 3:0 **PROTSVN[3:0]**: Serial Wire Debug protocol version
0x1: version 2

### DP resend register (DP_RESEND)

Address offset: 0x8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RESEND[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RESEND[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RESEND[31:0]**: last AP read or DP_RDBUFF read value

Returns the value that was returned by the last AP read or DP_RDBUFF read. Used in the event of a corrupted read transfer.

### DP access port select register (DP_SELECT)

Address offset: 0x8

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| APSEL[3:0] | | | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| w | w | w | w | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | APBANKSEL[3:0] | | | | DPBANKSEL[3:0] | | | |
| | | | | | | | | w | w | w | w | w | w | w | w |

Bits 31:28 **APSEL[3:0]**: access port select

Selects the access port for the next transaction.
0x0: AP0 - System bus access port (AXI-AP)
0x1: AP1 - Debug bus access port (APB-AP)
0x2: AP2 - Cortex®-M4 debug access port (AHB-AP)

Bits 27:8 Reserved, must be kept at reset value.

Bits 7:4 **APBANKSEL[3:0]**: AP register bank select

Selects the 4-word register bank on the active AP for the next transaction.

Bits 3:0 **DPBANKSEL[3:0]**: DP register bank select

Selects the register at address 0x4 of the debug port.
0x0: DP_CTRLSTAT register
0x1: DP_DLCR register
0x2: DP_TARGETID register
0x3: DP_DLPIDR register
Others: reserved

### DP read buffer register (DP_RDBUFF)

Address offset: 0xC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RDBUFF[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RDBUFF[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RDBUFF[31:0]**: **l**ast AP read access value

Contains the value that was returned by the last AP read access. The value returned by an AP read access can either be obtained using a second read access to the same address, which will initiate a new transaction on the corresponding bus, or else it can be read from this register, in which case no new AP transaction occurs.

### DP target identification register (DP_TARGETSEL)

Address offset: 0xC

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TINSTANCE[3:0] | | | | TPARTNO[15:4] | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TPARTNO[3:0] | | | | TDESIGNER[10:0] | | | | | | | | | | | Res. |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | |

Bits 31:28 **TINSTANCE[3:0]**: target instance number

Defines the instance number for the target device in a multi-drop system. These bits must be written with the same value as field TINSTANCE in register DP_DLPIDR in order to select this device.

Bits 27:12 **TPARTNO[15:0]**: target part number

Defines the part number for the target device. These bits must be written with the same value as field TPARTNO in register DP_TARGETID in order to select this device.

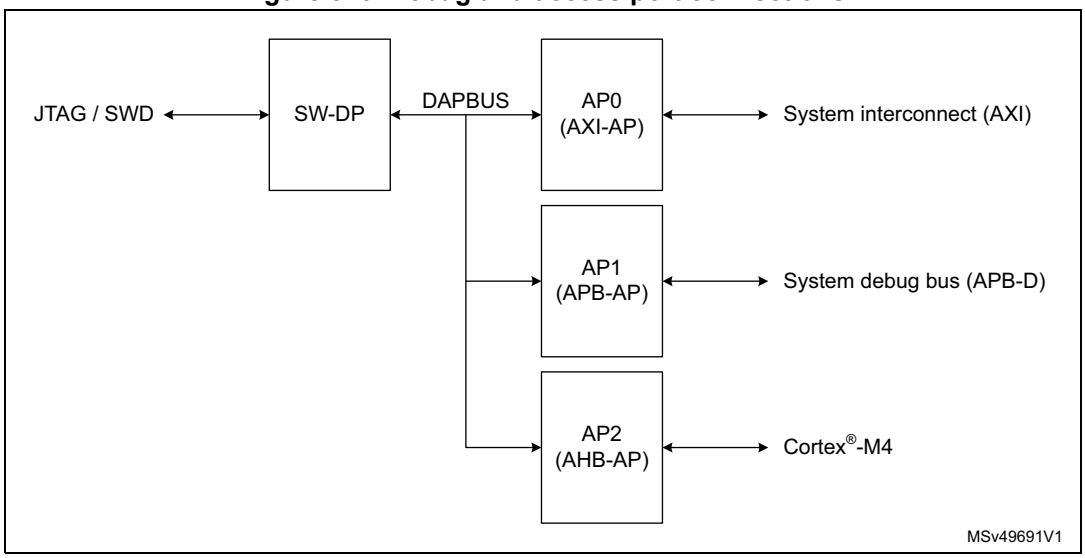
Bits 11:1 **TDESIGNER[10:0]**: target designer JEDEC code

Defines the JEDEC code for the target device. These bits must be written with the same value as field TDESIGNER in register DP_TARGETID in order to select this device.

Bit 0 Reserved, must be kept at reset value.

## 66.9 Access ports

**Figure 816. Debug and access port connections**



There are three access ports (AP) attached to the DP:

1. AP0: System bus access port (AXI-AP). Allows access to the system bus matrix. This gives visibility of all the memory and peripherals accessible via the AXI and AHB interconnects, except those on the system APB debug bus. No CoreSight™ components are accessible via this port.
2. AP1: Debug access port (APB-AP). Allows access to the CoreSight™ components on the debug APB bus, including the Cortex®-A7. The DBGMCU is also located on this bus.
3. AP2: Cortex®-M4 access port (AHB-AP). Allows access to the debug and trace features integrated in the Cortex®-M4 processor core via its PPB bus.

All three access ports are of type MEM-AP, that is to say the debug and trace component registers are mapped in the address space of the associated debug bus. The AP is seen by the debugger as a set of 32-bit registers organised in banks of four registers each. Some of these registers are used to configure or monitor the AP itself, while others are used to perform a transfer on the bus. The AP registers are listed in *Table 553*.

The address of the AP registers is composed of

- Bits [7:4]: contents of the DP_SELECT register APBANKSEL field in the DP (refer to *DP access port select register (DP_SELECT)*)
- Bits [3:2]: contents of the A(3:2) field of the APACC data register in the JTAG-DP (see *Table 545*) or of the SW-DP Packet Request (see *Table 546*), depending on the debug interface used
- Bits [1:0]: Always set to 0

The contents of the DP_SELECT register APSEL field in the DP define which MEM-AP is being accessed.

The debugger can access the AP registers as follows:

1. Program the DP_SELECT register APSEL field in the DP to choose one of the APs, and the APBANKSEL field to select the register bank to be accessed (refer to *DP access port select register (DP_SELECT)*).
2. Program the A(3:2) field in the APACC register, if using JTAG, with the register address within the bank. Program the RnW bit to select a Read or Write. In the case of a write, program the DATA field with the write data. If using SWD, the A(3:2) and RnW fields are part of the Packet Request word sent to the SW-DP with the APnDP bit set (see *Table 546*). The write data is sent in the data phase.

The debugger can access the memory mapped debug component registers through the MEM-AP registers (that is using the above AP register access procedure) as follows:

1. Program the transaction target address in the TAR register.
2. Program the CSW register, if necessary, with the transfer parameters (AddrInc for example).
3. Write to or read from the DRW register to initiate a bus transaction at the address held in the TAR register. Alternatively, a read or write to Banked Data register BDn will trigger an access to address TAR[31:4] + n (this allows up to four consecutive addresses to be accessed without changing the address in the TAR register).

For more detailed information on the MEM-AP, refer to the *Arm® Debug Interface Architecture Specification [1]*.

### 66.9.1 Authentication

The effect of the authentication signals for each access port is shown in *Table 550* to *Table 552*.

**Table 550. AP0 (system interconnect) authentication behavior**

| dbgen | spiden | Others | Behavior |
|---|---|---|---|
| 0 | X | X | All transfers blocked. Any attempt to perform a transfer will result in an error. |
| 1 | 0 | | Secure transfers blocked. Any attempt to perform a secure transfer will result in an error. Non-secure transfers are enabled. |
| 1 | 1 | | Both non-secure and secure transfers are enabled. |

**Table 551. AP1 (Debug APB) authentication behavior**

| deviceen | Others | Behavior |
|---|---|---|
| 0 | X | All transfers blocked. |
| 1 | | Transfers enabled. Note: access to certain components may return an error depending on the state of the other authentication signals. |

**Table 552. AP2 (Cortex®-M4) authentication behavior**

| deviceen[1] | dbgen | Others | Behavior |
|---|---|---|---|
| 0 | X | X | All transfers blocked. Any attempt to perform a transfer will result in an error. |
| X | 0 | | All transfers blocked. Any attempt to perform a transfer will result in an error. |
| 1 | 1 | | Transfers enabled. |

1. **deviceen** is connected to the DAPEN input of the Cortex®-M4

### 66.9.2 MEM-AP registers

**Table 553. MEM-AP registers**

| Address | APBANKSEL | A(3:2) | Name | Description |
|---|---|---|---|---|
| 0x00 | 0x0 | 0 | CSW | Control/Status Word register - Refer to section *AP0 control/status word register (AP0_CSW)* *AP1 control/status word register (AP1_CSW)* *AP2 control/status word register (AP2_CSW)* |
| 0x04 | 0x0 | 1 | TAR | Transfer Address register - Refer to section *AP transfer address register (AP_TAR)* |
| 0x08 | - | - | - | Reserved |
| 0x0C | 0x0 | 3 | DRW | Data Read/Write register - Refer to section *AP data read/write register (AP_DRW)* |
| 0x10 | 0x1 | 0 | BD0 | Banked Data 0 register - Refer to section *AP banked data register 0 (AP_BD0)* |
| 0x14 | 0x1 | 1 | BD1 | Banked Data 1 register - Refer to section *AP banked data register 1 (AP_BD1)* |
| 0x18 | 0x1 | 2 | BD2 | Banked Data 2 register - Refer to section *AP banked data register 2 (AP_BD2)* |
| 0x1C | 0x1 | 3 | BD3 | Banked Data 3 register - Refer to section *AP banked data register 3 (AP_BD3)* |
| 0x20 | 0x2 | 0 | ACE | ACE barrier transaction register (AXI-AP only) - Refer to section *AP ACE barrier transaction register (AP_ACE)* |
| 0x24-0xEC | - | - | - | Reserved |
| 0xF0 | - | - | - | Reserved |
| 0xF4 | 0xF | 1 | CFG | Configuration register (AXI-AP only) - Refer to section *AP configuration register (AP_CFG)* |
| 0xF8 | 0xF | 2 | BASE | Debug Base Address register (RO) - Refer to section *AP x base address register (APx_BASE) (x = 0 to 2)* |
| 0xFC | 0xF | 3 | IDR | Identification register (RO) - Refer to section *AP x identification register (APx_IDR) (x = 0 to 2)* |

### AP0 control/status word register (AP0_CSW)

Address offset: 0x0

Reset value: 0x3080 6042

For a detailed description of each field, refer to the *Arm AMBA protocol specifications for the corresponding bus [10.,11.,12.]*.

AP0 (AHB-AP):

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **PROT[2:0]**: bus transaction protection attributes
This field sets the AxPROT[2:0] protection attributes of the bus transaction.
XX0: unprivileged
XX1: privileged
X0X: secure
X1X: non-secure
0XX: data
1XX: instruction

Bits 27:24 **CACHE[3:0]**: bus transaction cache attributes
This field sets the AxCACHE[3:0] cache attributes of the bus transaction.
XXX0: non-bufferable
XXX1: bufferable
XX0X: non-modifiable (non-cacheable)
XX1X: modifiable (cacheable)
X0XX: no read-allocate
X1XX: read-allocate
0XXX: no write-allocate
1XXX: write-allocate

Bit 23 **SPISTATUS**: status of **spiden** authentication signal (read only)
This signal determines whether the debugger can access secure memory.
0: secure AXI transfers are blocked
1: secure AXI transfers are allowed

Bits 22:15 Reserved, must be kept at reset value.

Bits 14:13 **DOMAIN[1:0]**: shareable transaction attributes
This field defines the shareable attributes for an ACE transaction.
0x0: non-shareable
0x1: shareable, inner domain, includes additional masters
0x2: shareable, outer domain, also includes inner or additional masters
0x3: shareable, system domain, all masters included

Bit 12 **ACEENABLE**: ACE transactions enable, including barriers
0: disable
1: enable

Bits 11:8 **MODE[3:0]**: mode of operation
0x0: normal download or upload
0x1: barrier transaction
0x2-0xF: reserved

Bit 7 **TRINPROG**: transfer in progress (read only)
Indicates if a bus transfer is in progress on the AP.
0: no transfer in progress
1: bus transfer in progress

Bit 6 **DBGSTATUS**: status of DBGEN authentication signal (read only)
This signal determines whether the AXI bus can be accessed.
0: AXI transactions are blocked
1: AXI transactions are allowed

Bits 5:4 **ADDRINC[1:0]**: auto-increment and packing mode on RW data access
Only increments if the current transaction completes without an error response and the transaction is not aborted.
Auto address incrementing and packed data transfers are not performed on access to banked data registers 0x10-0x1C. The value of these bits is ignored in these cases.
If increment is enabled, the address wraps at 1-Kbyte address boundaries.
0x0: no auto-increment
0x1: address is incremented by the size in bytes of the transaction (SIZE field)
0x2: packed transfers enabled. A 32-bit AP access gives rise to 1 x 32-bit, 2 x 16-bit or 4 x 8-bit bus transactions corresponding to the programmed transaction size. The data are packed or unpacked accordingly.
0x3: reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SIZE[2:0]**: size of next memory access transaction
0x0: 8 bits
0x1: 16 bits
0x2: 32 bits
0x3: 64 bits
Others: reserved

### AP1 control/status word register (AP1_CSW)

Address offset: 0x0

Reset value: 0x8000 0042

For a detailed description of each field, refer to the *Arm AMBA protocol specifications for the corresponding bus [10.,11.,12.]*.

AP1 (AHB-AP):

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 **DBGSWENABLE**: software access enable
Defines whether the system debug APB can be accessed by software. This bit is anded with the **dbgswenable** signal from the BSEC.
0: disable software access
1: enable software access if **dbgswenable** signal from BSEC is also high

Bits 30:12 Reserved, must be kept at reset value.

Bits 11:8 **MODE[3:0]**: barrier support enabled
Defines if memory barrier operation is supported.
0x0: not supported

Bit 7 **TRINPROG**: transfer in progress (read only)
Indicates if a bus transfer is in progress on the AP.
0x0: no transfer in progress
0x1: bus transfer in progress

Bit 6 **DEVICEEN**: device enabled (read only)
Defines whether the system debug APB can be accessed by the debugger. This bit reflects the state of the **deviceen** signal from the BSEC.
0x0: APB access disabled. Any attempt to initiate a transaction on the AP will return an error.
0x1: APB access enabled

Bits 5:4 **ADDRINC[1:0]**: auto-increment mode
Defines whether TAR address is automatically incremented after a transaction.
0x0: no auto-increment
0x1: address is incremented by the size in bytes of the transaction (SIZE field)
Others: reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SIZE[2:0]**: size of next memory transaction access (read only)
0x2: word (32 bits)

### AP2 control/status word register (AP2_CSW)

Address offset: 0x0

Reset value: 0x2300 0040

For a detailed description of each field, refer to the *Arm AMBA protocol specifications for the corresponding bus [10.,11.,12.]*.

AP2 (AHB-AP):

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **MASTERTYPE**: type of master (read only)
1: debug

Bits 28:26 Reserved, must be kept at reset value.

Bit 25 **HPROT1**: defines the HPROT(1) attribute of the transaction
0: user access
1: privileged access

Bits 24:12 Reserved, must be kept at reset value.

Bits 11:8 **MODE[3:0]**: mode of operation
0x0: Normal download or upload
0x1-0xF: Reserved

Bit 7 **TRINPROG**: transfer in progress (read only)
Indicates if a bus transfer is in progress on the AP.
0x0: no transfer in progress
0x1: bus transfer in progress

Bit 6 **DBGSTATUS**: status of the DBGEN authentication signal (read only)
This signal determines whether the AHB bus can be accessed.
0: AHB transactions are blocked
1: AHB transactions are allowed

Bits 5:4 **ADDRINC[1:0]**: auto-increment mode

Defines whether address is automatically incremented after a transaction. If increment is enabled, the address wraps at 4- Kbyte address boundaries.

Auto address incrementing and packed data transfers are not performed on access to banked data registers 0x10-0x1C. The value of these bits is ignored in these cases.

0x0: no auto-increment

0x1: address is incremented by the size in bytes of the transaction (SIZE field)

0x2: packed transfers enabled. A 32-bit AP access gives rise to 1 x 32-bit, 2 x 16-bit, or 4 x 8-bit bus transactions corresponding to the programmed transaction size. The data is packed or unpacked accordingly.

0x3: reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SIZE[2:0]**: size of next memory access transaction

0x0: byte (8 bits)

0x1: halfword (16 bits)

0x2: word (32 bits)

Others: reserved

### AP transfer address register (AP_TAR)

Address offset: 0x04

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ADDRESS[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ADDRESS[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ADDRESS[31:0]**: address of the current transfer (bits 31:0)

### AP data read/write register (AP_DRW)

Address offset: 0x0C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: read/write data for current transfer

In write mode, this is the write data value. In read mode, this is the read data value.
For 64-bit access (AXI-AP only), multiple accesses must be initiated to DRW to make a single AXI access.

Read: the first read of DRW in a sequence initiates a memory access. The first read returns the lower 32 bits of data. Subsequent read access returns the upper 32 bits of data. If a write to the CSW or TAR is initiated before the sequence completes, then the read access is terminated, and read data is no longer available.

Write: the first write to DRW specifies the least significant 32 bits of data to be written. Subsequent write access specifies the most significant 32 bits to be written. If a write to the CSW is initiated before the sequence completes, then the write access is not initiated on the AXI interface.

Combining partial reads and writes in a sequence terminates the earlier access. Also, the latest access is not recognized.
Any write access to the CSW register, TAR, or to any other register in the AP during a sequence terminates the ongoing access. Also, the current access is not recognized.
If a write sequence is terminated, then there is no write on the AXI interface.

### AP banked data register 0 (AP_BD0)

Address offset: 0x10

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: read/write data for current transfer

The transaction address is TAR[31:4] << 4 + 0x0.

### AP banked data register 1 (AP_BD1)

Address offset: 0x14

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: read/write data for current transfer

The transaction address is TAR[31:4] << 4 + 0x4.

### AP banked data register 2 (AP_BD2)

Address offset: 0x18

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: read/write data for current transfer
The transaction address is TAR[31:4] << 4 + 0x8.

### AP banked data register 3 (AP_BD3)

Address offset: 0x1C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: read/write data for current transfer
The transaction address is TAR[31:4] << 4 + 0xC.

### AP ACE barrier transaction register (AP_ACE)

Address offset: 0x20

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | | | | | | | | | | | | | rw | rw | rw |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:1 **BARTRAN[1:0]**: barrier transactions
0x0: barrier with normal access
0x1: memory barrier
0x2: reserved
0x3: synchronization barrier

Bit 0 **TRGBARTRAN**: enable barrier transaction
0: disable
1: enable

### AP configuration register (AP_CFG)

Address offset: 0xF4

Reset value: 0x0000 0002

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LD | Res. | LA |
| | | | | | | | | | | | | | r | | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LD**: large data
Indicates support for data items larger than 32 bits (AXI-AP only).
1: 64-bit data supported

Bit 1 Reserved, must be kept at reset value.

Bit 0 **LA**: long address
Indicates support for greater than 32-bit addressing.
0: 32 or fewer bits of address

### AP x base address register (APx_BASE) (x = 0 to 2)

Address offset: 0xF8

Reset value: Block 0: 0x0000 0002

Reset value: Block 1: 0xE008 0003

Reset value: Block 2: 0xE00F F003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| BASEADDR[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| r | r | r | r | | | | | | | | | | | r | r |

Bits 31:12 **BASEADDR[31:12]**: base address
Corresponds to bits 31 to 12 of the ROM table for the AP. The 12 LSBs are zeros since the ROM table must be aligned on a 4-Kbyte boundary.
AP0 (AXI system bus): N/A (no ROM table)
AP1 (system debug APB): 0xE0080
AP2 (Cortex®-M4): 0xE00FF

Bits 11:2 Reserved, must be kept at reset value.

Bit 1 **FORMAT**: base address register format
1: Arm® debug interface v5

Bit 0 **ENTRYPRESENT**: debug component presence
Indicates that debug components are present on the access port bus.
0: no debug components present
1: debug components are present

### AP x identification register (APx_IDR) (x = 0 to 2)

Address offset: 0xFC

Reset value: Block 0: 0x3477 0004

Reset value: Block 1: 0x4477 0003

Reset value: Block 2: 0x2477 0011

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 **REVISION[3:0]**: revision code
0x2: r0p3
0x3: r1p0
0x4: r0p5
0x6: r0p7

Bits 27:24 **JEDECBANK[3:0]**: JEDEC bank
0x4: Arm®

Bits 23:17 **JEDECCODE[6:0]**: JEDEC code
0x3B: Arm®

Bit 16 **MEMAP**: memory access port
0x1: standard register map

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **IDENTITY[7:0]**: AP type
0x04: AXI-AP
0x03: APB-AP
0x11: Cortex®-M4 AP

## 66.10 System debug features

The system debug features include the following CoreSight™ components:

- System ROM tables
- Global trace timestamp generator (TSGEN)
- System cross trigger interface (CTI)
- Cross trigger matrix (CTM)
- Trace port interface unit (TPIU)
- Trace bus funnel (CSTF)
- Embedded trace FIFO (ETF)
- Serial Wire Output (SWO)

These components are accessible by the debugger via the system APB-AP and its associated APB debug bus. They are also accessible by the Cortex®-A7 and Cortex®-M4 processors.

The MCU debug unit (DBG_MCU) is also accessed via the Debug APB. This non-CoreSight™ component contains registers for configuring the behavior of the device in debug mode.

### 66.10.1 System ROM tables

There are two ROM tables on the Debug APB bus. The ROM table is a CoreSight™ component that contains the base addresses of the CoreSight™ debug components on the APB bus. These tables allow a debugger to discover the topology of the CoreSight™ system automatically.

The first table points to the CoreSight™ components located in the debug subsystem: SWO, TSG, and the Cortex®-A7 debug components, as well as to the Trace subsystem ROM table on the debug APB. The DBG_MCU is not referenced by the table as it is not a standard CoreSight™ component. The table occupies a 4-Kbyte, 32-bit wide chunk of APB address space, from 0xE008 0000 to 0xE008 0FFC when accessed by the debugger, and 0x5008 0000 to 0x5008 0FFC when accessed from the system bus.

**Table 554. Debug subsystem ROM table**

| Address offset in ROM table | Component name | Component base address (debugger) | Component base address (system bus) | Component address offset | Size | Data |
|---|---|---|---|---|---|---|
| 0x000 | Reserved | 0xE008 1000 | 0x5008 1000 | 0x0 1000 | 4 Kbyte | 0x0000 1002 |
| 0x004 | Timestamp generator | 0xE008 2000 | 0x5008 2000 | 0x0 2000 | 4 Kbyte | 0x0000 2003 |

| 0x038 to 0xFC8 | Reserved | - | - | - | - | 0x0000 0000 |
| 0xFCC to 0xFFC | ROM table registers | - | - | - | - | See *Table 556* |

The second table occupies a 4-Kbyte, 32-bit wide chunk of APB address space, from 0xE009 0000 to 0xE009 0FFC when accessed by the debugger, and 0x5009 0000 to 0x5009 0FFC when accessed from the system bus. It points to the CoreSight™ components located in the trace subsystem.

**Table 555. Trace subsystem ROM table**

| Address offset in ROM table | Component name | Component base address (debugger) | Component base address (system bus) | Component address offset | Size | Entry |
|---|---|---|---|---|---|---|
| 0x000 | Trace funnel | 0xE009 1000 | 0x5009 1000 | 0x1000 | 4 Kbyte | 0x0000 1003 |
| 0x004 | ETF | 0xE009 2000 | 0x5009 2000 | 0x2000 | 4 Kbyte | 0x0000 2003 |
| 0x008 | TPIU | 0xE009 3000 | 0x5009 3000 | 0x3000 | 4 Kbyte | 0x0000 3003 |
| 0x00C | Trace CTI | 0xE009 4000 | 0x5009 4000 | 0x4000 | 4 Kbyte | 0x0000 4003 |
| 0x010 | Top of table | - | - | - | - | 0x0000 0000 |
| 0x018 to 0xFC8 | Reserved | - | - | - | - | 0x0000 0000 |
| 0xFCC to 0xFFC | ROM table registers | - | - | - | - | See *Table 556* |

The top of each ROM table contains a number of read only registers, including the standard CoreSight™ component and peripheral identity registers, refer to *Table 556*.

Each debug component occupies one or more 4-Kbyte blocks of address space. This block of address space is referred to as the Debug Register File for the component.

The component address offset field of a ROM Table entry points to the start of the last 4-Kbyte block of the address space of the component. This block always contains the Component and Peripheral ID Registers for the component, starting at offset 0xFD0 from the start of the block. The 4-Kbyte count field, bits PIDR4[7:4], specifies the number of 4-Kbyte blocks for the component. Therefore, the process for finding the start of the address space for a component is:

1. Read the ROM Table entry for the component, and extract the Address offset for the component. The Address offset is bits [31:12] of the ROM Table entry.
2. Use the Address offset, together with the base address of the ROM Table, to calculate the base address of the component. The component base address is:

   Component_Base_Address = ROM_Base_Address + (Address_Offset << 12)

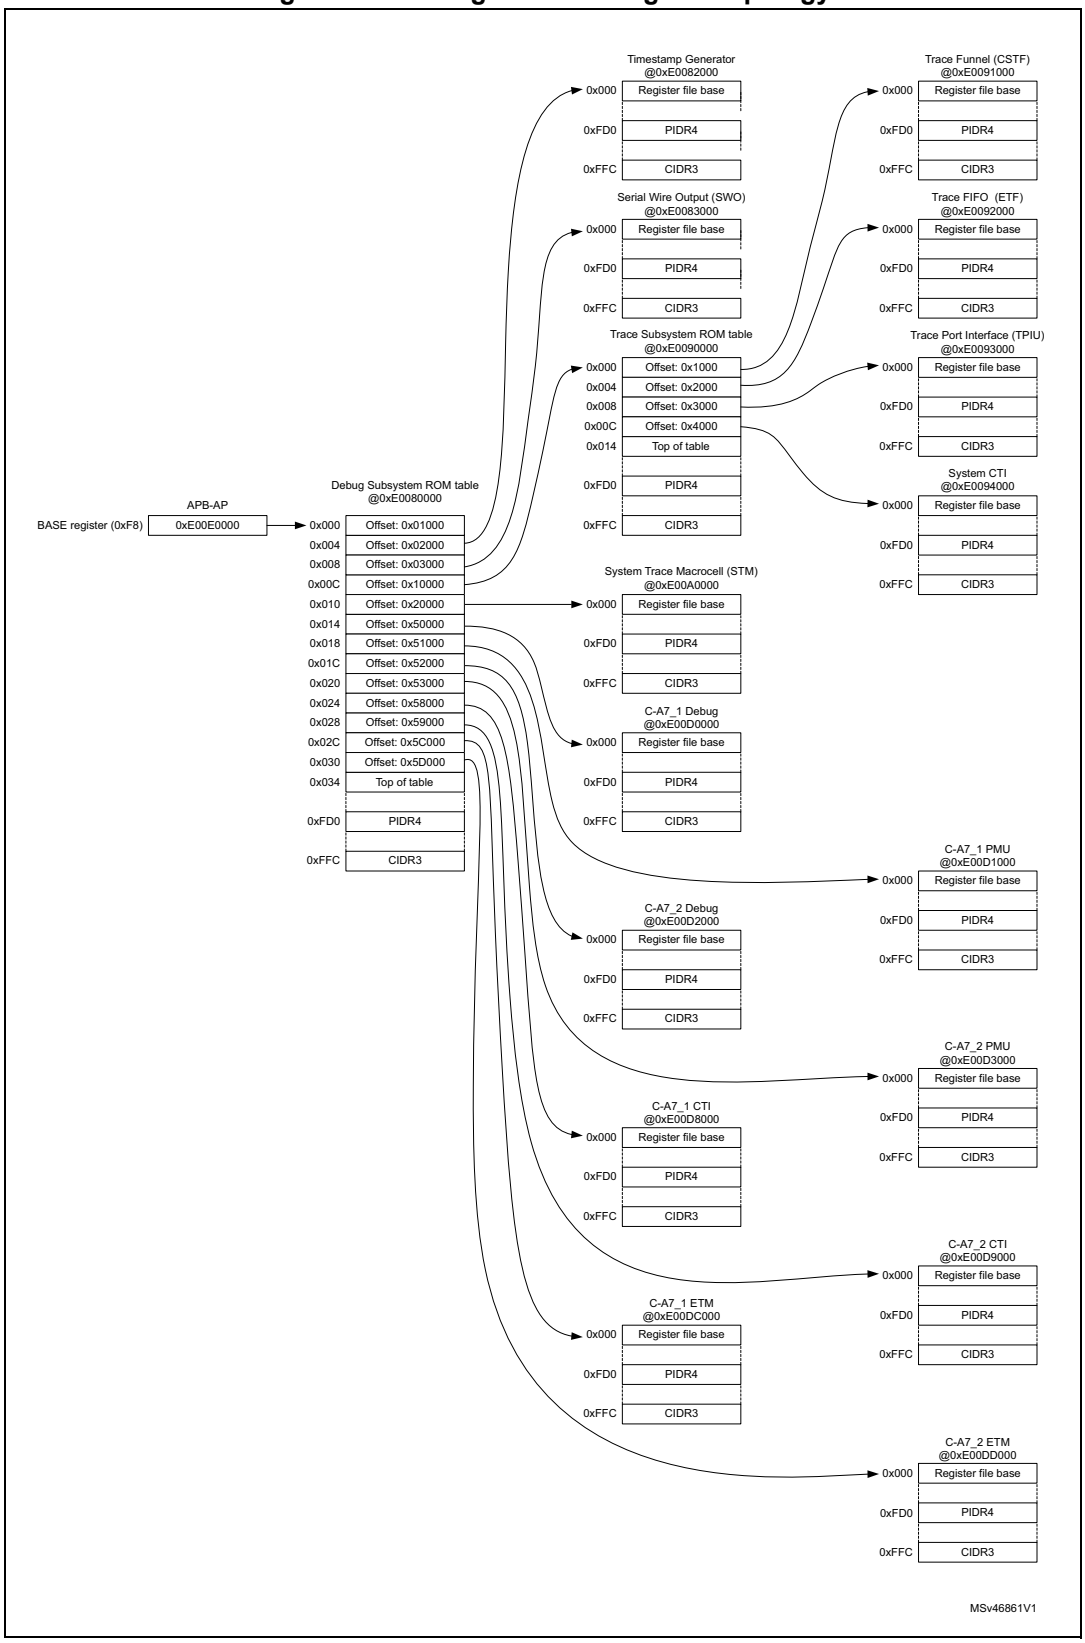
   Component_Base_Address is the start address of the final 4-Kbyte block of the address space for the component.
3. Read the Peripheral ID4 Register for the component. The address of this register is:

   Peripheral_ID4_address = Component_Base_Address + 0xFD0
4. Extract the 4-Kbyte count field, bits [7:4], from the value of the Peripheral ID4 Register.
5. Use the 4-Kbyte count value to calculate the start address of the address space for the component. If the 4-Kbyte count field is 0000, indicating a count value of 1, the address space for the component starts at the Component_Base_Address obtained at stage 2.

The topology for the CoreSight™ components on the debug APB is shown in *Figure 817*.

For more information on the use of the ROM table, refer to the *Arm® Debug Interface Architecture Specification [1]*.

**Figure 817. Debug APB CoreSight™ topology**



## ROM registers

### SYSROM memory type register (SYSROM_MEMTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0000

### 66.10.2 CoreSight™ global timestamp generator (TSGEN)

The CoreSight™ Global Timestamp Generator contains a 64-bit counter that provides a common timing reference for all of the trace sources in the system, namely the ETM, ITM and STM. These components insert timestamps in the trace streams that allow the trace analyser to recover the chronological order of trace packets, which can be lost when multiple trace sources are multiplexed into one stream at the funnels.

The TSG registers are accessible over the Debug APB. This allows the debugger or debug software to:

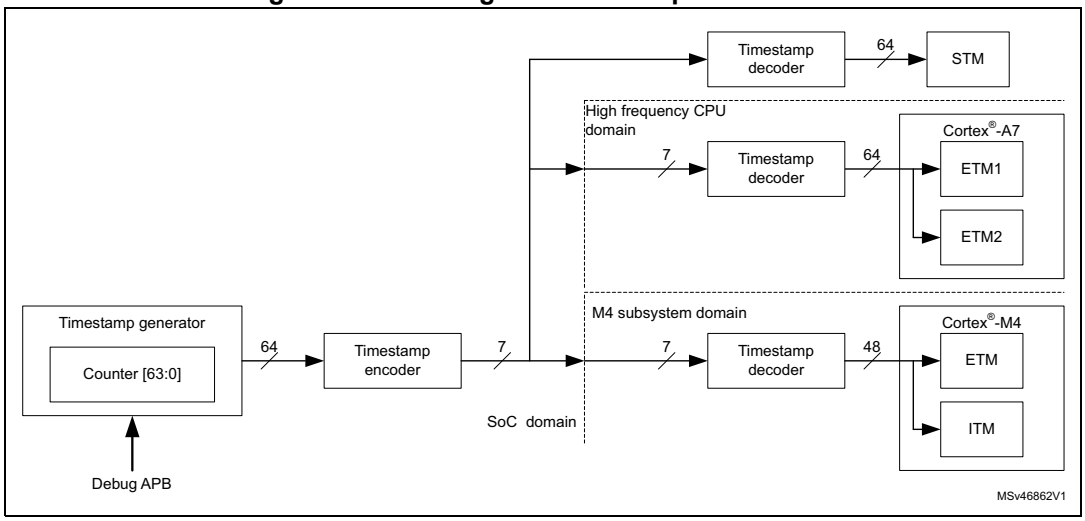
- Start and stop the timestamp incrementing.
- Cause the timestamp counter to stop when debug state is entered. To enable this feature, the trace subsystem CTI must be configured to signal to the timestamp generator when system-wide debug state has been entered (meaning that all CPU cores are halted).
- Read the current timestamp value.
- Change the current timestamp value. The timestamp counter must be halted while it is changed. When the timestamp value is changed, the timestamp generator resynchronizes all the trace sources.
- Change the reported timestamp increment.

For more information on the CoreSight™ Timestamp Generator CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual [2]*.

The timestamp generator is located in the ck_apb_dbg domain, and the timestamp is distributed to the Cortex®-A7 and Cortex®-M4. To simplify the distribution over clock domain boundaries, the 64-bit timestamp is encoded in 7 bits, then decoded in the destination power domain. The timestamp distribution is shown in *Figure 818*.

Whenever the frequency of the TSGEN, Cortex®-A7 or Cortex®-M4 changes, the ETM of the respective processor receives a pulse on the TSCLKCHANGE input.

**Figure 818. CoreSight™ timestamp distribution**



### Timestamp generator registers

### TSG counter control register (TSG_CNTCR)

Address offset: 0x000

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | rw | rw |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **HDBG**: halt on debug
0: normal operation
1: halts counter when system-wide debug state is detected (via CTI)

Bit 0 **EN**: enable
0: counter disabled
1: counter enabled and incrementing

### TSG counter status register (TSG_CNTSR)

Address offset: 0x004

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | | | | | r | |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DBGH**: debug halted
0: normal operation
1: counter halted due to system-wide debug state

Bit 0 Reserved, must be kept at reset value.

### TSG current counter value lower register (TSG_CNTCVL)

Address offset: 0x008

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CNTCVU_L_32[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CNTCVU_L_32[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **CNTCVU_L_32[31:0]**: timestamp counter current value (least significant 32 bits)

To change the current timestamp value, write the least significant 32 bits of the new value to this register before writing the most significant 32 bits to TSG_CNTCVU. The timestamp value is not changed until the TSG_CNTCVU register is written to.

*Note: Bit EN of register TSG_CNTCR must be cleared before writing to register TSG_CNTCVL.*

### TSG current counter value upper register (TSG_CNTCVU)

Address offset: 0x00C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CNTCVU_U_32[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CNTCVU_U_32[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **CNTCVU_U_32[31:0]**: timestamp counter current value (most significant 32 bits)

To change the current timestamp value, write the least significant 32 bits of the new value to TSG_CNTCVL before writing the most significant 32 bits to this register. The 64-bit timestamp value is updated with the value from both writes when this register is written to.

*Note: Bit EN of register TSG_CNTCR must be cleared before writing to register TSG_CNTCVU.*

### TSG base frequency ID register (TSG_CNTFID0)

Address offset: 0x020

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FREQ[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| FREQ[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **FREQ[31:0]**: increment frequency of TSG counter in Hz

This field must be programmed with the trace generator clock frequency whenever it changes.

### TSG CoreSight peripheral identity register 4 (TSG_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

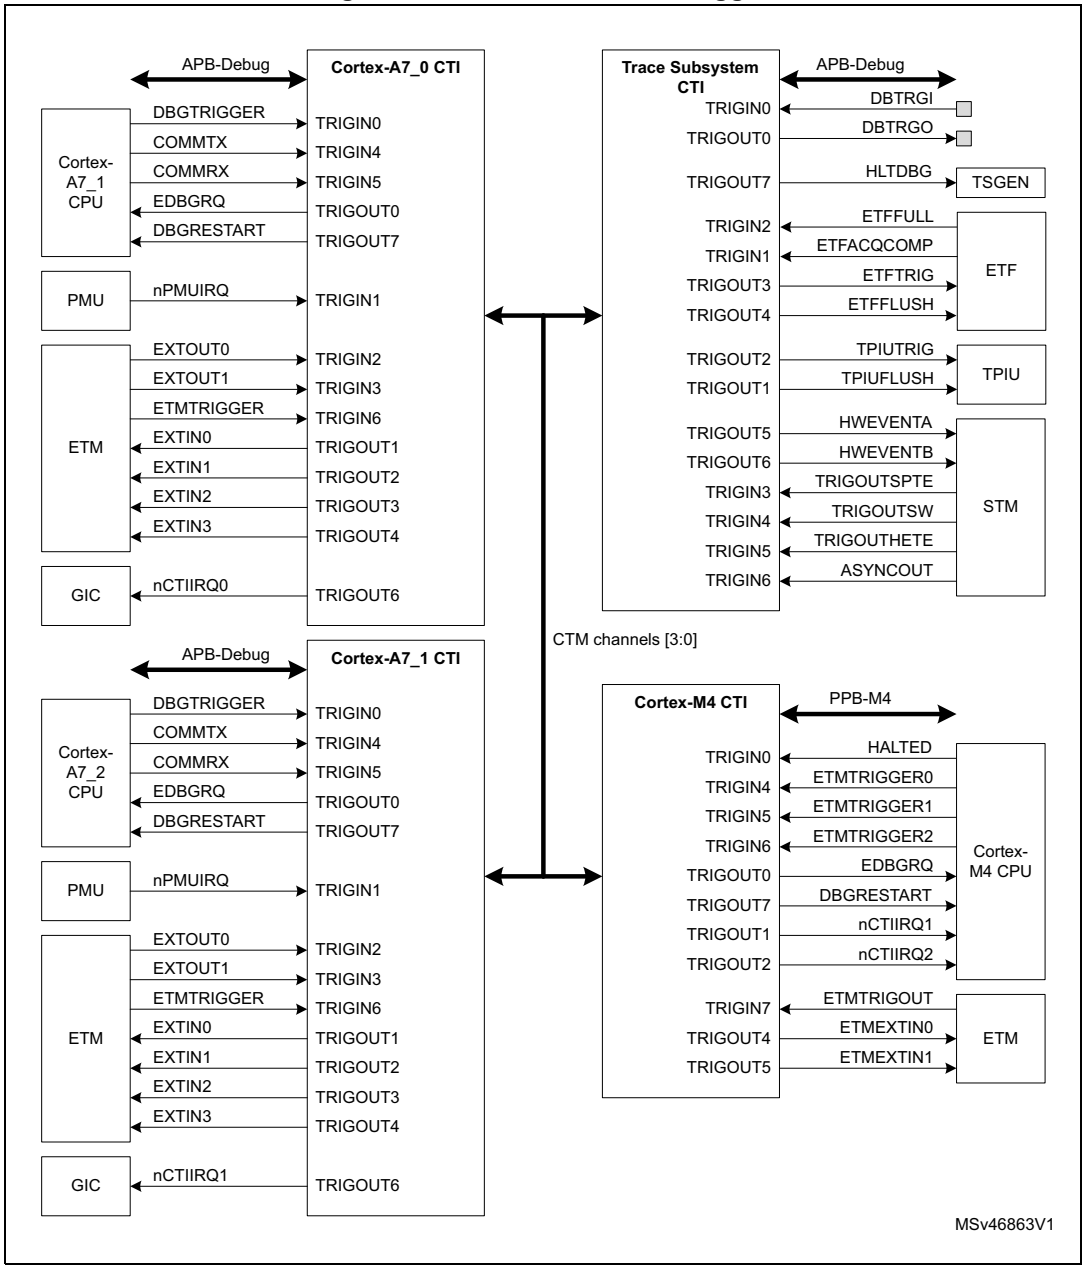
## 66.10.3 Cross trigger interface (CTI) and matrix (CTM)

The cross trigger interface (CTI) and cross trigger matrix (CTM) together form the CoreSight™ embedded cross trigger feature. There are four CTI components, one in the trace subsystem, one for each Cortex®-A7, and one dedicated to the Cortex®-M4. The CTIs are connected to each other via the CTM. The trace subsystem CTI and the Cortex®-A7

CTIs are accessible to the debugger via the debug APB. The Cortex®-M4 CTI is accessible on its private peripheral bus (PPB) via the Cortex®-M4 AHB access port.

**Figure 819. Embedded cross trigger**



The CTIs allow events from various sources to trigger debug and/or trace activity. For example, a breakpoint reached in one of the processor cores can stop the other processor, or a transition detected on an external trigger input can start code trace.

Each CTI has up to 8 trigger inputs and 8 trigger outputs. Any input can be connected to any output, on the same CTI, or on another CTI via the CTM.

The trigger input and output signals for each CTI are listed in *Table 558* to *Table 563*.

**Table 558. Trace Subsystem CTI inputs**

| | Source signal | Source component | Comments |
|---|---|---|---|
| 0 | DBTRIGI | GPIO | External trigger input - allows an external signal to generate a debug event |
| 1 | ETFACQCOMP | ETF | ETF capture finished - allows a debug event to be generated when the trace FIFO is empty |
| 2 | ETFFULL | ETF | ETF full flag - allows a debug event to be generated when the trace FIFO is full |
| 3 | TRIGOUTSPTE | STM | The STM asserts this signal for one clock cycle when a trigger event is detected on a match using the STMSPTER. |
| 4 | TRIGOUTSW | STM | The STM asserts this signal for one clock cycle when a trigger event is generated on writes to a TRIG location in the extended stimulus port registers. |
| 5 | TRIGOUTHETE | STM | The STM asserts this signal for one clock cycle when a trigger event is detected on a match using the STMHETER. |
| 6 | ASYNCOUT | STM | Alignment synchronization signal. The STM asserts this signal for one clock cycle when an ASYNC-VERSION-FREQ sequence is output on the ATB interface, and the ASYNCOUT signal can be used for cross-triggering. |
| 7 | - | - | Not used |

**Table 559. Trace Subsystem CTI outputs**

| | Output signal | Destination component | Comments |
|---|---|---|---|
| 0 | DBTRIGO | GPIO | External IO trigger output - allows monitoring of events on the external DBTRIGO pin |
| 1 | TPIUFLUSH | TPIU | Trace port flush trigger - causes the TPIU FIFO to be flushed |
| 2 | TPIUTRIG | TPIU | Trace Port enable trigger - starts trace output on the external trace port |
| 3 | ETFTRIG | ETF | ETF enable trigger - starts filling the Trace FIFO |
| 4 | ETFFLUSH | ETF | ETF flush trigger - causes the Trace FIFO to be flushed |
| 5 | HWEVENTA | STM | STM hardware event |
| 6 | HWEVENTB | STM | STM hardware event |
| 7 | HLTDBG | TSGEN | Halts timestamp in debug - freezes the TSGEN timestamp counter |

**Table 560. Cortex®-A7_1/2 CTI inputs**

| | Source signal | Source component | Comments |
|---|---|---|---|
| 0 | DBGTRIGGER | Cortex®-A7 CPU | Pulsed high when the core enters in debug state |
| 1 | nPMUIRQ | PMU | Performance monitor interrupt |
| 2 | EXTOUT0 | ETM | ETM external trigger output |
| 3 | EXTOUT1 | ETM | ETM external trigger output |
| 4 | COMMTX | Cortex®-A7 CPU | Debug comm port transmit |
| 5 | COMMRX | Cortex®-A7 CPU | Debug comm port receive |
| 6 | ETMTRIGGER | ETM | ETM trigger |
| 7 | - | - | Not used |

**Table 561. Cortex®-A7_1/2 CTI outputs**

| | Output signal | Destination component | Comments |
|---|---|---|---|
| 0 | EDBGRQ | Cortex®-A7 CPU | CPU halt request - puts CPU in debug mode |
| 1 | EXTIN0 | ETM | ETM external input |
| 2 | EXTIN1 | ETM | ETM external input |
| 3 | EXTIN2 | ETM | ETM external input |
| 4 | EXTIN3 | ETM | ETM external input |
| 5 | - | - | Not used |
| 6 | nCTIIRQ | GIC | CTI interrupt |
| 7 | DBGRESTART | Cortex®-A7 CPU | CPU restart request - CPU exits debug mode |

**Table 562. Cortex®-M4 CTI inputs**

| | Source signal | Source component | Comments |
|---|---|---|---|
| 0 | HALTED | M4 CPU | CPU halted - indicates CPU is in debug mode |
| 1 | - | - | Not used |
| 2 | - | - | Not used |
| 3 | - | - | Not used |
| 4 | ETMTRIGGER0 | M4 DWT | Trace trigger - enables CPU execution trace |
| 5 | ETMTRIGGER1 | M4 DWT | Trace trigger - enables CPU execution trace |
| 6 | ETMTRIGGER2 | M4 DWT | Trace trigger - enables CPU execution trace |
| 7 | ETMTRIGOUT | M4 ETM | ETM triggered - indicates trace active |

**Table 563. Cortex®-M4 CTI outputs**

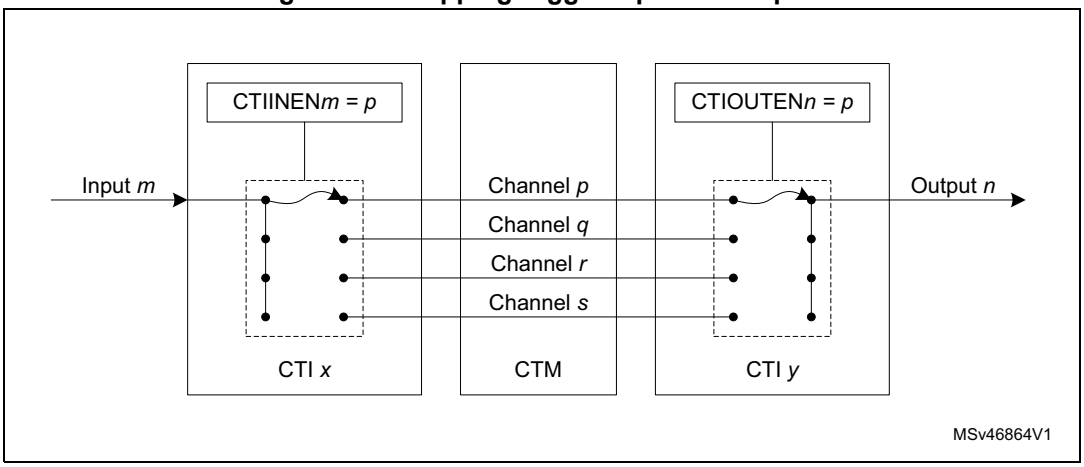
| | Source signal | Destination component | Comments |
|---|---|---|---|
| 0 | EDBGRQ | M4 CPU | CPU halt request -puts CPU in debug mode |
| 1 | nIRQ1 | M4 NVIC | CTI interrupt |
| 2 | nIRQ2 | M4 NVIC | CTI interrupt |
| 3 | - | - | Not used |
| 4 | ETMEXTIN0 | M4 ETM | ETM external input |
| 5 | ETMEXTIN1 | M4 ETM | ETM external input |
| 6 | - | - | Not used |
| 7 | DBGRESTART | M4 ETM | CPU restart request - CPU exits debug mode |

There are four event channels in the cross trigger matrix, which allows up to four, parallel, bidirectional connections between trigger inputs and outputs on different CTIs. To connect input number *m* on CTI *x* to output number *n* on CTI *y*, the input must be connected to an event channel *p* using the CTI_INEN*m* register of CTI *x*. The same channel *p* must be connected to the output using the CTI_OUTEN*n* register of CTI *y*.

*Note: The above connection settings are also valid if the input and output belong to the same CTI.*

An input can be connected to more than one channel (up to four). As a result, an input can be routed to several outputs. Similarly, an output can be connected to several inputs. It is also possible to connect several inputs/outputs to the same channel.

**Figure 820. Mapping trigger inputs to outputs**



Example configuration:

When either the MCU or the MPU hits a breakpoint, stop the other processor. Restart the two processors synchronously.

To stop both cores when either core stops requires the debug status output of each core (that is HALTED for the Cortex®-M4, DBGTRIGGER for the Cortex®-A7) to be connected to the EDBGRQ input of the opposite core.

Referring to *Table 560* and *Table 562*, we see that the DBGTRIGGER signal from the Cortex®-A7_1 core is connected to input 0 of the Cortex®-A7_1 CTI, and the HALTED signal from the Cortex®-M4 core is connected to the same input on the Cortex®-M4

CTI. Hence we program the CTI_IEN0 register on each CTI to connect these inputs to a CTM channel (eg. channel 0).

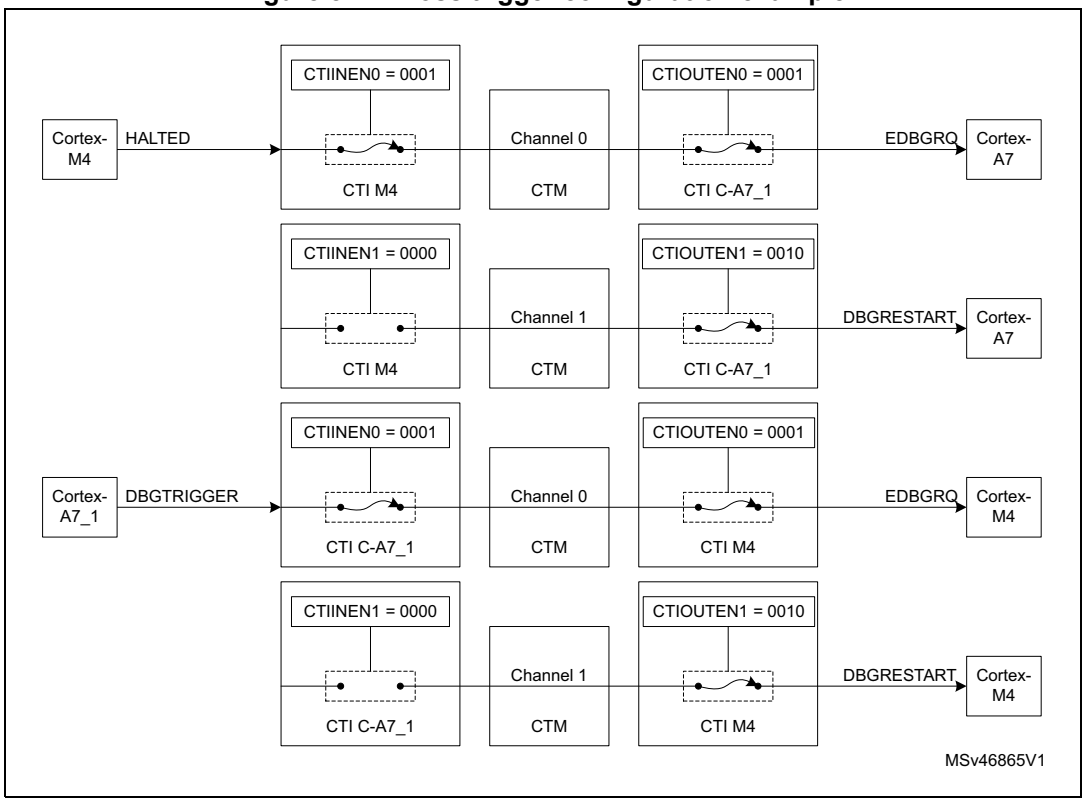
From *Table 561* and *Table 563* we see that the EDBGRQ signals to the CPUs are connected to output 0 of the respective CTIs. So we program the CTI_OUTEN0 register on each CTI to connect these outputs to the same CTM channel.

To restart both cores simultaneously the debugger must use the CTI_APPPULSE register in either of the CTIs. This allows the debugger to generate a pulse on any of the four ETM channels. The channel must be connected to the DBGRESTART signal of both cores.

From *Table 561* and *Table 563* we see that the DBGRESTART signals to the CPUs are connected to output 1 of the respective CTIs. So we program the CTI_OUTEN1 register on each CTI to connect these outputs to an unused CTM channel (eg. channel 1).

The above configuration is illustrated in *Figure 821*.

**Figure 821. Cross trigger configuration example**



To force the processors to restart simultaneously, the debugger should use the following procedure:

1. Clear the debug request by writing 0x01, then 0x00, to the CTI_INTACK register in each CTI.
2. Cause a pulse on channel 1 by writing 0x02 to the CTI_APPPULSE register in either CTI. This will generate a restart request to both processors.

   Note that the debugger can also force both cores to stop simultaneously by writing 0x01 to the CTI_APPPULSE register in either CTI, which generates a pulse on channel 0.

For more information on the cross trigger interface CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual* [2].

### Cross trigger interface registers

The register file base address for each CTI is defined by the ROM table for the bus to which it is connected. The registers are the same for each CTI.

### CTI control register (CTI_CONTROL)

Address offset: 0x000

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPSET[3:0]**: channel event set

Read:
XXX0: channel 0 event inactive
XXX1: channel 0 event active
XX0X: channel 1 event inactive
XX1X: channel 1 event active
X0XX: channel 2 event inactive
X1XX: channel 2 event active
0XXX: channel 3 event inactive
1XXX: channel 3 event active
Write:
XXX0: no effect
XXX1: sets event on channel 0
XX0X: no effect
XX1X: sets event on channel 1
X0XX: no effect
X1XX: sets event on channel 2
0XXX: no effect
1XXX: sets event on channel 3

### CTI application trigger clear register (CTI_APPCLEAR)

Address offset: 0x018

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGINEN[3:0]**: cross-trigger event enable / disable

Enables or disables a cross-trigger event on each of the four channels when CTITRIGINn is activated (n = 0 to 7).
XXX0: trigger n does not generate events on channel 0
XXX1: trigger n generates events on channel 0
XX0X: trigger n does not generate events on channel 1
XX1X: trigger n generates events on channel 1
X0XX: trigger n does not generate events on channel 2
X1XX: trigger n generates events on channel 2
0XXX: trigger n does not generate events on channel 3
1XXX: trigger n generates events on channel 3

### CTI Trigger out enable x registers (CTI_OUTENx)

Address offset: 0x0A0 + 0x04 * x, (x = 0 to 7)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIGOUTEN[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGOUTEN[3:0]**: output trigger enable / disable

For each channel, defines whether an event on that channel generates a trigger on CTITRIGOUTn (n = 0 to 7).
XXX0: channel 0 events does not generate triggers on trigger output n
XXX1: channel 0 events generates triggers on trigger output n
XX0X: channel 1 events does not generate triggers on trigger output n
XX1X: channel 1 events generates triggers on trigger output n
X0XX: channel 2 events does not generate triggers on trigger output n
X1XX: channel 2 events generates triggers on trigger output n
0XXX: channel 3 events does not generate triggers on trigger output n
1XXX: channel 3 events generates triggers on trigger output n

### CTI trigger in status register (CTI_TRGISTS)

Address offset: 0x130

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHINSTATUS[3:0]**: channel input status

There is one bit of the register for each channel input. When a bit is set to 1, it indicates that the corresponding channel input is active. When it is set to 0, the corresponding channel input is inactive.

### CTI channel out status register (CTI_CHOUTSTS)

Address offset: 0x13C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CHOUTSTATUS[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHOUTSTATUS[3:0]**: channel output status

There is one bit of the register for each channel output. When a bit is set to 1, it indicates that the corresponding channel output is active. When it is set to 0, the corresponding channel output is inactive.

### CTI channel gate register (CTI_GATE)

Address offset: 0x140

Reset value: 0x0000 000F

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | GATEEN[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **GATEEN[3:0]**: channel output enable

For each channel, defines whether an event on that channel can propagate over the CTM to other CTIs.
XXX0: channel 0 events do not propagate
XXX1: channel 0 events propagate
XX0X: channel 1 events do not propagate
XX1X: channel 1 events propagate
X0XX: channel 2 events do not propagate
X1XX: channel 2 events propagate
0XXX: channel 3 events do not propagate
1XXX: channel 3 events propagate

### CTI claim tag set register (CTI_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates there are four bits in claim tag

### CTI claim tag clear register (CTI_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

### CTI lock access register (CTI_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: CTI register write access enable
Enables write access to some CTI registers by processor cores (debuggers do not need to unlock the component).
0xC5ACCE55: enable write access
Other values: disable write access

### CTI lock status register (CTI_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: CTI_LAR register size
Indicates the size of the CTI_LAR register.
0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
This bit always reads as zero by an external debugger.
0: write access is permitted
1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
0: no lock control mechanism exists
1: lock control mechanism is implemented

### CTI authentication status register (CTI_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
0x2: disabled
0x3: enabled

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
0x2: disabled
0x3: enabled

### CTI device configuration register (CTI_DEVID)

Address offset: 0xFC8

Reset value: 0x0004 0800

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | NUMCH[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMTRIG[7:0] | | | | | | | | Res. | Res. | Res. | EXTMUXNUM[4:0] | | | | |
| r | r | r | r | r | r | r | r | | | | r | r | r | r | r |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **NUMCH[3:0]**: number of ECT channels available
0x4: 4 channels

Bits 15:8 **NUMTRIG[7:0]**: number of ECT triggers available
0x8: 8 trigger inputs and 8 trigger outputs

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **EXTMUXNUM[4:0]**: number of trigger input/output multiplexers
0x0: none

### CTI device type Identifier register (CTI_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0014

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SUBTYPE[3:0] | | | | MAJORTYPE[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: sub-classification

0x1: indicates that this component is a cross-triggering component

Bits 3:0 **MAJORTYPE[3:0]**: major classification

0x4: indicates that this component allows a debugger to control other components in a CoreSight™ SoC-400 system

### CTI CoreSight peripheral identity register 4 (CTI_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SIZE[3:0] | | | | JEP106CON[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size

0x0: register file occupies a single 4-Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

### CTI CoreSight peripheral identity register 0 (CTI_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0006

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.10.4 Trace funnel (CSTF)

The trace funnel is a CoreSight™ component that combines the ATB buses from the five trace sources into one single ATB. The CSTF has five ATB slave ports, and one ATB master port. An arbiter selects the slave ports according to a programmable priority.

The slave ports are connected as follows:

- S0: STM
- S1: Cortex®-A7_1 ETM
- S2: Cortex®-A7_2 ETM
- S3: Cortex®-M4 ETM
- S4: Cortex®-M4 ITM

The CSTF registers allow the slave ports to be individually enabled, and their priority settings to be configured. The priorities can be modified only when trace is disabled. The arbitration works as follows:

– The arbiter selects the slave port with the highest assigned priority that has data valid
– Up to *min_hold_time* transfers are passed from the selected slave to the master port, where *min_hold_time* is programmable in the CONTROL register.
– A new arbitration is then performed

High priority should be assigned to slave ports connected to sources with a small amount of buffering, or where data loss can not be tolerated. Low priority should be assigned to less critical sources or those with large buffers.

For more information on the ATB Funnel CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual* [2].

### Trace funnel registers

### CSTF control register (CSTF_CTRL)

Address offset: 0x000

Reset value: 0x0000 0300

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | MIN_HOLD_TIME[3:0] | | | | Res. | Res. | Res. | ENS4 | ENS3 | ENS2 | ENS1 | ENS0 |
| | | | | rw | rw | rw | rw | | | | rw | rw | rw | rw | rw |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **MIN_HOLD_TIME[3:0]**: number of transactions between each arbitration
0x0: 1 transaction
:
0xE: 15 transactions
0xF: reserved

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **ENS4**: slave port S4 enable
0: disables port
1: enables port

Bit 3 **ENS3**: slave port S3 enable
0: disables port
1: enables port

Bit 2 **ENS2**: slave port S2 enable
0: disables port
1: enables port

Bit 1 **ENS1**: slave port S1 enable
0: disables port
1: enables port

Bit 0 **ENS0**: slave port S0 enable
0: disables port
1: enables port

### CSTF priority register (CSTF_PRIORITY)

Address offset: 0x004

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | PRIPORT4[2:0] | | | PRIPORT3[2:0] | | | PRIPORT2[2:0] | | | PRIPORT1[2:0] | | | PRIPORT0[2:0] | | |
| | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:12 **PRIPORT4[2:0]**: slave port S4 priority
0: highest priority
:
7: lowest priority

Bits 11:9 **PRIPORT3[2:0]**: slave port S3 priority
0: highest priority
:
7: lowest priority

Bits 8:6 **PRIPORT2[2:0]**: slave port S2 priority
0: highest priority
:
7: lowest priority

Bits 5:3 **PRIPORT1[2:0]**: slave port S1 priority
0: highest priority
:
7: lowest priority

Bits 2:0 **PRIPORT0[2:0]**: slave port S0 priority
0: highest priority
:
7: lowest priority

### CSTF claim tag set register (CSTF_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates that there are four bits in claim tag

### CSTF claim tag clear register (CSTF_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

### CSTF lock access register (CSTF_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: CTI register write access enable

Enables write access to some CTI registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: enable write access

Other values: disable write access

### CSTF lock status register (CSTF_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE:** CSTF_LAR register size

Indicates the size of the CSTF_LAR register.

0: 32-bit

Bit 1 **LOCKGRANT:** current lock status

This bit always reads as zero by an external debugger.

0: write access is permitted

1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST:** lock control existence

Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.

0: no lock control mechanism exists

1: lock control mechanism is implemented

### CSTF authentication status register (CSTF_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
0x0: not implemented

### CSTF CoreSight device identity register (CSTF_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0024

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SCHEME[3:0] | | | | PORTCNT[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SCHEME[3:0]**: priority scheme
0x2: static priority

Bits 3:0 **PORTCNT[3:0]**: number of input ports connected
0x4: four input ports

### CSTF CoreSight device identity register (CSTF_TYPEID)

Address offset: 0xFCC

Reset value: 0x0000 0012

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DEVTYPEID[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **DEVTYPEID[7:0]**: device type identifier
0x12: trace funnel

### CSTF CoreSight peripheral identity register 0 (CSTF_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0008

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PARTNUM[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PARTNUM[7:0]**: part number bits [7:0]
0x08: CSTF part number

### CSTF CoreSight peripheral identity register 1 (CSTF_PIDR1)

Address offset: 0xFE4

Reset value: 0x0000 00B9

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | JEP106ID[3:0] | | | | PARTNUM[11:8] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **JEP106ID[3:0]**: JEP106 identity code bits [3:0]
0xB: Arm® JEDEC code

Bits 3:0 **PARTNUM[11:8]**: Part number bits [11:8]
0x9: CSTF part number

### CSTF CoreSight peripheral identity register 2 (CSTF_PIDR2)

Address offset: 0xFE8

Reset value: 0x0000 001B

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | REVISION[3:0] | | | | JEDEC | JEP106ID[6:4] | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVISION[3:0]**: component revision number
0x1: r0p1

Bit 3 **JEDEC:** JEDEC assigned value
0x1: designer ID specified by JEDEC

Bits 2:0 **JEP106ID[6:4]**: JEP106 identity code bits [6:4]
0x3: Arm® JEDEC code

### CSTF CoreSight peripheral identity register 3 (CSTF_PIDR3)

Address offset: 0xFEC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.10.5 Embedded trace FIFO (ETF)

The ETF is an 8-kbyte memory which captures trace data from five trace sources, namely the ETM of each CPU core, the ITM of the Cortex®-M4, and the STM. The ETF is a configuration of the CoreSight™ Trace Memory Controller component.

The ETF can be used in three modes (selected in the Mode register):

1. Hardware FIFO mode

   The trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the Trace RAM and when full, the incoming trace stream is stalled. When the Trace buffer is not empty, trace data is drained out through the ATB master interface to the TPIU.

   In this mode, the role of the FIFO is to smooth the flow of trace information arriving at the trace port. Since the trace data can be very bursty in nature, the peak data rate can

easily exceed the port capability, resulting in an overflow. The ETF allows a steady data rate at the trace port, which can then be sized according to the average rate rather than the peak. The trace is stored off-chip in real time by the trace port analyser tool, and so the trace log can be very big.

2. Software FIFO mode

   The trace memory is used as a FIFO that can be read through the RRD Register while trace is being captured. Trace data is captured into the Trace RAM and when full, the incoming trace stream is stalled.

   This mode allows the trace to be transferred by DMA into the system memory, or to a high speed interface (SPI, USB etc), or even monitored by software running on one of the cores. Note that unlike the hardware FIFO mode, this mode is invasive, since it uses system resources which are shared by the processors.

3. Circular buffer mode

   The trace memory is used as a circular buffer. Trace data is captured into the Trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition occurs.

   In this mode, the ETF stores the trace data on-chip, so the trace log size is limited to that of the ETF SRAM, 8 kbytes in this case. Being a circular buffer, if the FIFO becomes full, incoming trace data will overwrite the oldest stored data, which will be lost. Therefore the contents of the trace buffer represent the most recent activity of the processor(s), up to the point when the buffer was stopped, rather than all the activity since the trace was started.

   There are three possible methods to read out the buffer contents once the trace has stopped:

   – via the Trace Port - with the TPIU enabled, the contents of the buffer are output over the trace port. This can be done by setting the DrainBuffer bit in the ETF_FFCR register.
   – via the Debug Port - the debugger can read the buffer via the RRD register which is accessible over the debug APB.
   – by software - either processor can read the buffer via the RRD register, since the debug APB is accessible from the system bus. This could also be performed by software triggered DMA transfers. No hardware DMA request is available so the FULL flag can be used to trigger an interrupt to the appropriate core via the cross trigger. The software can then read the ETF_CBUFLVL register to find out the number of data to be read.

For more information on the Trace Memory Controller CoreSight™ component, refer to the *Arm® CoreSight™ Trace Memory Controller Technical Reference Manual [3]*.

### Embedded trace FIFO registers

### ETF RAM size register (ETF_RSZ)

Address offset: 0x004

Reset value: 0x0000 0800

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **RSZ[30:0]**: size of the RAM in 32-bit words
0x800: 8 Kbytes

### ETF status register (ETF_STS)

Address offset: 0x00C

Reset value: 0x0000 001C

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EMPTY | FTEMPTY | READY | TRIGD | FULL |
| | | | | | | | | | | | r | r | r | r | r |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EMPTY:** trace FIFO empty
This bit is valid only when the TCEN bit of the ETF_CTL register is high. This bit reads as zero when TCEN is low.
0: trace FIFO contains data
1: trace FIFO is empty
*Note: EMPTY does not inform about ETF pipeline emptiness which is indicated by FTEMPTY.*

Bit 3 **FTEMPTY**: formatter empty
This bit is set when trace capture has stopped, and all internal pipelines and buffers have drained. Unlike READY, it is not affected by buffer drains. The ACQCOMP output reflects the value of this bit.

Bit 2 **READY**: ETF ready

This bit is set when trace capture has stopped and all internal pipelines and buffers have drained (STOPPED or DISABLED mode)

Bit 1 **TRIGD**: triggered

Bit triggered is set when trace capture is in progress and the TMC has detected a trigger event. This bit is cleared when leaving disabled state.

This bit is operational only in the circular buffer mode. In all other modes, this bit is always low.

This bit does not indicate that a trigger has been embedded in the formatted output trace data from the TMC. Trigger indication on the output trace stream is determined by the programming of the Formatter and Flush Control Register, ETF_FFCR.

Bit 0 **FULL**: trace buffer full

In circular buffer mode, this flag is set when the RAM write pointer wraps around the top of the buffer, and remains set until the TCEN bit of the ETF_CTL register is cleared and set.

In software and hardware FIFO modes, this flag indicates that the current space in the trace memory is less than or equal to the value programmed in the ETF_BUFWM register, that is, Fill level >= MEM_SIZE - BUFWM.

This bit is cleared when leaving the disabled state. The FULL output reflects the value of this register bit.

### ETF RAM read data register (ETF_RRD)

Address offset: 0x010

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RRD[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RRD[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RRD[31:0]**: RAM read data

Circular buffer mode: When in stopped state and the buffer is not empty, reading this register returns the next word of data from the trace buffer. When all of the trace buffer has been read, the EMPTY bit in the ETF_STS Register is set, and subsequent reads return 0xFFF FFFF. Reading this register when not in stopped state returns 0xFFFF FFFF.

Software FIFO mode: Reading this register returns data from the FIFO. If this register is read when the FIFO is empty, the data returned is 0xFFFF FFFF.

Hardware FIFO mode: Reading this register returns 0xFFFF FFFF.

### ETF RAM read pointer register (ETF_RRP)

Address offset: 0x014

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | RRP[12:0] | | | | | | | | | | | | |
| | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RRP[12:0]**: RAM read pointer

The RAM read pointer register contains the value of the read pointer that is used to read entries from the trace memory over the APB interface via the ETF_RRD register. The pointer can be programmed with a byte address, 64-bit aligned (bits 0 to 3 should be zero). The pointer is incremented by 8 each time a full 64-bit FIFO entry has been written. When the pointer reaches its maximum value, it wraps around.

This register can only be written in DISABLED state. It can be read in DISABLED state, in STOPPED state in circular buffer mode and SW FIFO mode, and also in RUNNING and STOPPING states in SW FIFO mode.

### ETF RAM write pointer register (ETF_RWP)

Address offset: 0x018

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | RWP[12:0] | | | | | | | | | | | | |
| | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RWP[12:0]**: RAM write pointer

The RAM rite Pointer Register contains the value of the write pointer that is used to write entries into the trace memory over the APB interface via the ETF_RWD register. The pointer can be programmed with a byte address, 64-bit aligned (meaning that bits 0 to 3 should be zero). The pointer is incremented by 8 each time a full 64-bit FIFO entry has been read. When the pointer reaches its maximum value, it wraps around.

This register can only be written in DISABLED state. It can be read in DISABLED state, in STOPPED state in circular buffer mode and SW FIFO mode, and also in RUNNING and STOPPING states in SW FIFO mode.

### ETF trigger counter register (ETF_TRG)

Address offset: 0x01C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | TRG[10:0] | | | | | | | | | | |
| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **TRG[10:0]**: trigger counter

In circular buffer mode, specifies the number of 32-bit words to capture in the trace RAM following the detection of either a rising edge on the TRIGIN input or a trigger packet in the incoming trace stream, ATID =7'h7D. On capturing the specified number of data words, a trigger event occurs. The effect of a trigger event on the ETF behavior is controlled by the ETF_FFCR register.

The number of 32-bit words written into the Trace RAM following the trigger is the value stored in this register, plus one. This register is ignored when the ETF is in software FIFO mode or hardware FIFO mode. When the trigger counter starts counting, any additional triggers, either on TRIGIN or in the incoming trace stream, are ignored until the counter reaches zero. When the trigger counter has reached zero, it remains at zero until it is re-programmed with a write to this register.

This register is cleared when READY goes HIGH, so that the state of the counter when trace capture has stopped does not affect a subsequent trace capture session. Writing to this register when not in DISABLED state results in unpredictable behavior.

A read access to this register is permitted at any time when in DISABLED state, or in circular buffer mode. A read access returns the current value of the trigger counter.

### ETF control register (ETF_CTL)

Address offset: 0x020

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TCEN |
| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TCEN:** trace capture enable

When writing:

0: disables trace capture (moves from RUNNING, STOPPING or STOPPED state into DISABLING or DISABLED state)

1: enables trace capture (moves from DISABLED state into RUNNING state)

When reading, this bit is low when in DISABLING or DISABLED states, and high otherwise.

### ETF RAM write data register (ETF_RWD)

Address offset: 0x024

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RWD[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RWD[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **RWD[31:0]**: RAM write data

When in DISABLED state, a write to this register stores data at the location pointed to by the RWP. Writes to this register when not in disabled state are ignored. When a full memory width (64-bit) of data has been written, the data is written to memory and the RAM write pointer is incremented to the next memory word.

This register is used for test purposes.

### ETF mode register (ETF_MODE)

Address offset: 0x028

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MODE[1:0] | |
| | | | | | | | | | | | | | | rw | rw |

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **MODE[1:0]**: operation mode

0: circular buffer mode. In this mode, the trace memory is used as a circular buffer. Trace data is captured into the trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition has occurred.

1: software FIFO mode. In this mode, the trace memory is used as a FIFO that can be read through the ETF_RRD Register while trace is being captured. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled.

2: hardware FIFO mode. In this mode, the trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled. When the trace buffer is non-empty, trace data is drained out through the ATB master interface to the TPIU.

3: reserved

### ETF latched buffer fill level register (ETF_LBUFLVL)

Address offset: 0x02C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | LBUFLEVEL[11:0] | | | | | | | | | | | |
| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **LBUFLEVEL[11:0]**: latched buffer fill level

Reading this register returns the maximum fill level of the trace memory in 32-bit words since this register was last read. Reading this register also results in its contents being updated to the current fill level.

When entering disabled state, this register retains its last value. While in disabled state, reads from this register do not affect its value. When exiting disabled state, the ETF_LBUFLVL register is cleared.

This register is used for performance analysis of the trace system.

### ETF current buffer fill level register (ETF_CBUFLVL)

Address offset: 0x030

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | CBUFLEVEL[11:0] | | | | | | | | | | | |
| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CBUFLEVEL[11:0]**: current buffer fill level

Reading this register returns the current fill level of the trace memory in 32-bit words.

This register is cleared when ETF_CTL.TCEN is low.

### ETF buffer level watermark register (ETF_BUFWM)

Address offset: 0x034

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | BUFWM[10:0] | | | | | | | | | | |
| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **BUFWM[10:0]**: buffer level watermark

The value programmed into this register indicates the required threshold vacancy level in 32-bit words in the trace memory. When the space in the FIFO is less than or equal to this value, that is, Fill level >= MEM_SIZE - BUFWM, the FULL output is pulled high and the FULL bit in the ETF_STS register is set.

This register is used only in software FIFO and hardware FIFO modes. In circular buffer mode, this functionality can be obtained by programming ETF_RWP to the required vacancy trigger level, so that when the pointer wraps around, the FULL bit is set indicating that the vacancy level has fallen below the required level.

The maximum value that can be written into this register is MEM_SIZE - 1; in this case, the FULL bit output is asserted after the first 32-bit word is written to trace memory.

Writing to this register other than when in DISABLED state results in unpredictable behavior.

### ETF formatter and flush status register (ETF_FFSR)

Address offset: 0x300

Reset value: 0x0000 0002

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FTSTOPPED | FLINPROG |
| | | | | | | | | | | | | | | rw | rw |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FTSTOPPED:** formatter stopped

This bit behaves in the same way as the FTEMPTY bit in the ETF_STS register.

Bit 0 **FLINPROG:** flush in progress

Indicates whether a flush on the ATB slave port is in progress. This bit reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the ETF_FFCR register, or requested by the ATB master port.

0: no flush in progress

1: flush in progress

### ETF formatter and flush control register (ETF_FFCR)

Address offset: 0x304

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | DRAINBUF | STPONTRGEV | STOPONFL | Res. | TRIGONFL | TRGONTRGEV | TRGONTRGIN | Res. | FLUSHMAN | FONTRGEV | FONFLIN | Res. | Res. | ENTI | ENFT |
| | rw | rw | rw | | rw | rw | rw | | rw | rw | rw | | | rw | rw |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **DRAINBUF:** drain buffer

This bit is used to enable draining of the trace data through the ATB master interface after the formatter has stopped. This is useful in circular buffer mode to capture trace data into trace memory and then to drain the captured trace through the ATB master interface.

Writing a one to this bit when in stopped state starts the drain of the contents of the trace buffer through the ATB master interface. This bit always reads as zero. The READY bit in the ETF_STS register goes low while the drain is in progress.

This bit is functional only when the ETF is in circular buffer mode and formatting is enabled, that is if the ENFT bit in the ETF_FFCR register is set. Setting this bit when the ETF is in any other mode, or when not in stopped state, results in unpredictable behavior.

When trace capture is complete in circular buffer mode, all of the captured trace must be retrieved from the trace memory through the same mechanism, either read all trace data out through ETF_RRD reads, or drain all trace data by setting the DRAINBUF bit. Setting the DRAINBUF bit after some of the captured trace has been read out through ETF_RRD results in unpredictable behavior.

Bit 13 **STPONTRGEV:** stop on trigger event

0: no effect

1: stop trace capture when a trigger event occurs

*Note: Enabling the ETF in software FIFO mode or hardware FIFO mode with this bit set results in unpredictable behavior.*

Bit 12 **STOPONFL:** stop on flush

0: no effect

1: stops trace capture when flush is completed

If a flush is initiated by the ATB master interface, its completion does not lead to a formatter stop regardless of the value programmed in this bit.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **TRIGONFL:** trigger on flush

0: no effect

1: indicates a trigger in the trace stream when flush is completed

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

If a flush is initiated by the ATB master interface, its completion does not lead to a trigger indication regardless of the value programmed in this bit.

Bit 9 **TRGONTRGEV:** trigger on trigger event

0: no effect

1: indicates a trigger in the trace stream when trigger event occurs

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

This bit is not supported in software FIFO mode or hardware FIFO mode.

Bit 8 **TRGONTRGIN:** trigger on trigger in

0: no effect

1: indicates a trigger in the trace stream when a rising edge is detected on the TRIGIN input

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FLUSHMAN:** manual flush

0: no effect

1: flushes the trace FIFO and pipeline

This bit is cleared automatically when the flush completes. If the TCEN bit in the ETF_CTL register is 0, writes to this bit are ignored.

Bit 5 **FONTRGEV:** flush on trigger event

0: no effect

1: flushes the trace FIFO and pipeline if a trigger event occurs

This bit is not supported in software FIFO mode or hardware FIFO mode. If STPONTRGEV is set, this bit is ignored.

Bit 4 **FONFLIN:** flush on flush in

0: no effect

1: flushes the trace FIFO and pipeline when a rising edge is detected on the FLUSHIN input

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ENTI**: enable trigger insertion

Setting this bit enables the insertion of triggers in the formatted trace stream. A trigger is indicated by inserting one byte of data 8'h00 with ATID 7'h7D in the trace stream. Trigger indication on the trace stream is additionally controlled by the register bits TRIGONFL, TRGONTRGEV, and TRGONTRGIN in the ETF_FFCR Register. This bit can only be changed when READY is high, and TCEN is low. This bit takes effect only when the ENFT register bit in this register is set. If the ENTI bit is set to high when ENFT is low, it results in formatting being enabled.

Bit 0 **ENFT**: enable formatting

0: formatting is disabled. Incoming trace data is assumed to be from a single trace source

1: formatting is enabled

If multiple ATIDs are received by the ETF when trace capture is enabled and the formatter is disabled, it results in interleaving of trace data. Disabling of formatting is supported only in circular buffer mode. If the ETF is enabled in a mode other than circular buffer mode with ENFT low, it results in formatting being enabled. If the ENTI bit is set to high when ENFT is low, it results in formatting being enabled.

This bit is ignored when in disabled state.

### ETF periodic synchronisation counter register (ETF_PSCR)

Address offset: 0x308

Reset value: 0x0000 000A

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PSCOUNT[4:0] | | | | |
| | | | | | | | | | | | rw | rw | rw | rw | rw |

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PSCOUNT[4:0]**: synchronization counter reload value

PSCOUNT determines the reload value of the synchronization counter. The reload value takes effect the next time the counter reaches zero. Reads from this register return the reload value programmed into this register. This register is set to 0xA on reset, corresponding to a synchronization period of 1024 bytes.

0x0: synchronization disabled

0x1-0x6: reserved

0x7-0x1B: synchronization period is $2^{PSCOUNT}$ bytes

Others: reserved

### ETF claim tag set register (ETF_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates there are four bits in claim tag

### ETF claim tag clear register (ETF_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

### ETF lock access register (ETF_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: ETF register write access enable

Enables write access to some ETF registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: enable write access

Other values: disable write access

### ETF lock status register (ETF_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE:** ETF_LAR register size
Indicates the size of the ETF_LAR register.
0: 32-bit

Bit 1 **LOCKGRANT:** current lock status
This bit always reads as zero by an external debugger.
0: write access is permitted
1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST:** lock control existence
Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
0: no lock control mechanism exists
1: lock control mechanism is implemented

### ETF authentication status register (ETF_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **MEMWIDTH[2:0]**: memory interface data bus width
0x3: 64 bits (corresponds to 32-bit ATB data)

Bits 7:6 **CONFIGTYP[1:0]**: configuration type of component (ETB, ETR or ETF)
0x2: ETF

Bit 5 **CLKSCHEM:** RAM clocking scheme (synchronous or asynchronous)
0x0: synchronous

Bits 4:0 **ATBINPORTCNT[4:0]**: number / type of ATB input port multiplexing
0x0: none

### ETF device type identifier register (ETF_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0032

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.10.6 Trace port interface unit (TPIU)

The TPIU is a CoreSight™ component that formats the trace stream and outputs it on the external trace port signals. The TPIU has a single ATB slave port for incoming trace data. The trace port is a synchronous parallel port, comprising a clock output, TRACECLK, and sixteen data outputs, TRACED(15:0). The trace port width is programmable in the range 1 to 16. Using a smaller port width reduces the number of test points/connector pins needed, and frees up IOs for other purposes. However it restricts the bandwidth of the trace port and hence the quantity of trace information that can be output in real time.

For more information on the Trace Port Interface CoreSight™ component, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual [2]*.

### Trace port interface unit registers

### TPIU supported port size register (TPIU_SUPPSIZE)

Address offset: 0x000

Reset value: 0x0000 FFFF

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PORTSIZE[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PORTSIZE[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **PORTSIZE[31:0]**: supported trace port sizes

Indicates supported trace port sizes, from 1 to 32 pins. Bit n-1 when set indicates that port size n is supported.

0x0000 FFFF: port sizes 1 to 16 supported

### TPIU current port size register (TPIU_CURPSIZE)

Address offset: 0x004

Reset value: 0x0000 FFFF

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PORTSIZE[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PORTSIZE[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **PORTSIZE[31:0]**: current trace port size

Indicates current trace port size. Bit n-1 when set indicates that the current port size is n pins. The value of n must be within the range of supported port sizes (1-4). Only one bit can be set, or unpredictable behavior may result. This register should only be modified when the formatter is stopped.

### TPIU supported trigger modes register (TPIU_SUPTRGM)

Address offset: 0x100

Reset value: 0x0000 011F

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | r | | | | r | r | r | r | r |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **TRGRUN**: trigger running

0: trigger has not occurred or counter is at 0

1: trigger has occurred and counter is not at 0

Bit 16 **TRIGD**: triggered

0: trigger has not occurred

1: trigger has occurred and counter has reached 0

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **TCOUNT8**: 8-bit counter register

1: implemented

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **MULT64K**: multiplying the trigger counter by 65536 support

1: supported

Bit 3 **MULT256**: multiplying the trigger counter by 256 support

1: supported

Bit 2 **MULT16**: multiplying the trigger counter by 16 support
1: supported

Bit 1 **MULT4**: multiplying the trigger counter by 4 support
1: supported

Bit 0 **MULT2**: multiplying the trigger counter by 2 support
1: supported

### TPIU trigger counter value register (TPIU_TRGCNT)

Address offset: 0x104

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIGCOUNT[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGCOUNT[7:0]**: trigger delay to external enable
Enables delaying the indication of triggers to any external connected trace capture or storage devices.
This counter is only eight-bit wide and is intended to be used only with the counter multipliers in the TPIU_TRGMULT trigger multiplier register. When a trigger is started, this value, in combination with the multiplier, is the number of words before the trigger is indicated. When the trigger counter reaches 0, the value written here is reloaded. Writing to this register causes the trigger counter value to reset but does not reset any values on the multiplier. Reading this register returns the preset value, not the current count.

### TPIU trigger multiplier register (TPIU_TRGMULT)

Address offset: 0x108

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | r | r | r | r |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **PCONTEN**: continuous mode support
Indicates whether continuous mode is supported.
1: supported

Bit 16 **PTIMEEN**: timed mode support
Indicates whether timed mode is supported.
1: supported

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PATF0**: FF/00 pattern support
Indicates whether the FF/00 pattern is supported as output over the trace port.
1: supported

Bit 2 **PATA5**: AA/55 pattern support
Indicates whether the AA/55 pattern is supported as output over the trace port.
1: supported

Bit 1 **PATW0**: walking 0's pattern support
Indicates whether the walking 0's pattern is supported as output over the trace port.
1: supported

Bit 0 **PATW1**: walking 1's pattern support
Indicates whether the walking 1's pattern is supported as output over the trace port.
1: supported

### TPIU current test pattern/mode register (TPIU_CURTPM)

Address offset: 0x204

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **PCONTEN**: continuous mode enable
Indicates whether continuous mode is enabled.
0: disabled
1: enabled

Bit 16 **PTIMEEN**: timed mode enable
Indicates whether timed mode is enabled.
0: disabled
1: enabled

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PATF0**: FF/00 pattern enable
Indicates whether the FF/00 pattern is enabled as output over the trace port.
0: disabled
1: enabled

Bit 2 **PATA5**: AA/55 pattern enable
Indicates whether the AA/55 pattern is enabled as output over the trace port.
0: disabled
1: enabled

Bit 1 **PATW0**: walking 0's pattern enable
Indicates whether the walking 0's pattern is enabled as output over the trace port.
0: disabled
1: enabled

Bit 0 **PATW1**: walking 1's pattern enable
Indicates whether the walking 1's pattern is enabled as output over the trace port.
0: disabled
1: enabled

### TPIU test pattern repeat counter register (TPIU_TPRCR)

Address offset: 0x208

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PATTCOUNT[7:0]**: pattern number of TRACECLKIN cycles
8-bit counter value to indicate the number of TRACECLKIN cycles for which a pattern runs before it switches to the next pattern.

### TPIU formatter and flush status register (TPIU_FFSR)

Address offset: 0x300

Reset value: 0x0000 0002

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TCPRESENT | FTSTOPPED | FLINPROG |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TCPRESENT**: TRACECTL output pin is availability

Indicates whether the optional TRACECTL output pin is available for use.

0: TRACECTL pin is not present in this device

Bit 1 **FTSTOPPED**: formatter stopped

The formatter has received a stop request signal and all trace data and post-amble is sent. Any additional trace data on the ATB interface is ignored.

0: formatter has not stopped

1: formatter has stopped

Bit 0 **FLINPROG**: flush in progress

Indicates whether a flush on the ATB slave port is in progress. This bit reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the TPIU_FFCR register.

0: no flush in progress

1: flush in progress

### TPIU formatter and flush control register (TPIU_FFCR)

Address offset: 0x304

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | STOPTRIG | STOPFL | Res. | TRIGFL | TRIGEVT | TRIGIN | Res. | FONMAN | FONTRIG | FONFLIN | Res. | Res. | ENFCONT | ENFTC |
| | | rw | rw | | rw | rw | rw | | rw | rw | rw | | | rw | rw |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **STOPTRIG**: stop on trigger event

0: no effect

1: stop formatter when a trigger event occurs

Bit 12 **STOPFL**: stop on flush

0: no effect

1: stop formatter when flush is completed

Bit 11 Reserved, must be kept at reset value.

Bit 10 **TRIGFL**: trigger on flush

0: no effect

1: indicates a trigger in the trace stream when flush is completed

Bit 9 **TRIGEVT**: trigger on trigger event

0: no effect

1: indicates a trigger in the trace stream when trigger event occurs

Bit 8 **TRIGIN**: trigger on trigger in
0: no effect
1: indicates a trigger in the trace stream when the TRIGIN input from the system CTI is asserted.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FONMAN**: generates a manual flush
0: no effect
1: flush the trace
This bit is cleared automatically when the flush completes.

Bit 5 **FONTRIG**: flush on trigger event
A trigger event occurs when the trigger counter reaches 0, or, if the trigger counter is 0, when the TRIGIN input from the system CTI is high.
0: no effect
1: flushes the trace if a trigger event occurs

Bit 4 **FONFLIN**: flush on flush in
0: no effect
1: flushes the trace if the FLUSHIN input from the system CTI is asserted

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ENFCONT**: enables continuous formatting
0: continuous formatting is disabled
1: continuous formatting is enabled

Bit 0 **ENFTC**: enables the embedding of triggers in formatted trace
0: formatting is disabled
1: formatting is enabled

### TPIU formatter synchronisation counter register (TPIU_FSCR)

Address offset: 0x308

Reset value: 0x0000 0040

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CYCCOUNT[4:0] | | | | |
| | | | | | | | | | | | rw | rw | rw | rw | rw |

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **CYCCOUNT[4:0]**: formatted frame number

Enables effective use of different sized TPAs without wasting large amounts of the storage capacity of the capture device.

This counter contains the number of formatter frames since the last synchronization packet of 128 bits. It is a 12-bit counter with a maximum count value of 4096. This equates to synchronization every 65536 bytes, that is, 4096 packets x 16 byte per packet. The default is set up for a synchronization packet every 1024 bytes, that is, every 64 formatter frames. If the formatter is configured for continuous mode, full and half-word sync frames are inserted during normal operation. Under these circumstances, the count value is the maximum number of complete frames between full synchronization packets.

### TPIU claim tag set register (TPIU_CLAIMSET)

Address offset: 0xFA0

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits

Write:

- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:

- 0xF: indicates there are four bits in claim tag

### TPIU claim tag clear register (TPIU_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

### TPIU lock access register (TPIU_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: TPIU register write access enable

Enables write access to some TPIU registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: enable write access

Other values: disable write access

### TPIU lock status register (TPIU_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: TPIU_LAR register size
Indicates the size of the TPIU_LAR register.
0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
This bit always reads as zero by an external debugger.
0: write access is permitted
1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
0: no lock control mechanism exists
1: lock control mechanism is implemented

### TPIU authentication status register (TPIU_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
0x0: not implemented

### TPIU device configuration register (TPIU_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 00A0

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | SWOUARTNRZ | SWOMAN | TCLKDATA | FIFOSIZE[2:0] | | | CLKRELAT | MAXNUM[4:0] | | | | |
| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **SWOUARTNRZ**: Serial Wire Output, UART or NRZ support
Indicates whether Serial Wire Output, UART or NRZ, is supported.
0x0: not supported

Bit 10 **SWOMAN**: Serial Wire Output, Manchester support
Indicates whether Serial Wire Output, Manchester encoded format, is supported.
0x0: not supported

Bit 9 **TCLKDATA**: trace clock plus data support
Indicates whether trace clock plus data is supported.
0x0: not supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2
0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT**: ATB clock and TRACECLKIN sync
Indicates the relationship between the ATB clock and TRACECLKIN (synchronous or asynchronous).
0x1: asynchronous

Bits 4:0 **MAXNUM[4:0]**: number / type of ATB input port multiplexing
0x0: none

### TPIU device type identifier register (TPIU_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0032

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: sub-classification
0x1: trace port component

Bits 3:0 **MAJORTYPE[3:0]**: major classification
0x1: trace sink component

### TPIU CoreSight peripheral identity register 4 (TPIU_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size
0x0: register file occupies a single 4 Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code
0x4: Arm® JEDEC code

### TPIU CoreSight peripheral identity register 0 (TPIU_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0012

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.10.7 Serial wire output (SWO)

The SWO is a CoreSight™ component that formats the trace stream from the Cortex®-M4 processor ITM and outputs it on the single wire TRACESWO output.

Compared to the TPIU, the SWO contains:

- no formatter
- no pattern generator
- an 8-bit ATB input
- no synchronous trace output (no TRACEDATA or TRACECLK pins)
- no support for flush
- no support for triggering

The SWO output supports Manchester encoded and UART NRZ formats.

For more information about the Serial Wire Output CoreSight™ component, refer to the *Arm® CoreSight™ Components Technical Reference Manual [4]*.

### Serial wire output registers

### SWO current output divisor register (SWO_CODR)

Address offset: 0x010

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | PRESCALER[12:0] | | | | | | | | | | | | |
| | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **PRESCALER[12:0]**: 13-bit counter pre-load value

This register allows to scale the baud rate of the SWO output. The baud rate is the trace clock frequency divided by (PRESCALER - 1).

*Note: The baud rate changes instantly; it is recommended to stop the trace source and wait until the port is idle before writing this register.*

### SWO selected pin protocol register (SWO_SPPR)

Address offset: 0x0F0

Reset value: 0x0000 0001

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PPROT[1:0] | |
| | | | | | | | | | | | | | | rw | rw |

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **PPROT[1:0]**: pin protocol

0x0: reserved
0x1: Manchester
0x2: NRZ
0x3: reserved

### SWO formatter and flush status register (SWO_FFSR)

Address offset: 0x300

Reset value: 0x0000 0008

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FTNONSTOP | TCPRESENT | FTSTOPPED | FLINPROG |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **FTNONSTOP**: no need to stop formatter to change settings

1: formatter can not be stopped

Bit 2 **TCPRESENT**: TRACECTL pin presence
0: TRACECTL pin is not present on SWO

Bit 1 **FTSTOPPED**: formatter stopped
0: formatter stopping is not supported

Bit 0 **FLINPROG**: flush in progress
0: flushing is not supported

### SWO claim tag set register (SWO_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: sets claim tag bits
Write:
- 0000: no effect
- xxx1: sets bit 0
- xx1x: sets bit 1
- x1xx: sets bit 2
- 1xxx: sets bit 3

Read:
- 0xF: indicates there are four bits in claim tag

### SWO claim tag clear register (SWO_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: resets claim tag bits

Write:

- 0000: no effect
- xxx1: clears bit 0
- xx1x: clears bit 1
- x1xx: clears bit 2
- 1xxx: clears bit 3

Read:

- Returns current value of claim tag

### SWO lock access register (SWO_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: SWO register write access enable

Enables write access to some SWO registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: enable write access

Other values: disable write access

### SWO lock status register (SWO_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: SWO_LAR register size
Indicates the size of the SWO_LAR register.
0: 32-bit

Bit 1 **LOCKGRANT**: current lock status
This bit always reads as zero by an external debugger.
0: write access is permitted
1: write access is blocked. Only reads are permitted.

Bit 0 **LOCKEXIST**: lock control existence
Indicates whether a lock control mechanism exists. This bit always reads as zero by an external debugger.
0: no lock control mechanism exists
1: lock control mechanism is implemented

### SWO authentication status register (SWO_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
0x0: not implemented

### SWO device configuration register (SWO_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0EA0

| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **SWOUARTNRZ**: Serial Wire Output, UART or NRZ support
Indicates whether Serial Wire Output, UART or NRZ, is supported.
0x0: not supported

Bit 10 **SWOMAN**: Serial Wire Output, Manchester support
Indicates whether Serial Wire Output, Manchester encoded format, is supported.
0x0: not supported

Bit 9 **TCLKDATA**: trace clock plus data support
Indicates whether trace clock plus data is supported.
0x0: not supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2
0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT:** ATB clock and TRACECLKIN synchronization
Indicates the relationship between the ATB clock and TRACECLKIN (synchronous or asynchronous).
0x1: asynchronous

Bits 4:0 **MAXNUM[4:0]**: number / type of ATB input port multiplexing
0x0: none

### SWO device type identifier register (SWO_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0011

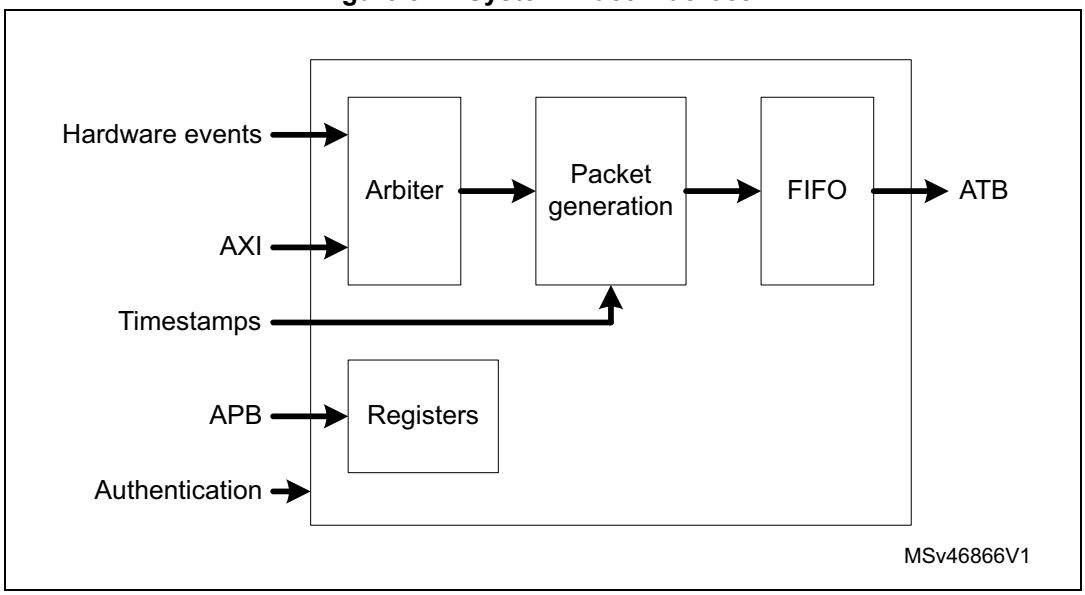
## 66.10.8 System trace macrocell (STM)

The System Trace Macrocell is a CoreSight™ component which allows instrumentation data generated by software to be incorporated in the trace output. The software writes the instrumentation data to the STM via a memory-mapped port on the AXI system interconnect. The data is formatted and time-stamped for output on the ATB trace bus, where it is merged with the trace coming from other sources (ETM, ITM).

**Figure 822. System Trace Macrocell**



The STM is configured with the following values:

- DATA_FIFO_DEPTH = 16
- CHN_FIFO_DEPTH = 8
- HW_EVOBIF_PRESENT = TRUE
- AXI_ID_WIDTH = 11

The various AXI masters can generate trace by writing to the extended stimulus ports of the STM via its AXI slave port, which is mapped in a 16-Mbyte window of address space (see memory map). A 256-byte extended stimulus port comprises 16 x 64-bit locations or registers. Writes to different locations generate different types of trace packets, as shown in *Table 569*. The base address for stimulus port n is the STM base address + n x 256. A master can use any number of the 65536 available stimulus ports mapped in the 16 Mbyte-window.

**Table 569. STM extended stimulus port memory map**

| Address offset | Name | Description |
|---|---|---|
| 0x00 | G_DMTS | Data, marked with timestamp, guaranteed |
| 0x08 | G_DM | Data, marked, guaranteed |
| 0x10 | G_DTS | Data, with timestamp, guaranteed |
| 0x18 | G_D | Data, guaranteed |
| 0x20-0x58 | - | Reserved |
| 0x60 | G_FLAGTS | Flag with timestamp, guaranteed |
| 0x68 | G_FLAG | Flag, guaranteed |
| 0x70 | G_TRIGTS | Trigger with timestamp, guaranteed |
| 0x78 | G_TRIG | Trigger, guaranteed |
| 0x80 | I_DMTS | Data, marked with timestamp, invariant timing |
| 0x88 | I_DM | Data, marked, invariant timing |
| 0x90 | I_DTS | Data, with timestamp, invariant timing |
| 0x98 | I_D | Data, invariant timing |
| 0xA0 to 0xD8 | - | Reserved |
| 0xE0 | I_FLAGTS | Flag with timestamp, invariant timing |
| 0xE8 | I_FLAG | Flag, invariant timing |
| 0xF0 | I_TRIGTS | Trigger with timestamp, invariant timing |
| 0xF8 | I_TRIG | Trigger, invariant timing |

The trace packets contain the 8-bit identity of the master that triggered them. This identity is decoded from the non-secure master ID (NSAID) carried on the AWUSER wires of the AXI interconnect, together with the AWID signals which identify which of the two Cortex®-A7 CPU cores performed the write. The ID also includes the security status of the master at the time.

The ID is mapped as follows:

- Bit [7] = 0
- Bit [6] = secure/non-secure state
- Bit [5:0] = master ID

A list of valid IDs and how they map to the originating master is given in *Table 570*.

**Table 570. STM trace packet ID mapping to AXI masters**

| Master | Secure access ID | Non-secure access ID |
|---|---|---|
| Cortex®-A7 CPU1 | 0x00 | 0x40 |
| Cortex®-A7 CPU2 | 0x01 | 0x41 |
| Cortex®-M4 | 0x02 | 0x42 |
| MDMA | 0x0A | 0x4A |

**Table 570. STM trace packet ID mapping to AXI masters (continued)**

| Master | Secure access ID | Non-secure access ID |
|---|---|---|
| DMA1/2 | - | 0x4C |
| DAP | 0x1E | 0x5E |

The STM can also generate trace packets or triggers when certain hardware events are detected. A maximum of 64 events can be traced at any one time. An external multiplexer allows four sets of signals to be mapped onto these events. The mapping is given in *Table 571* and *Table 572*. All events are edge sensitive.

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **HEE[31:0]**: hardware event enable

HEE is used to enable hardware events to generate trace. The register defines one bit per hardware event.

0: hardware event disabled

1: hardware event enabled

### Hardware event trigger enable register (STM_HETER)

Address offset: 0xD20

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| HETE[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HETE[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **HETE[31:0]**: trigger generation enable

HETE is a bit mask used to enable trigger generation on hardware events. The register defines one bit per hardware event.

0: disabled

1: enabled

### Hardware event bank select register (STM_HEBSR)

Address offset: 0xD60

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HEBS |
| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **HEBS**: hardware event bank selector

HEBS is used to select the bank of 32 hardware events to control, see *Table 571: Hardware event mapping 0 to 3*).

0: bank 0

1: bank 1

### Hardware event main control register (STM_HEMCR)

Address offset: 0xD64

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ATBTRIGEN | TRIGCLEAR | TRIGSTATUS | TRIGCTL | Res. | ERRDETECT | COMPEN | EN |
| | | | | | | | | rw | rw | r | rw | | r | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ATBTRIGEN**: ATB trace trigger enable

When set, this bit enables the STM to use the ATID value of 0x7D when a trigger event on match using STMHETER occurs.

0: do not output ATB trace triggers

1: use ATB trace triggers

Bit 6 **TRIGCLEAR**: clear trigger status

When TRIGCTL indicates single-shot mode, this bit is used to clear TRIGSTATUS. Writing a 1 to this bit when in multi-shot mode is unpredictable.

0: no effect

1: clears TRIGSTATUS if TRIGSTATUS is 1

Bit 5 **TRIGSTATUS**: trigger status

When TRIGCTL indicates single-shot mode, this indicates whether the single trigger has occurred.

0: trigger has not occurred

1: trigger has occurred

Bit 4 **TRIGCTL**: trigger control

0: triggers are multi-shot

1: triggers are single-shot

Bit 3 Reserved, must be kept at reset value.

Bit 2 **ERRDETECT**: error detection
Enable error detection on the hardware event tracing.
0: error detection disabled
1: error detection enabled.

Bit 1 **COMPEN**: compression enable
Enable leading zero suppression of hardware event data values in the trace stream.
0: compression disabled
1: compression enabled.

Bit 0 **EN**: enable hardware event tracing
0: disabled
1: enabled

### Hardware event external multiplex control register (STM_HEEXTMUXR)

Address offset: 0xD68

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EXTMUX[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **EXTMUX[7:0]**: signals for events selector
Selects the signals to be mapped onto the 64 hardware events that can be traced by the STM (refer to *Table 571* and *Table 572*).

### Hardware event master number register (STM_HEMASTR)

Address offset: 0xDF4

Reset value: 0x0000 0080 (0x0000 FFFF)

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MASTER[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MASTER[15:0]**: STPv2 master number

Indicates the STPv2 master number of hardware event trace. This number is the master number presented in STPv2.

0x80: hardware events are associated with master 0x80

Others: reserved

### Hardware event features 1 register (STM_HEFEAT1R)

Address offset: 0xDF8

Reset value: 0x3020 0035

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | HEEXTMUXSIZE[2:0] | | | Res. | Res. | Res. | Res. | NUMHE[8:1] | | | | | | | |
| | r | r | r | | | | | r | r | r | r | r | r | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| NUMHE[0] | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HECOMP[1:0] | | HEMASTR | HEERR | Res. | HETER |
| r | | | | | | | | | | r | r | r | r | | r |

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **HEEXTMUXSIZE[2:0]**: EXTMUX bit field size

Indicates the size of the EXTMUX bit field of register STM_HEEXTMUXR.

0x3: 8-bit wide (up to 256 multiplexers)

Others: reserved

Bits 27:24 Reserved, must be kept at reset value.

Bits 23:15 **NUMHE[8:0]**: number of hardware events supported by the STM

0x40: 64 hardware events

Bits 14:6 Reserved, must be kept at reset value.

Bits 5:4 **HECOMP[1:0]**: data compression on hardware event tracing support

0x3: data compression support is programmable. The COMPEN bit of register STM_HEMCR is implemented.

Bit 3 **HEMASTR**: STMHEMASTR support

0: STMHEMASTR is read-only

Bit 2 **HEERR**: hardware event error detection support.

1: hardware event error detection implemented. The ERRDETECT bit of register STM_HEMCR is implemented.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **HETER**: STM_HETER support

1: STM_HETER implemented.

### Hardware event features ID register (STM_HEIDR)

Address offset: 0xDFC

Reset value: 0x0000 0011

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | VENDSPEC[3:0] | | | | CLASSREV[3:0] | | | | CLASS[3:0] | | | |
| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **VENDSPEC[3:0]**: vendor specific

Identifies any vendor specific modifications or mappings.
0: vendor specific information
Others: reserved

Bits 7:4 **CLASSREV[3:0]**: programmer model revision

Identifies the revision of the programmer model.
1: revision
Others: reserved

Bits 3:0 **CLASS[3:0]**: programmer model

Identifies the programmers model.
1: hardware event control
Others: reserved

### Stimulus port enable register (STM_SPER)

Address offset: 0xE00

Reset value: 0x0000 0000

This read/write only register is used to enable the stimulus registers to generate trace. The register defines one bit per stimulus register. Writing 1 enables the appropriate stimulus port, writing 0 disables the appropriate stimulus port. This register is used in conjunction with the Software Enable Bank Select Register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| SPE[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SPE[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **SPE[31:0]**: stimulus port enable

This register is used to enable the stimulus registers to generate trace. It defines one bit per stimulus register. Writing 1 enables the appropriate stimulus port, writing 0 disables the appropriate stimulus port. This register is used in conjunction with the Software Enable Bank Select Register.
0: stimulus port disabled
1: stimulus port enabled

### Stimulus port trigger enable register (STM_SPTER)

Address offset: 0xE20

Reset value: 0x0000 0000

This register is used to enable trigger generation on writes to enabled stimulus port registers.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| SPTE[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SPTE[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **SPTE[31:0]**: trigger generation trigger generation bit mask

This register is a bit mask used to enable trigger generation on writes to enabled stimulus port registers. It defines one bit per stimulus port register.

0: disabled

1: enabled

### Stimulus port select configuration register (STM_SPSCR)

Address offset: 0xE60

Reset value: 0x0000 0000

This register allows a debugger to program which stimulus ports the STM_SPER and STM_SPTER registers apply to.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PORTSEL[11:0] | | | | | | | | | | | | Res. | Res. | Res. | Res. |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PORTCTL[1:0] | |
| | | | | | | | | | | | | | | rw | rw |

Bits 31:20 **PORTSEL[11:0]**: stimulus port selector

Defines which stimulus ports the STM_SPTER and/or STM_SPER registers apply to.

Bits 19:2 Reserved, must be kept at reset value.

Bits 1:0 **PORTCTL[1:0]**: port selection control mode

Defines how the port selection is applied.

0x0: port selection not used

0x1: port selection applies only to the STM_SPTER register

0x2: reserved

0x3: port selection applies to both the STM_SPER and STM_SPTER

### Stimulus port master select configuration register (STM_SPMSCR)

Address offset: 0xE64

Reset value: 0x0000 0000

This register allows a debugger to program which masters the STM_SPSCR register applies to.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MASTSEL[7:1] | | | | | | |
| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MASTSEL[0] | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MASTCTL |
| rw | | | | | | | | | | | | | | | rw |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:15 **MASTSEL[7:0]**:master select
This field defines which master the STM_SPSCR register applies to.

Bits 14:1 Reserved, must be kept at reset value.

Bit 0 **MASTCTL**: master control mode
Defines how the master is applied.
0: master selection not used
1: port selection applies to the STM_SPSCR register

### Stimulus port override control register (STM_SPOVERRIDER)

Address offset: 0xE68

Reset value: 0x0000 0000

This register allows a debugger to override various features of the STM.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PORTSEL[16:1] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PORTSEL[0] | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OVERTS | OVERCTL[1:0] | |
| rw | | | | | | | | | | | | | rw | rw | rw |

Bits 31:15 **PORTSEL[16:0]**: port override select
Defines which stimulus ports the override controls apply to.

Bits 14:3 Reserved, must be kept at reset value.

Bit 2 **OVERTS**: override timestamp request

This override requests all stimulus port writes that cause trace to be traced with a timestamp (when possible). As with normal operation, this does not ensure that all packets are generated with timestamps. This field is independent from OVERCTL and PORTSEL.

0: override not enabled

1: override enabled

Bits 1:0 **OVERCTL[1:0]**: override control mode

Defines how port selection is applied.

0x0: override controls disabled

0x1: ports selected by PORTSEL always behave as guaranteed transactions

0x2: ports selected by PORTSEL always behave as invariant timing transactions

0x3: reserved

### Stimulus port master override control register (STM_SPMOVERRIDER)

Address offset: 0xE6C

Reset value: 0x0000 0000

This register allows a debugger to select which masters the STM_SPOVERRIDERR applies to.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MASTSEL[7:1] | | | | | | |
| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MASTSEL[0] | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MASTCTL |
| rw | | | | | | | | | | | | | | | rw |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:15 **MASTSEL[7:0]**: master port override selection

This field defines which master ports the override controls apply to. The size of this field is defined by the number of implemented masters.

Bits 14:1 Reserved, must be kept at reset value.

Bit 0 **MASTCTL**: master selection control mode

Defines how the master selection is applied.

0: override controls disabled. STM_SPOVERRIDERR applies equally to all masters.

1: master selection enabled. STM_SPOVERRIDERR applies to the masters selected by MASTSEL.

### Stimulus port trigger control and status register (STM_SPTRIGCSR)

Address offset: 0xE70

Reset value: 0x0000 0000

This register is used to control the STM triggers induced by STM_SPTER.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ATBTRIGEN_DIR | ATBTRIGEN_TE | TRIGCLEAR | TRIGSTATUS | TRIGCTL |
| | | | | | | | | | | | rw | rw | w | r | rw |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **ATBTRIGEN_DIR**: ATB trace on write to TRIG

When set, this bit enables the STM to use the ATID value of 0x7D when a trigger event on writes to TRIG location occurs.

0: does not output ATB trace triggers on write to TRIG location

1: outputs ATB trace trigger for trigger on write to TRIG location

Bit 3 **ATBTRIGEN_TE**: ATB trace trigger output

When set, this bit enables the STM to use the ATID value of 0x7D when a trigger event on match using STM_SPTER occurs.

0: does not output ATB trace trigger for trigger on match using STM_SPTER

1: outputs ATB trace trigger for trigger on match using STM_SPTER

Bit 2 **TRIGCLEAR**: trigger status clear

When bit TRIGCTL indicates single-shot mode, TRIGCLEAR is used to clear TRIGSTATUS. Writing a 1 to this bit when in multi-shot mode is leads to unpredictable behavior.

0: no effect

1: clears TRIGSTATUS if TRIGSTATUS is 1

Bit 1 **TRIGSTATUS**: trigger status

When bit TRIGCTL indicates single-shot mode, TRIGSTATUS indicates whether the single trigger has occurred.

0: trigger has not occurred

1: trigger has occurred

Bit 0 **TRIGCTL**: trigger control

0: triggers are multi-shot

1: triggers are single-shot

### Trace control and status register (STM_TCSR)

Address offset: 0xE80

Reset value: 0x0000 0004

Controls STM settings.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BUSY | TRACEID[6:0] | | | | | | |
| | | | | | | | | r | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | COMPEN | Res. | Res. | SYNCEN | TSEN | EN |
| | | | | | | | | | | rw | | | r | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **BUSY**: STM busy

Indicates if the STM is busy, for example because STM trace FIFO is not empty.

0: STM is not busy

1: STM is busy.

Bits 22:16 **TRACEID[6:0]**: ATB Trace ID

Bits 15:6 Reserved, must be kept at reset value.

Bit 5 **COMPEN**: compression enable for stimulus ports

0: compression disabled, data transfers are transmitted at the size of the transaction

1: compression enabled, data transfers are compressed to save bandwidth

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **SYNCEN**: STM_SYNCR implementation

STM_SYNCR is implemented; this value is RAO.

1: STM_SYNCR implemented

Bit 1 **TSEN**: timestamp requests enable

This bit controls if timestamp requests are ignored or taken into account.

0: timestamping disabled. Requests for timestamp generation are ignored, and stimulus port writes selecting timestamping are treated as if it were not selected.

1: timestamping enabled. If stimulus writes select timestamping, a timestamp is output according to STPv2.

Bit 0 **EN**: global STM enable

0: STM disabled

1: STM enabled

### Timestamp stimulus register (STM_TSSTIMR)

Address offset: 0xE84

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FORCETS |
| | | | | | | | | | | | | | | | w |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **FORCETS**: force timestamp stimulus

A write to register STM_TSSTIMR with bit FORCETS as 1 requests the next stimulus port write which causes trace to be upgraded to have a timestamp. Writes with this bit as 0 are ignored.

1: force timestamp stimulus

### Timestamp frequency register (STM_TSFREQR)

Address offset: 0xE8C

Reset value: 0x0000 0000

This register is used to indicate the frequency of the timestamp counter. The unit of measurement is increments per second. When the STPv2 protocol is used, this register contains the value output in the FREQ and FREQ_TS packets. The timestamp frequency is output in the STPv2 protocol at every synchronization point when bit TSEN STM_TCSR is 1.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FREQ[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| FREQ[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **FREQ[31:0]**: timestamp frequency

Indicates the frequency of the timestamp counter in Hz.

### Synchronization control register (STM_SYNCR)

Address offset: 0xE90

Reset value: 0x0000 0000

This register controls the interval between synchronization packets as a function of the number of bytes of trace generated. This register only provides a hint of the desired synchronization frequency since implementations are permitted to be inaccurate. Writing a value of 0x0000 0000 to this register disables the synchronization counter however any other implementation defined synchronization mechanism continues to operate independently (refer to register *Auxiliary control register (STM_AUXCR)*).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | MODE | COUNT[8:0] | | | | | | | | | Res. | Res. | Res. |
| | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | |

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **MODE**: mode control
0: COUNT[8:0] defines a value N. Synchronization period is 8 x N bytes.
1: COUNT[8:4] defines a value N. Synchronization period is 2^N bytes. N must be in the range of 0d12 to 0d27 inclusive; other values lead to unpredictable results.

Bits 11:3 **COUNT[8:0]**: number of bytes between synchronization packets
Indicates the counter value for the number of bytes between synchronization packets. Reads return the value of this register.

Bits 2:0 Reserved, must be kept at reset value.

### Auxiliary control register (STM_AUXCR)

Address offset: 0xE94

Reset value: 0x0000 0000

This register is used for implementation defined STM controls.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | QHWEVOVERRIDE | Res. | Res. | Res. | Res. | PRIORINVDIS | ASYNCPE | FIFOAF |
| | | | | | | | | rw | | | | | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **QHWEVOVERRIDE**: override control for the Q-Channels
0: no override. Q-Channel is able to accept a quiescence request when hardware event tracing is enabled.
1: override. Q-Channel denies a quiescence request when hardware event tracing is enabled.

Bits 6:3 Reserved, must be kept at reset value.

Bit 2 **PRIORINVDIS**: AXI vs. HW flush arbitration
Controls arbitration between AXI and HW during flush.
0: priority inversion. When AXI flush is finished, HW gets priority until HW flush is done.
1: priority inversion disabled. AXI always has priority over HW.

Bit 1 **ASYNCPE**: ASYNC priority
0: ASYNC priority is always lower than trace
1: ASYNC priority increases on second synchronization request

Bit 0 **FIFOAF**: auto-flush
0: auto-flush disabled
1: auto-flush enabled

### STM features 1 register (STM_FEAT1R)

Address offset: 0xEA0

Reset value: 0x0065 87D1

This register indicates the features of the STM in conjunction with registers STM_FEAT2R and STM_FEAT3R.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SWOEN[1:0] | | SYNCEN[1:0] | | HWTEN[1:0] | | TSPRESCALE[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TRIGCTL[1:0] | | TRACEBUS[3:0] | | | | SYNC[1:0] | | FORCETS | TSFREQ | TS[1:0] | | PROT[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **SWOEN[1:0]**: SWOEN support
Support of bit SWOEN of register STM_TCSR.
0x1: bit SWOEN of register STM_TCSR is not implemented

Bits 21:20 **SYNCEN[1:0]**: SYNCEN support
Support of bit SYNCEN of register STM_TCSR.
0x2: bit SYNCEN of register STM_TCSR is implemented but always reads as 1

Bits 19:18 **HWTEN[1:0]**: HWTEN support
Support of bit HWTEN of register STM_TCSR.
0x1: bit HWTEN of register STM_TCSR is not implemented

Bits 17:16 **TSPRESCALE[1:0]**: timestamp prescale support
0x1: timestamp prescale not implemented

Bits 15:14 **TRIGCTL[1:0]**: trigger control support
0x2: multi-shot and single-shot triggers supported. STM_TRIGCSR is implemented.

Bits 13:10 **TRACEBUS[3:0]**: trace bus support
0x1: CoreSight™ ATB plus ATB trigger support implemented. Field TRACEID of register STM_TCSR, and bits ATBTRIGEN_DIR and ATBTRIGEN_TE of register STM_SPTRIGCSR are implemented.

Bits 9:8 **SYNC[1:0]**: STM_SYNCR support
0x3: STM_SYNCR implemented with MODE control

Bit 7 **FORCETS**: STM_TSSTIMR support
1: bit FORCETS of register STM_TSSTIMR is implemented

Bit 6 **TSFREQ**: Timestamp frequency indication configuration
1: STM_TSFREQR is read-write

Bits 5:4 **TS[1:0]**: Timestamp support
0x1: absolute timestamps implemented

Bits 3:0 **PROT[3:0]**: Protocol
0x1: STPv2 protocol

### STM features 2 register (STM_FEAT2R)

Address offset: 0xEA4

Reset value: 0x0001 14F2

This register indicates the features of the STM in conjunction with registers STM_FEAT1R and STM_FEAT3R.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SPTYPE[1:0] | |
| | | | | | | | | | | | | | | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DSIZE[3:0] | | | | Res. | SPTRTYPE[1:0] | | PRIVMASK[1:0] | | SPOVERRIDE | SPCOMP[1:0] | | Res. | SPER | SPTER[1:0] | |
| r | r | r | r | | r | r | r | r | r | r | r | | r | r | r |

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **SPTYPE[1:0]**: stimulus port type support
0x1: only extended stimulus ports implemented

Bits 15:12 **DSIZE[3:0]**: fundamental data size
0x1: 64-bit data

Bit 11 Reserved, must be kept at reset value.

Bits 10:9 **SPTRTYPE[1:0]**: stimulus port transaction type support
0x2: both invariant timing and guaranteed transactions are supported

Bits 8:7 **PRIVMASK[1:0]**: STM_PRIVMASKR support
0x1: STM_PRIVMASKR is not implemented

Bit 6 **SPOVERRIDE**: STM_OVERRIDER support
1: STM_SPOVERRIDER and STM_SPMOVERRIDER are implemented

Bits 5:4 **SPCOMP[1:0]**: data compression on stimulus ports support
0x3: data compression support is programmable. Bit COMPEN of register STM_TCSR is implemented.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SPER**: STM_SPER presence
0: STM_SPER is implemented

Bits 1:0 **SPTER[1:0]**: STM_SPTER support
0x2: STM_SPTER is implemented

### STM features 3 register (STM_FEAT3R)

Address offset: 0xEA8

Reset value: 0x0000 007F

This register indicates the features of the STM in conjunction with registers STM_FEAT1R and STM_FEAT2R.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | NUMMAST[6:0] | | | | | | |
| | | | | | | | | | r | r | r | r | r | r | r |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **NUMMAST[6:0]**: number of stimulus ports masters implemented, minus 1
0x7F: 128 masters are implemented

### Integration test for cross-trigger outputs register (STM_ITTRIGGER)

Address offset: 0xEE8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ASYNCOUT_W | TRIGOUTHETE_W | TRIGOUTSW_W | TRIGOUTSPTE_W |
| | | | | | | | | | | | | w | w | w | w |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ASYNCOUT_W**: sets the value of the ASYNCOUT output in integration mode
1: drives logic 1 on ASYNCOUT output
0: drives logic 0 on ASYNCOUT output

Bit 2 **TRIGOUTHETE_W**: sets the value of the TRIGOUTHETE output in integration mode
1: drives logic 1 on TRIGOUTHETE output
0: drives logic 0 on TRIGOUTHETE output

Bit 1 **TRIGOUTSW_W**: sets the value of the TRIGOUTSW output in integration mode
1: drives logic 1 on TRIGOUTSW output
0: drive logic 0 on TRIGOUTSW output

Bit 0 **TRIGOUTSPTE_W**: sets the value of the TRIGOUTSPTE output in integration mode
1: drives logic 1 on TRIGOUTSPTE output
0: drives logic 0 on TRIGOUTSPTE output

### Integration mode ATB data 0 register (STM_ITATBDATA0)

Address offset: 0xEEC

Reset value: 0x0000 0000

This register controls the value of the ATDATAM output in integration mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | ATDATAM63_W | ATDATAM55_W | ATDATAM47_W | ATDATAM39_W | ATDATAM31_W | ATDATAM23_W | ATDATAM15_W | ATDATAM7_W | ATDATAM0_W |
| | | | | | | | w | w | w | w | w | w | w | w | w |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **ATDATAM63_W**: sets the value of the ATDATAM[63] output
1: drives logic 1 on ATDATAM[63] output
0: drives logic 0 on ATDATAM[63] output

Bit 7 **ATDATAM55_W**: sets the value of the ATDATAM[55] output
1: drives logic 1 on ATDATAM[55] output
0: drives logic 0 on ATDATAM[55] output

Bit 6 **ATDATAM47_W**: sets the value of the ATDATAM[47] output
1: drives logic 1 on ATDATAM[47] output
0: drives logic 0 on ATDATAM[47] output

Bit 5 **ATDATAM39_W**: sets the value of the ATDATAM[39] output
1: drives logic 1 on ATDATAM[39] output
0: drives logic 0 on ATDATAM[39] output

Bit 4 **ATDATAM31_W**: sets the value of the ATDATAM[31] output
1: drives logic 1 on ATDATAM[31] output
0: drives logic 0 on ATDATAM[31] output

Bit 3 **ATDATAM23_W**: sets the value of the ATDATAM[23] output
1: drives logic 1 on ATDATAM[23] output
0: drives logic 0 on ATDATAM[23] output

Bit 2 **ATDATAM15_W**: sets the value of the ATDATAM[15] output
1: drives logic 1 on ATDATAM[15] output
0: drives logic 0 on ATDATAM[15] output

Bit 1 **ATDATAM7_W**: sets the value of the ATDATAM[7] output
1: drives logic 1 on ATDATAM[7] output
0: drives logic 0 on ATDATAM[7] output

Bit 0 **ATDATAM0_W**: sets the value of the ATDATAM[0] output
1: drives logic 1 on ATDATAM[0] output
0: drives logic 0 on ATDATAM[0] output

### Integration mode ATB control 2 register (STM_ITATBCTR2)

Address offset: 0xEF0

Reset value: 0x0000 0000

This register returns the value of the ATREADYM and AFVALIDM inputs in integration mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | AFVALIDM_R | ATREADYM_R |
| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **AFVALIDM_R**: reads the value of the AFVALIDM input
1: pin is at logic 1
0: pin is at logic 0

Bit 0 **ATREADYM_R**: reads the value of the ATREADYM input
1: pin is at logic 1
0: pin is at logic 0

### Integration mode ATB identification register (STM_ITATBID)

Address offset: 0xEF4

Reset value: 0x0000 0000

This register controls the value of the ATIDM output in integration mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ATIDM_W[6:0] | | | | | | |
| | | | | | | | | | w | w | w | w | w | w | w |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **ATIDM_W[6:0]**: sets the value of the ATIDM output

### Integration mode ATB control 0 register (STM_ITATBCTR0)

Address offset: 0xEF8

Reset value: 0x0000 0000

This register controls the value of the ATVALIDM, AFREADYM, and ATBYTESM outputs in integration mode.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | ATBYTESM_W[2:0] | | | Res. | Res. | Res. | Res. | Res. | Res. | AFREADYM_W | ATVALIDM_W |
| | | | | | w | w | w | | | | | | | w | w |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **ATBYTESM_W[2:0]**: sets the value of the ATBYTESM output
0x7: drives logic 111 on the ATBYTESM output
0x6: drives logic 110 on the ATBYTESM output
0x5: drives logic 101 on the ATBYTESM output
0x4: drives logic 100 on the ATBYTESM output
0x3: drives logic 11 on the ATBYTESM output
0x2: drives logic 10 on the ATBYTESM output
0x1: drives logic 01 on the ATBYTESM output
0x0: drives logic 00 on the ATBYTESM output

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **AFREADYM_W**: sets the value of the AFREADYM output
1: drives logic 1 on the AFREADYM output
0: drives logic 0 on the AFREADYM output

Bit 0 **ATVALIDM_W**: sets the value of the ATVALIDM output
1: drives logic 1 on the ATVALIDM output
0: drives logic 0 on the ATVALIDM output

### Integration mode control register (STM_ITCTRL)

Address offset: 0xF00

Reset value: 0x0000 0000

This register is used to enable topology detection. Refer to *CoreSight™ Architecture Specification* for more information. This register enables the component to switch between functional mode and integration mode. The default behavior is functional mode. In integration mode the inputs and outputs of the STM can be directly controlled for integration testing and topology solving.

*Note: When a device has been in integration mode, it might not function with the original behavior. After performing integration or topology detection, the system must be reset to ensure correct behavior of CoreSight™ and other connected system components that are affected by the integration or topology detection.*

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **IME**: component mode switch enable

Enables the component to switch between functional mode and integration mode.

1: enables integration mode

0: disables integration mode

### Claim tag set register (STM_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

This register is used in conjunction with the Claim Tag Clear register (STM_CLAIMCLR). This register forms one half of the claim tag value. This location allows individual bits to be set (write) and returns the number of bits that can be set (read).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **SET[3:0]**: claim tag bit implementation

0xF: claim tag bits are present within the claim tag field

### Claim tag clear register (STM_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

This register is used in conjunction with the Claim Tag Set register (STM_CLAIMSET). This register forms one half of the claim tag value. This location enables individual bits to be cleared (write) and returns the current claim tag value (read).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| KEY[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **KEY[31:0]**: device register write access enable

A write of 0xC5ACCE55 enables further write access to the device. An invalid write has the effect of removing write access.

0xC5ACCE55: unlocks the protection register to enable write access

### Lock status register (STM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

This register indicates the status of the lock control mechanism that prevents accidental writes by the code under debug. The lock mechanism does not impact accesses to the extended stimulus port registers. This register is needed even in the absence of any lock access control mechanism. Where it is present and locked, the lock mechanism blocks the write accesses to any register but the STM_LAR. The lock mechanism is only present for accesses with PADDRDBG31 signal low.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | NTT | SLK | SLI |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **NTT**: STM_LAR size indicator
Indicates if the STM implements the STM_LAR as 8-bit or 32-bit.
0: 32-bit

Bit 1 **SLK**: lock current status
0: enables write access to the STM. For read accesses to the STM_LSR when the PADDRDBG31 signal is high, this bit is always 0.
1: blocks write access to the STM. The STM ignores all write accesses to the registers when the PADDRDBG31 signal is low. Reads are permitted.

Bit 0 **SLI**: lock control mechanism existence
Indicates that a lock control mechanism exists for this device.
0: no lock control mechanism exists. The STM ignores writes to the STM_LAR. For read accesses to the STM_LSR when the PADDRDBG31 signal is high, this bit is always 0.
1: lock control mechanism is present. For read accesses to the STM_LSR when the PADDRDBG31 signal is low, this bit is always 1.

### Authentication status register (STM_AUTHSTATUS)

Address offset: 0xFB8

Reset value: 0x0000 00AA

This register reports the required security level and current status of the authentication interface.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug
0x2: disabled
0x3: enabled

Bits 5:4 **SID[1:0]**: security level for secure invasive debug
0x2: disabled
0x3: enabled

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug
0x2: disabled
0x3: enabled

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug
0x2: disabled
0x3: enabled

### Device architecture register (STM_DEVARCH)

Address offset: 0xFBC

Reset value: 0x4771 0A63

This register indicates the architect and architecture of the STM. For the STM-500, the architect is Arm®, and the architecture is STMv1.1.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ARCHITECT[10:0] | | | | | | | | | | | PRESENT | REVISION[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | ARCHID[14:0] | | | | | | | | | | | | | | |
| | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:21 **ARCHITECT[10:0]**: component architect

Defines the architect of the component. Bits[31:28] indicate the DEP106 continuation code of the architect. Bits[27:21] indicate the JEP106 identification code of the architect. Refer to the Standard Manufacturers Identification Code for information about JEP106.

0x23B: the architect of the STM-500 is Arm®

Bit 20 **PRESENT**: STM_DEVARCH register presence

1: the STM_DEVARCH register is present

Bits 19:16 **REVISION[3:0]**: architecture revision

Returns the revision of the architecture that the ARCHID field specifies. For the STM-500, this value is 0x1, indicating the STMv1.1 architecture.

0x1: STMv1.1 architecture

Bit 15 Reserved, must be kept at reset value.

Bits 14:0 **ARCHID[14:0]**: architecture ID

Returns a value that identifies the architecture of the component. For the STM-500, this value is 0x0A63, indicating the STMv1 architecture.

0x0A63: STMv1 architecture

### Device configuration register (STM_DEVID)

Address offset: 0xFC8

Reset value: 0x0001 0000

This register indicates the capabilities of the CoreSight™ STM.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| NUMSP[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **NUMSP[16:0]**: number of stimulus ports implemented

0x10000: 65 536 stimulus ports are implemented

### Device type identifier register (STM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0063

This register provides a debugger with component information when the part number is not recognized. The debugger can then report this information.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SUB[3:0] | | | | MAJOR[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUB[3:0]**: sub-classification within the major category

0x6: CoreSight™ STM. The component generates trace based on software and hardware stimulus.

Bits 3:0 **MAJOR[3:0]**: major classification for debug or trace component

0x3: the component is a trace source

### Peripheral ID4 register (STM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

This register belongs to the set of peripheral identification registers. It contains part of the designer identity and the memory footprint indicator.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SIZE[3:0] | | | | DES_2[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: component memory size indicator

Indicates the total contiguous size of the memory window used by the component in powers of two from the standard 4 Kbytes. If a component only requires the standard 4 Kbytes, this bit field must read as 0x0. For 8 Kbytes it is set to 0x1. For 16 Kbytes it set to 0x2. For 32 Kbytes it is set to 0x3, and similarly for larger memory windows.

0x0: the device only occupies 4 Kbytes of memory

Bits 3:0 **DES_2[3:0]**: JEDEC continuation code

Indicates the designer of the component, together with the identity code.

0x4: indicates that Arm® JEDEC identity code is on the 5th bank

### Peripheral ID0 register (STM_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0063 (0x0000 00FF)

This register belongs to the set of peripheral identification registers. It contains part of the designer specific part number.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PART_0[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PART_0[7:0]**: bits [7:0] of the component part number
This field is specified by the designer of the component.
0x63: CoreSight™ STM Part Number[7:0]. Eight least significant bits of the part number (0x963).

### Peripheral ID1 register (STM_PIDR1)

Address offset: 0xFE4

Reset value: 0x0000 00B9

This register belongs to the set of peripheral identification registers. It contains part of the designer specific part number and part of the designer identity.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DES_0[3:0] | | | | PART_1[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **DES_0[3:0]**: bits [3:0] of the JEDEC identity code
Indicates the designer of the component, together with the continuation code.
0xB: least significant four bits of the JEP106 identity code.

Bits 3:0 **PART_1[3:0]**: bits [11:8] of the component part number
Specified by the designer of the component.
0x9: CoreSight™ STM part number[11:8]. Most significant four bits of the part number (0x963).

### Peripheral ID2 register (STM_PIDR2)

Address offset: 0xFE8

Reset value: 0x0000 001B

This register belongs to the set of peripheral identification registers. It contains part of the designer identity and the product revision.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | REVISION[3:0] | | | | JEDEC | DES_1[2:0] | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVISION[3:0]**: incremental component design version

An incremental value starting from 0x0 for the first design of this component. The value increases by one at both major and minor revisions and is used as a look-up to establish the exact major and minor revisions.

0x1: this device is at r0p1.

Bit 3 **JEDEC**: JEDEC assigned value usage

Indicates the use of a JEDEC assigned value. This bit is always set.

1: the designer ID is specified by JEDEC (refer to http://www.jedec.org)

Bits 2:0 **DES_1[2:0]**: bits [6:4] of the JEDEC identity code

Indicates the designer of the component, together with the continuation code.

0x3: most significant three bits of the JEP106 identity code

### Peripheral ID3 register (STM_PIDR3)

Address offset: 0xFEC

Reset value: 0x0000 0000

This register belongs to the set of peripheral identification registers. It contains the RevAnd and Customer_Modified bit fields.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | REVAND[3:0] | | | | CMOD[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVAND[3:0]**: minor fix indicator

Indicates minor errata fixes specific to the design, for example metal fixes after implementation. In most cases this field is 0x0. Arm® recommends that the component designers ensure that the bit field can be changed by a metal fix if required, for example by driving the bit field from registers that reset to zero.

0x0: no metal fix in the component

Bits 3:0 **CMOD[3:0]**: customer modification indicator

When the component is a reusable IP, this value indicates if the customer has modified the behavior of the component. In most cases this field is 0x0.

0x0: no modification made

### Component ID0 register (STM_CIDR0)

Address offset: 0xFF0

Reset value: 0x0000 000D

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PRMBL_0[7:0]**: bits [31:24] of component identification
Component identification register, that indicates that the identification registers are present.
0x0D: identification value

### Component ID1 register (STM_CIDR1)

Address offset: 0xFF4

Reset value: 0x0000 0090

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CLASS[3:0]**: component class
Indicates the class of the component, for example, ROM table or CoreSight™ component.
0x9: indicates that the component is a CoreSight™ component

Bits 3:0 **PRMBL_1[3:0]**: bits [19:16] of component identification.
Component identification register, that indicates that the identification registers are present.
0x0: identification value

### Component ID2 register (STM_CIDR2)

Address offset: 0xFF8

Reset value: 0x0000 0005

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PRMBL_2[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PRMBL_2[7:0]**: bits [15:8] of component identification
Component identification register, that indicates that the identification registers are present.
0x05: identification value

### Component ID3 register (STM_CIDR3)

Address offset: 0xFFC

Reset value: 0x0000 00B1

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

## 66.10.9 Microprocessor debug unit (DBGMCU)

The DBGMCU is a component containing a number of registers which control the power and clock behavior in debug mode. Specifically it allows the debugger, or debug software, to:

- maintain the clock and power to the processors when in low power modes (Sleep, Stop or Standby)
- maintain the clock and power to the system debug and trace components when in low power modes
- stop the clock to certain peripherals (CAN, SMBUS timeout, Watchdogs, Timers, RTC) when either processor is stopped in debug mode

### Low power mode emulation in debug

When entering a low power mode (CSleep, Stop, LP-Stop, LPLV-Stop or Standby), the clock to the processor, the subsystem clocks or, in the case of Standby mode, the core power

supply may be switched off. This prevents any debug accesses to the unclocked domains. To simplify debugging of applications which use these power saving features, the clock and power can be maintained or not according to the setting of the DBGSTBY, DBGSTOP and DBGSLEEP bits in the DBGMCU_CR register. These bits can be accessed directly by the debugger or by debug software, meaning that the application software does not need to be modified.

If the system enters one of the power saving modes, and the corresponding register bit is set, the system enters and exits the low power state as normal. However the clock and power remain active, allowing the debugger full access.

*Note: If the trace port interface (TPIU) is used, loss of trace data can occur if the system goes into Standby mode and switches off the core power before the TPIU FIFO is empty. The software can check the state of the FIFO to avoid this. However if the DBGSTBY bit is set while using the trace port, the trace continues to flush during Standby mode and no specific software action is required.*

### Peripheral clock “freeze” in debug

When one or more processors are halted in debug state, by default the peripherals continue to operate. This means that the system state at the moment the breakpoint was taken is overwritten and can not be recovered. Furthermore, certain peripherals require software intervention on a regular basis, without which they may time out and generate a reset (watchdogs, for example).

By setting the corresponding bits in the DBGMCU Peripheral Freeze registers, certain peripheral clocks can be stopped automatically as soon as one or both processors enter debug state. The clocks remain stopped until the processor is restarted.

The following peripherals support this feature:

- All timers (TIMn, LPTIMn)
- All I2C peripherals (to prevent SMBus timeout)
- FDCAN
- All watchdog timers (WWDG, IWDGn)
- Real time clock (RTC)

There is a pair of freeze registers for each peripheral bus (APB), to control the peripherals on that bus. One register of each pair controls whether the peripheral is sensitive to the Cortex®-A7 debug state, the other to the Cortex®-M4. It is recommended to use the register that corresponds to the processor responsible for rearming the peripheral timeout.

The Cortex®-M4 debug state corresponds to a high level on the M4 core **HALTED** signal (**HALTED** remains asserted while the core is in debug). That of the Cortex®-A7 is an OR of the **DBGACK** signal from each core (the core asserts **DBGACK** to indicate that the system has entered debug state). Hence if either CA7 core enters debug and the corresponding bit in the Peripheral Freeze register is set, then the peripheral clock will be frozen.

The IWDG1 (secure watchdog for the CA7) is an exception to the above. When secure debugging is disabled (**spiden** = 0), any CPU core which is in secure state will not stop in debug mode until it exits secure state. For security reasons, when **spiden** = 0, the IWDG1 timer will not stop unless DBGACK signal is active for both CPU cores, meaning both cores have stopped and hence both cores are in non-secure state. When secure debugging is enabled (**spiden** = 1), the behavior is determined by the WDFZCTL bit in the DBGMCU_CR register.

The IWDG1 behavior is summarized in truth *Table 574*.

**Table 574. IWDG1 behavior in debug**

| Inputs | | | | | IWDG1 frozen? |
|---|---|---|---|---|---|
| DBGMCU_APB5FZ1 .IWDG1 | spiden | DBGMCU_CR .WDFZCTL | DEBUGACK (CA7-0) | DEBUGACK (CA7-1) | |
| 0 | X | X | X | X | N |
| 1 | 0 | X | 0 | X | N |
| 1 | 0 | X | X | 0 | N |
| 1 | 0 | X | 1 | 1 | Y |
| 1 | 1 | 0 | 0 | 0 | N |
| 1 | 1 | 0 | 1 | X | Y |
| 1 | 1 | 0 | X | 1 | Y |
| 1 | 1 | 1 | 0 | X | N |
| 1 | 1 | 1 | X | 0 | N |
| 1 | 1 | 1 | 1 | 1 | Y |

### Microprocessor debug unit registers

The DBGMCU registers are not reset by a system reset **nreset**, only by a power on reset **vcore_rst**, by the debugger using CDBGRSTREQ/ACK, or by dbg_rstn which is set by writing to the bit DBGRST of RCC Debug Configuration register (RCC_DBGCFGR). They are accessible to the debugger via the debug APB bus at base address 0xE0081000. They are also accessible by both processors at base address 0x50081000

*Note: The DBGMCU is not a standard CoreSight™ component and so does not appear in the system ROM table.*

### DBGMCU identity code register (DBGMCU_IDC)

Address offset: 0x000

Reset value: 0x2000 6500

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 **REV_ID[15:0]**: revision
0x2000 = Rev. B

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DEV_ID[11:0]**: device ID
0x500: STM32MP15

### DBGMCU configuration register (DBGMCU_CR)

Address offset: 0x004

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | TRGOEN | Res. | Res. | Res. | WDFZCTL | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | rw | | | | rw | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DBGSTBY | DBGSTOP | DBGSLEEP |
| | | | | | | | | | | | | | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **TRGOEN:** external trigger output enable

This bit controls the direction of the DBTRGIO bi-directional trigger pin.

0: input. DBTRGIO is connected to DBTRGI

1: output. DBTRGIO is connected to DBTRGO

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **WDFZCTL:** IWDG1 secure debug behavior

This bit determines the behavior of the IWDG1 in debug mode when **spiden** = 1. Refer to *Table 574: IWDG1 behavior in debug* for details.

0: OR. Freeze watchdog timer when either CA7 core halts in debug mode

1: AND. Freeze watchdog timer only when both CA7 cores halt in debug mode

Bits 23:3 Reserved, must be kept at reset value.

Bit 2 **DBGSTBY:** Standby mode debug enable

0: normal operation. All clocks are disabled and the $V_{DDCORE}$ domain powered down automatically in Standby mode.

1: automatic clock stop/power down disabled. All active clocks and oscillators continue to run during Standby mode, and the $V_{DDCORE}$ domain supply is maintained, allowing full debug capability. On exit from Standby mode, a system reset is performed.

Bit 1 **DBGSTOP:** Stop mode debug enable

0: normal operation. In Stop or CStop mode, clocks may be stopped.

1: automatic clock stop disabled. All active clocks and oscillators continue to run during Stop, LP-Stop or CStop mode, allowing full debug capability. On exit from low-power mode, the clock settings are set to the normal low-power mode exit state.

Bit 0 **DBGSLEEP:** Sleep mode debug enable

0: normal operation. Processor clock is stopped automatically in CSleep mode.

1: automatic clock stop disabled. Processor clock continues to run, allowing full debug capability.

*Note: this bit only affects the Cortex®-M4, the Cortex®-A7 debug clock continues to run even when the core clocks are stopped (PxSTOP mode).*

### DBGMCU APB4 peripheral freeze register MPU (DBGMCU_APB4FZ1)

Address offset: 0x02C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG2**: IWDG2 stop in debug

0: normal operation. IWDG2 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. IWDG2 is frozen while either Cortex®-A7 core is in debug mode. No accesses are allowed on its APB interface.

Bits 1:0 Reserved, must be kept at reset value.

### DBGMCU APB1 peripheral freeze register MPU (DBGMCU_APB1FZ1)

Address offset: 0x034

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **I2C5**: I2C5 SMBUS timeout stop in debug

0: normal operation. I2C5 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. I2C5 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bit 20 **I2C3**: I2C3 SMBUS timeout stop in debug

0: normal operation. I2C3 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. I2C3 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bit 19 **I2C2**: I2C2 SMBUS timeout stop in debug

0: normal operation. I2C2 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. I2C2 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bit 18 **I2C1**: I2C1 SMBUS timeout stop in debug

0: normal operation. I2C1 SMBUS timeout continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. I2C1 SMBUS timeout is frozen while either Cortex®-A7 core is in debug mode.

Bits 17:11 Reserved, must be kept at reset value.

Bit 10 **WWDG1**: WWDG1 stop in debug
0: normal operation. WWDG1 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. WWDG1 is frozen while either Cortex®-A7 core is in debug mode.

Bit 9 **LPTIM1**: LPTIM1 stop in debug
0: normal operation. LPTIM1 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. LPTIM1 is frozen while either Cortex®-A7 core is in debug mode.

Bit 8 **TIM14**: TIM14 stop in debug
0: normal operation. TIM14 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM14 is frozen while either Cortex®-A7 core is in debug mode.

Bit 7 **TIM13**: TIM13 stop in debug
0: normal operation. TIM13 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM13 is frozen while either Cortex®-A7 core is in debug mode.

Bit 6 **TIM12**: TIM12 stop in debug
0: normal operation. TIM12 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM12 is frozen while either Cortex®-A7 core is in debug mode.

Bit 5 **TIM7**: TIM7 stop in debug
0: normal operation. TIM7 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM7 is frozen while either Cortex®-A7 core is in debug mode.

Bit 4 **TIM6**: TIM6 stop in debug
0: normal operation. TIM6 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM6 is frozen while either Cortex®-A7 core is in debug mode.

Bit 3 **TIM5**: TIM5 stop in debug
0: normal operation. TIM5 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM5 is frozen while either Cortex®-A7 core is in debug mode.

Bit 2 **TIM4**: TIM4 stop in debug
0: normal operation. TIM4 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM4 is frozen while either Cortex®-A7 core is in debug mode.

Bit 1 **TIM3**: TIM3 stop in debug
0: normal operation. TIM3 continues to operate while Cortex®-A7 is in debug mode.
1: stop in debug. TIM3 is frozen while either Cortex®-A7 core is in debug mode.

Bit 0 **TIM2**: TIM2 stop in debug
0: Normal operation. TIM2 continues to operate while Cortex®-A7 is in debug mode.
1: Stop in debug. TIM2 is frozen while either Cortex®-A7 core is in debug mode.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **I2C5**: I2C5 SMBUS timeout stop in debug
0: normal operation. I2C5 SMBUS timeout continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. I2C5 SMBUS timeout is frozen while Cortex®-M4 is in debug mode.

Bit 20 **I2C3**: I2C3 SMBUS timeout stop in debug
0: normal operation. I2C3 SMBUS timeout continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. I2C3 SMBUS timeout **i**s frozen while Cortex®-M4 is in debug mode.

Bit 19 **I2C2**: I2C2 SMBUS timeout stop in debug
0: normal operation. I2C2 SMBUS timeout continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. I2C2 SMBUS timeout **i**s frozen while Cortex®-M4 is in debug mode.

Bit 18 **I2C1**: I2C1 SMBUS timeout stop in debug
0: normal operation. I2C1 SMBUS timeout continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. I2C1 SMBUS timeout **i**s frozen while Cortex®-M4 is in debug mode.

Bits 17:11 Reserved, must be kept at reset value.

Bit 10 **WWDG1**: WWDG1 stop in debug
0: normal operation. WWDG1 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. WWDG1 is frozen while Cortex®-M4 is in debug mode.

Bit 9 **LPTIM1**: LPTIM1 stop in debug
0: normal operation. LPTIM1 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. LPTIM1 **i**s frozen while Cortex®-M4 is in debug mode.

Bit 8 **TIM14**: TIM14 stop in debug
0: normal operation. TIM14 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM14 **i**s frozen while Cortex®-M4 is in debug mode.

Bit 7 **TIM13**: TIM13 stop in debug
0: normal operation. TIM13 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM13 is frozen while Cortex®-M4 is in debug mode.

Bit 6 **TIM12**: TIM12 stop in debug
0: normal operation. TIM12 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM12 is frozen while Cortex®-M4 is in debug mode.

Bit 5 **TIM7**: TIM7 stop in debug
0: normal operation. TIM7 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM7 is frozen while Cortex®-M4 is in debug mode.

Bit 4 **TIM6**: TIM6 stop in debug
0: normal operation. TIM6 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM6 is frozen while Cortex®-M4 is in debug mode.

Bit 3 **TIM5**: TIM5 stop in debug
0: normal operation. TIM5 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM5 is frozen while Cortex®-M4 is in debug mode.

Bit 2 **TIM4**: TIM4 stop in debug
0: normal operation. TIM4 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM4 is frozen while Cortex®-M4 is in debug mode.

Bit 1 **TIM3**: TIM3 stop in debug
0: normal operation. TIM3 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM3 is frozen while Cortex®-M4 is in debug mode.

Bit 0 **TIM2**: TIM2 stop in debug
0: normal operation. TIM2 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM2 is frozen while Cortex®-M4 is in debug mode.

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **FDCAN**: FDCAN stop in debug
0: normal operation. FDCAN continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. FDCAN is frozen while Cortex®-M4 is in debug mode.

Bits 14:9 Reserved, must be kept at reset value.

Bit 8 **TIM17**: TIM17 stop in debug
0: normal operation. TIM17 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM17 is frozen while Cortex®-M4 is in debug mode.

Bit 7 **TIM16**: TIM16 stop in debug
0: normal operation. TIM16 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM16 is frozen while Cortex®-M4 is in debug mode.

Bit 6 **TIM15**: TIM15 stop in debug
0: normal operation. TIM15 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM15 is frozen while Cortex®-M4 is in debug mode.

Bits 5:2 Reserved, must be kept at reset value.

Bit 1 **TIM8**: TIM8 stop in debug
0: normal operation. TIM8 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM8 is frozen while Cortex®-M4 is in debug mode.

Bit 0 **TIM1**: TIM1 stop in debug
0: normal operation. TIM1 continues to operate while Cortex®-M4 is in debug mode.
1: stop in debug. TIM1 is frozen while Cortex®-M4 is in debug mode.

## 66.11 Cortex®-A7 debug features

The Cortex®-A7 subsystem integrates the following CoreSight™ components, one of each per core:

- Debug unit (DBG)
- Performance Monitoring Unit (PMU)
- Embedded Trace Macrocell (ETM)
- Cross Trigger Interface (CTI)

These components are accessible by the debugger via the APB-AP and its associated debug APB bus. They are also accessible by both Cortex®-A7 and Cortex®-M4 via the system interconnect.

### 66.11.1 Cortex®-A7 debug unit

The debug unit enables the debugger to access the debug features buit into the Cortex®-A7 MPCore. The debug features allow an external debugger to:

- Stop program execution
- Examine and alter process and coprocessor state
- Examine and alter memory and input/output peripheral state
- Restart the processor

For detailed information on the debug unit, refer to the *Cortex®-A7 MPCore Technical Reference Manual* [9].

#### Debug unit registers

The debug unit comprises a number of registers accessible to the debugger via the debug APB at address range 0xE00D 0000 to 0xE00D 0FFC for CA7-CPU1, and 0xE00D 2000 to 0xE00D 2FFC for CA7-CPU2. The same registers are accessible to software at address range 0x500D 0000 to 0x500D 0FFC for CA7-CPU1, and 0x500D 2000 to 0x500D 2FFC for CA7-CPU2.

Each Cortex®-A7 core can access certain of its own debug unit registers via the CP14 (baseline and extended) registers, using MCR, MRC, MCCR and MRRC instructions.

### Debug identification register (DBG_DIDR)

Address offset: 0x000

Reset value: 0x3515 F005

Specifies which version of debug architecture is implemented and what features.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| WRPS[3:0] | | | | BRPS[3:0] | | | | CTX_CMPS[3:0] | | | | VERSION[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

| r | r | r | r | | | | | r | r | r | r | r | r | r | r |

Bits 31:28 **WRPS[3:0]**: Watchpoint Registers Pairs.
Indicates the number of watchpoint register pairs implemented.
0x3: The processor implements 4 WRPs

Bits 27:24 **BRPS[3:0]**: Breakpoint Registers Pairs.
Indicates the number of breakpoint register pairs implemented.
0x5: The processor implements 6 BRPs

Bits 23:20 **CTX_CMPS[3:0]**: Context ID comparators.
Indicates the number of BRPs that can be used for Context ID comparison.
0x1: The processor implements 2 breakpoints with context ID comparison

Bits 19:16 **VERSION[3:0]**: Debug Architecture version.
0x5: Arm®v7.1 debug architecture

Bit 15 **DEVIDIMP**: Debug Device ID register (DBGDEVID) implemented.
1: Implemented

Bit 14 **NSUHDIMP**: Secure User Halting Debug implemented.
1: Not implemented

Bit 13 **PCSRIMP**: Program Counter Sampling Register (DBGPCSR) implemented as register 33.
1: Implemented

Bit 12 **SEIMP**: Security Extensions implemented.
1: Implemented

Bits 11:8 Reserved, must be kept at reset value.

Bits 7:4 **VARIANT[3:0]**: Processor Variant number.
This number is incremented on functional changes. This field matches bits [23:20] of the CP15 Main ID register.
0x0: Variant = 0

Bits 3:0 **REVISION[3:0]**: Processor Revision number.
This number is incremented on bug fixes. This field matches bits [3:0] of the CP15 Main ID register.
0x5: Revision = 5

### Debug watchpoint fault address register (DBG_WFAR)

Address offset: 0x018

Reset value: 0x0000 0000

Returns information about the address of the instruction that accessed a watchpointed address. Not used in this version of debug architecture.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### Debug event catch register (DBG_ECR)

Address offset: 0x024

Reset value: 0x0000 0000

Configures the debug logic to generate the OS Unlock catch debug event when the OS Lock is cleared.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **OSUCE**: OS Unlock Catch enable.

An OS Unlock catch debug event is generated when the OS Lock is cleared by writing to the DBGOSLAR.

0: Disabled

1: Enabled

### Debug host to target data transfer register (DBG_DTRRX)

Address offset: 0x080

Reset value: 0x0000 0000

Transfers data from an external host to the Arm® processor. For example it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communication Channel (DCC).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: Host to Target Data.

One word of data for transfer from the debug host to the debug target.

### Debug instruction transfer register (DBG_ITR)

Address offset: 0x084

Reset value: 0x0000 0000

When the processor is in Debug state, transfers an Arm® instruction to the processor for execution.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| INSTRUCTION[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| INSTRUCTION[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **INSTRUCTION[31:0]**: Instruction.

32-bit encoded Arm® instruction to execute on the processor

### Debug status and control register (DBG_DSCR)

Address offset: 0x088

Reset value: 0x0000 0000

The main control register for debug.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | RXFULL | TXFULL | Res. | RXFULL_L | TXFULL_L | PIPEADV | INSTRCOMPL_L | Res. | Res. | EXTDCCMODE[1:0] | | ADADISCARD | NS | SPNIDDIS | SPIDDIS |
| | rw | rw | | rw | rw | rw | rw | | | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MDBGEN | HDBGEN | ITREN | UDCCDIS | INTDIS | DBGACK | FS | UND_L | ADABORT_L | SDABORT_L | MOE[3:0] | | | | RESTARTED | HALTED |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 Reserved, must be kept at reset value.

Bit 30 **RXFULL**: DBGDTRRX register full.

0: Register empty

1: Register full

Bit 29 **TXFULL**: DBGDTRTX register full.

0: Register empty

1: Register full

Bit 28 Reserved, must be kept at reset value.

Bit 27 **RXFULL_L**: Latched RXfull.

This controls the behavior of the processor on writes to DBGDTRRX in non-blocking mode (DBGDSCR.EXTDCCMODE = 0x0)

0: Writes to DBGDTRRX execute and set the RXFULL and RXFULL_L bits to 1

1: Writes to DBGDTRRX are ignored

Bit 26 **TXFULL_L**: Latched TXfull.

This controls the behavior of the processor on reads to DBGDTRTX in non-blocking mode (DBGDSCR.EXTDCCMODE = 0x0)

0: Reads to DBGDTRTX return an undefined value

1: Reads to DBGDTRTX return the register contents and reset the TXFULL and TXFULL_L bits to 0

Bit 25 **PIPEADV**: Sticky Pipeline Advance (Read only).

This bit is set to 1 whenever the processor pipeline advances by retiring one or more instructions. It is cleared to 0 only by a write to DBGDRCR.CSPA. This bit enables a debugger to detect that the processor is idle. In some situations this might indicate that the processor is deadlocked.

Bit 24 **INSTRCOMPL_L**: Latched Instruction Complete (Read Only).

This is a copy of the internal InstrCompl flag, taken on each read of DBGDSCR InstrCompl signals whether the processor has completed execution of an instruction issued through DBGITR. InstrCompl is not visible directly in any register. On a read of DBGDSCR when the processor is in Debug state, InstrCompl_l always returns the current value of InstrCompl. The meanings of the values of InstrCompl_l are:

0: An instruction previously issued through the DBGITR has not completed its changes to the architectural state of the processor.

1: All instructions previously issued through the DBGITR have completed their changes to the architectural state of the processor.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **EXTDCCMODE[1:0]**: External DCC Access Mode.
This field controls the access mode for the DCC registers and the DBG_ITR.
0x0: Non-blocking mode. Accesses always complete without stalling the bus.
0x1: Stall mode. Accesses stall the bus until they can complete successfully.
0x2: Fast mode. Allows an instruction to be latched in the DBG_ITR and executed repeatedly by successive read accesses to DBG_DTRTX, or write accesses to DBG_DTRRX
0x3: Reserved

Bit 19 **ADADISCARD**: Asynchronous Aborts Discarded.
0: Asynchronous aborts handled normally
1: On an asynchronous abort to which this bit applies, the processor sets the Sticky Asynchronous Abort bit, ADABORT_L, to 1 but otherwise discards the abort.

Bit 18 **NS**: Non-Secure state status (Read Only).
0: Processor is in Secure state
1: Processor is in Non-Secure state

Bit 17 **SPNIDDIS**: Secure PL1 Non-Invasive Debug Disabled (Read Only).
This bit shows if non-invasive debug is permitted in Secure PL1 modes.
0: Non-invasive debug permitted in Secure PL1 modes
1: Non-invasive debug not permitted in Secure PL1 modes

Bit 16 **SPIDDIS**: Secure PL1 Invasive Debug Disabled (Read Only).
This bit shows if invasive debug is permitted in Secure PL1 modes.
0: Invasive debug permitted in Secure PL1 modes
1: Invasive debug not permitted in Secure PL1 modes

Bit 15 **MDBGEN**: Monitor Debug mode enable.
0: Monitor debug mode disabled
1: Monitor debug mode enabled

Bit 14 **HDBGEN**: Halting Debug mode enable.
0: Halting debug mode disabled
1: Halting debug mode enabled

Bit 13 **ITREN**: Enable Arm® instruction execution.
This bit enables the execution of Arm® instructions through the DBGITR. This bit should always be written low when the processor is not in debug state.
0: ITR mechanism disabled
1: ITR mechanism enabled

Bit 12 **UDCCDIS**: User mode access to Debug Communications Channel (DCC) disable.
0: DCC access in User mode enabled
1: User mode acces to any DCC register via CP14 will generate an undefined instruction exception

Bit 11 **INTDIS**: Interrupt disable.
0: FIQ and IRQ enabled
1: FIG and IRQ masked

Bit 10 **DBGACK**: Force Debug Acknowledge.
This allows the debugger to simulate debug mode entry via the cross-trigger while the core remains in non-debug mode.
0: Normal operation
1: DBGACK asserted

Bit 9 **FS**: Fault Status (Read Only).

This bit is updated when a data abort exception is generated in debug state. It indicates where the fault information is held.

0: Fault status information may be held in PL1 fault reporting registers (DFSR and DFAR) or PL2 fault syndrome registers (HSR, HDFAR) according to current state, mode and the HCR.TGE register value

1: Fault status information was written to the PL2 fault syndrome registers

Bit 8 **UND_L**: Sticky Undefined Instruction (Read Only).

This bit is set to 1 by any Undefined Instruction exceptions generated by instructions issued to the processor while in Debug state.

0: No Undefined Instruction exception has been generated since the last time this bit was cleared

1: An Undefined Instruction exception has been generated since the last time this bit was cleared

Bit 7 **ADABORT_L**: Sticky Asynchronous Abort (Read Only).

This bit is set to 1 by any asynchronous abort that occurs while in Debug state, if ADADISCARD bit is set to 1.

0: No Asynchronous Abort has been generated since the last time this bit was cleared

1: An Asynchronous Abort has been generated since the last time this bit was cleared

Bit 6 **SDABORT_L**: Sticky Synchronous Data Abort (Read Only).

This bit is set to 1 by any synchronous data abort exception generated while in Debug state.

0: No synchronous Data Abort has been generated since the last time this bit was cleared

1: A synchronous Data Abort has been generated since the last time this bit was cleared

Bits 5:2 **MOE[3:0]**: Method of Debug Entry (Read Only).

Indicates the debug event which caused the processor to enter into debug mode.

0x0: Halt request

0x1: Breakpoint

0x2: Asynchronous watchpoint

0x3: BKPT instruction

0x4: External debug request

0x5: Vector catch

0x6 to 0x7: Reserved

0x8: OS unlock catch

0x9: Reserved

0xA: Synchronous watchpoint

0xB to 0xF: Reserved

Bit 1 **RESTARTED**: Processor Restarted (Read Only).

After making a restart request, the debugger can poll this bit until it is set to 1. At that point it knows that the restart request has taken effect and the processor has exited Debug state.

0: The processor is exiting Debug state. This bit only reads as 0 between receiving a restart request, and restarting Non-debug state operation

1: The processor has exited Debug state. This bit remains set to 1 if the processor re-enters Debug state.

Bit 0 **HALTED**: Processor Halted (Read Only).

After programming a debug event, the external debugger can poll this bit until it is set to 1. At that point it knows that the processor has entered Debug state.

0: The processor is in Non-debug state

1: The processor is in Debug state

### Debug target to host data transfer register (DBG_DTRTX)

Address offset: 0x08C

Reset value: 0x0000 0000

Transfers data from the Arm® processor to an external host. For example it is used by a debug target to transfer commands and data to a debugger. It is a component of the Debug Communication Channel (DCC).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: Target to Host Data.
One word of data for transfer from the debug target to the debug host.

### Debug run control register (DBG_DRCR)

Address offset: 0x090

Reset value: 0x0000 0000

Software uses this register to request the processor to enter or exit Debug state, and to clear the sticky exception bits in the DBG_DSCR.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CBRRQ | CSPA | CSE | RRQ | HRQ |
| | | | | | | | | | | | rw | rw | rw | rw | rw |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CBRRQ**: Cancel Bus Requests.
0: No action
1: Request cancel of pending accesses

Bit 3 **CSPA**: Clear Sticky Pipeline Advance bit.
0: No action
1: Reset the DBG_DSCR.PIPEADV bit to 0

Bit 2 **CSE**: Clear Sticky Exception bits..
0: No action
1: Resets the DBG_DSCR[8:6] bits to 0

Bit 1 **RRQ**: Restart Request.
This request is held until the processor exits Debug state. After the request has been made, the debugger can poll the DBG_DSCR.RESTARTED bit until it reads as 1.
0: No action
1: Request exit from debug mode.

Bit 0 **HRQ**: Halt Request.
This request is held until the processor enters Debug state. After the request has been made, the debugger can poll the DBG_DSCR.HALTED bit until it reads as 1.
0: No action
1: Request entry from debug mode.

### Debug external auxiliary control register (DBG_EACR)

Address offset: 0x094

Reset value: 0x0000 0000

Provides implementation-defined configuration and control options.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CDRSTAT | Res. | Res. | Res. |
| | | | | | | | | | | | | r | | | |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **CDRSTAT**: Core Debug Reset Status (Read Only).
Reflects the current reset state of the debug logic in the CPU power domain.
0: Debug logic in CPU power domain is not in reset state
1: Debug logic in CPU power domain is in reset state

Bits 2:0 Reserved, must be kept at reset value.

### Debug program counter sampling register (DBG_PCSR)

Address offset: 0x0A0

Reset value: 0x0000 0000

This register provides implementation-defined configuration and control options.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PCS[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PCS[15:1] | | | | | | | | | | | | | | | T |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:1 **PCS[31:1]**: Program Counter Sample value.

The sampled value of bits[31:1] of the PC. The sampled value is either the virtual address of an instruction, or the virtual address of an instruction address plus an offset that depends on the processor instruction set state. DBG_DEVID1.PCSROFFSET indicates whether an offset is applied to the sampled addresses.

Bit 0 **T**: Thumb instruction.

This bit indicates whether the sampled address is an Arm® instruction, or a Thumb or ThumbEE instruction:

0: Arm® instruction

1: Thumb or ThumbEE instruction

### Debug context ID sampling register (DBG_CIDSR)

Address offset: 0x0A4

Reset value: 0x0000 0000

Samples the CONTEXTIDR whenever the DBG_PCSR samples the program counter. This enables a debugger to associate a program counter sample with the process running on the processor.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CONTEXTIDR[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CONTEXTIDR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **CONTEXTIDR[31:0]**: Context ID Register sample value.

The value of the Context ID Register, CONTEXTIDR, associated with the last PC sample read from DBG_PCSR.

### Debug virtualisation id sampling register (DBG_VIDSR)

Address offset: 0x0A8

Reset value: 0x0000 0000

Samples the VMID, Hyp mode status, and NS state whenever the DBGPCSR samples the program counter. This enables a debugger to associate a program counter sample with the virtual machine running on the processor.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| NS | H | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| r | r | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VMID[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **NS**: Sampled NS state.

Indicates the Secure or Non-secure state associated with the last PC sample read from DBGPCSR.

0: Secure state

1: Non-secure state

Bit 30 **H**: Sampled Hyp mode. Indicates whether the last PC sample read from DBG_PCSR was associated with Hyp mode.

0: Not Hyp mode

1: Hyp mode

Bits 29:8 Reserved, must be kept at reset value.

Bits 7:0 **VMID[7:0]**: VMID sample.

The value of the VMID field from the VTTBR, associated with the last PC sample read from DBG_PCSR.

### Debug breakpoint value x register (DBG_BVRx)

Address offset: 0x100 + 0x4 * x, (x = 0 to 5)

Reset value: 0x0000 0000

Holds a value for use in breakpoint matching, either an instruction address or a Context ID. Each DBG_BVR is associated with a DBG_BCR to form a Breakpoint Register Pair (BRP) ie. DBG_BVR[n] is associated with DBG_BCR[n] to form breakpoint n.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ADDRESSCONTEXTID[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ADDRESSCONTEXTID[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ADDRESSCONTEXTID[31:0]**: Instruction Address or Context ID.

If the register is being used for address comparison, this field contains the instruction address to be matched (bits 31:2; bits 1:0 must be set to zero). If the register is being used for context ID comparison, this field contains the Context ID to be matched.

### Debug breakpoint control x register (DBG_BCRx)

Address offset: 0x140 + 0x4 * x, (x = 0 to 5)

Reset value: 0x0000 0000

Holds control information for breakpointing. Each DBG_BCR is associated with a DBG_BVR to form a Breakpoint Register Pair (BRP) ie. DBG_BCR[n] is associated with DBG_BVR[n] to form breakpoint n.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BT[3:0] | | | | LBN[3:0] | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SSC[1:0] | | HMC | Res. | Res. | Res. | Res. | BAS[3:0] | | | | Res. | Res. | PMC[1:0] | | E |
| rw | rw | rw | | | | | rw | rw | rw | rw | | | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **BT[3:0]**: Breakpoint Type.

Determines the type of comparison made by the breakpoint.
0x0: Unlinked instruction address match
0x1: Linked instruction address match
0x2: Unlinked Context ID match
0x3: Linked Context ID match
0x4: Unlinked instruction address mismatch
0x5: Linked instruction address mismatch
0x6-0x7: Reserved
0x8: Unlinked VMID match
0x9: Linked VMID match
0xA: Unlinked VMID match and Context ID match
0xB: Linked VMID match and Context ID match
0xC-0xF: Reserved

Bits 19:16 **LBN[3:0]**: Linked Breakpoint Number.

If this breakpoint is programmed for Linked instruction address match or mismatch then this field must be programmed with the number of the breakpoint that holds the Context match to be used in the combined instruction address and Context comparison. Otherwise, this field must be programmed to 0.

Bits 15:14 **SSC[1:0]**: Security State Control.

This field enables the breakpoint to be conditional on the security state of the processor. This field must be programmed to 0 if DBG_BCR.BT is programmed for Linked Context ID match.
0: Secure and Non-secure state
1: Non-secure state only
2: Secure state only
3: Hyp mode only (with HMC=1 and PMC = 0)

Bit 13 **HMC**: Hyp Mode Control.

This field controls whether the breakpoint matches in Hyp mode.
This field must be programmed to 0 if DBG_BCR.BT is programmed for Linked Context ID match.
0: Breakpoint does not match in Hyp mode
1: Breakpoint can match in Hyp mode

Bits 12:9 Reserved, must be kept at reset value.

Bits 8:5 **BAS[3:0]**: Byte Address Select.
This field enables match or mismatch comparisons on only certain bytes of the word address held in the DBG_BVR. The operation of this field depends also on:
The breakpoint type field being programmed for instruction address match or mismatch.
The instruction set state of the processor, indicated by the CPSR.J and CPSR.T bits.
This field must be programmed to 0xF if the DBG_BVR.BT is programmed for Linked or Unlinked Context ID match.

Bits 4:3 Reserved, must be kept at reset value.

Bits 2:1 **PMC[1:0]**: Privileged Mode Control.
This field enables the breakpoint to be conditional on the mode of the processor. This field must be programmed to 3 if DBG_BCR.BT is programmed for Linked Context ID match.
0: PL0, Supervisor and System modes only
1: PL1 and PL2 modes only
2: PL0 mode only
3: All modes

Bit 0 **E**: Breakpoint Enable.
0: Breakpoint disabled
1: Breakpoint enabled

### Debug watchpoint value x register (DBG_WVRx)

Address offset: 0x180 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

Holds a value for use in Watchpoint matching, The address used must be the virtual address of the data. Each DBG_WVR is associated with a DBG_WCR to form a Breakpoint Register Pair (BRP) ie. DBG_WVR[n] is associated with DBG_WCR[n] to form breakpoint n.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ADDRESS[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ADDRESS[15:2] | | | | | | | | | | | | | | Res. | Res. |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | |

Bits 31:2 **ADDRESS[31:2]**: Data Address.
This field indicates bits[31:2] of the address value for comparison.

Bits 1:0 Reserved, must be kept at reset value.

### Debug watchpoint control xregister (DBG_WCRx)

Address offset: 0x1C0 + 0x4 * x (x=0 to 3)

Reset value: 0x0000 0000

Holds control information for watchpoint. Each DBG_WCR is associated with a DBG_WVR to form a Breakpoint Register Pair (BRP) ie. DBG_WCR[n] is associated with DBG_WVR[n] to form breakpoint n.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | MASK[4:0] | | | | | Res. | Res. | Res. | WT | LBN[3:0] | | | |
| | | | rw | rw | rw | rw | rw | | | | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SSC[1:0] | | HMC | BAS[7:0] | | | | | | | | LSC[1:0] | | PAC[1:0] | | E |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **MASK[4:0]**: Address Mask.

This field can be used to set a watchpoint on a range of addresses by masking lower order address bits out of the watchpoint comparison. The value of this field is the number of low order bits of the address that are masked off, except that values of 1 and 2 are reserved.

0x0: No mask

0x1: Reserved

0x2: Reserved

0x3: Three bits masked (data address mask = 0x00000007)

0x4: Four bits masked (data address mask = 0x0000000F)

0x5: Five bits masked (data address mask = 0x0000001F)

..

0x1F: 31 bits masked (data address mask = 0x7FFFFFFF)

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **WT**: Watchpoint Type.

This bit is set to 1 to link the watchpoint to a breakpoint to create a linked watchpoint that requires both data address matching and Context ID matching. The linked breakpoint number field indicates the breakpoint to which this watchpoint is linked.

0: Linking disabled.

1: Linking enabled.

Bits 19:16 **LBN[3:0]**: Linked Breakpoint Number.

If this watchpoint is programmed with watchpoint type set to linkink enabled, then this field must be programmed with the number of the breakpoint that defines the Context match to be combined with data address comparison. Otherwise, this field must be programmed to 0.

Bits 15:14 **SSC[1:0]**: Security State Control.

This field enables the watchpoint to be conditional on the security state of the processor.

0: Secure and Non-secure state

1: Non-secure state only

2: Secure state only

3: Hyp mode only (with HMC=1 and PAC = 0)

Bit 13 **HMC**: Hyp Mode Control.

This field controls whether the watchpoint matches in Hyp mode.

0: Watchpoint does not match in Hyp mode

1: Watchpoint can match in Hyp mode

Bits 12:5 **BAS[7:0]**: Byte Address Select.
A DBG_WVR is programmed with a word-aligned address. This field enables the watchpoint to hit only if certain bytes of the addressed word are accessed. The watchpoint hits if an access hits any byte being watched, even if:
The access size is larger than the size of the region being watched.
The access is unaligned, and the base address of the access is not in the same word of memory as the address in the DBG_WVR.
Watched bytes should be contiguous within a word ie. 11100001 should not be programmed.
Example values for BAS:
00000001: Watch byte 0
00000011: Watch bytes 1 and 0
00000010: Watch byte 1
00000111: Watch bytes 2, 1 and 0
11110000: Watch bytes 7,6,5 and 4
etc.

Bits 4:3 **LSC[1:0]**: Load/store access control.
This field enables watchpoint matching conditional on the type of access being made.
0: Reserved
1: Match on any Load, Load-Exclusive or Swap
2: Match on any Store, Store-Exclusive, or Swap
3: Match on either type of access

Bits 2:1 **PAC[1:0]**: Privileged Access Control.
This field enables watchpoint matching conditional on the mode of the processor.
0: PL0, Supervisor and System modes only
1: PL1 and PL2 modes only
2: PL0 mode only
3: All modes

Bit 0 **E**: Watchpoint Enable.
0: Watchpoint disabled
1: Watchpoint enabled

### Debug breakpoint extended value x register (DBG_BXVRx)

Address offset: 0x250 + 0x4 * x, (x = 0 to 1)

Reset value: 0x0000 0000

Holds a value for use in VMID matching for BRP that supports Context ID comparison. Each DBG_BXVR is associated with a DBG_BCR/DBG_BVR Breakpoint Register Pair (BRP) ie. DBG_BXVR[n] is associated with DBG_BCR[n] and DBG_BVR[n] to form breakpoint n.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VMID[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **VMID[7:0]**: Virtual Machine ID.
Used to compare with the Virtual Machine ID (VMID) field, held in the Virtualization Translation Table Base Register (VTTBR).

### Debug OS lock access register (DBG_OSLAR)

Address offset: 0x300

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| OSLOCKACCESS[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| OSLOCKACCESS[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **OSLOCKACCESS[31:0]**: DBG registers lock access
0xC5ACCE55: Disable access
Other values: Enable access

### Debug OS lock status register (DBG_OSLSR)

Address offset: 0x304

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OSLM [1] | NTT | OSLK | OSLM [0] |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bit 2 **NTT**: Need 32-bit.
0: 32-bit access is needed to write the key to the OS Lock Access Register.

Bit 1 **OSLK**: OS lock status
0: LOCK not set.
1: LOCK set. Access to DBG registers disabled

Bits 3, 0 **OSLM[1:0]**: OS lock model
This field identifies the form of OS Save and Restore mechanism implemented:
10: The processor implements the OS Lock Model but does not implement DBGOSSRR
Others: Reserved

### Debug device power-down and reset control register (DBG_PRCR)

Address offset: 0x310

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | COREPURQ | HCWR | CWRR | CORENPDRQ |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **COREPURQ**: Power-up request

This bit enables a debugger to request that the power controller powers up the processor, enabling access to debug registers in the processor power domain:
0: DBGPWRUPREQ is low
1: DBGPWRUPREQ is high

Bit 2 **HCWR**: Hold reset

0: Do not hold the non-debug logic reset on power-up or warm reset.
1: Hold the non-debug logic of the processor in reset on power-up or warm reset. The processor is held in this state until this bit is set to 0

Bit 1 **CWRR**: Reset request

0: No action
1: Request internal reset using the memory mapped interface or CP14

Bit 0 **CORENPDRQ**: Hold power-up request

0: DBGNOPWRDWN is low
1: DBGNOPWRDWN is high

### Debug device power-down and reset status register (DBG_PRSR)

Address offset: 0x314

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DLK | OSLK | HALTED | SR | R | SPD | PU |
| | | | | | | | | | r | r | r | r | r | r | r |

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **DLK**: OS double lock status
0: OS double lock not set
1: OS double lock set

Bit 5 **OSLK**: OS lock status
0: OS lock not set
1: OS lock set

Bit 4 **HALTED**: Halted state
0: Processor is in non-debug state
1: Processor is in debug state

Bit 3 **SR**: Sticky reset
0: The non-debug logic of the processor has not been reset since the last time this register was read.
1: The non-debug logic of the processor has been reset since the last time this register was read.

Bit 2 **R**: Reset
0: The non-debug logic is not currently held in reset
1: The non-debug logic is currently held in reset

Bit 1 **SPD**: Sticky power-down status
0: The core power domain has not powered down since the last time this register was read
1: The core power domain has powered down since the last time this register was read

Bit 0 **PU**: Power-up status
0: The core power domain is powered down
1: The core power domain is powered up

### Debug processor main ID register (DBG_MIDR)

Address offset: 0xD00

Reset value: 0x410F C075

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:24 **IMPLEMENTER[7:0]**: Implementer code
0x41: Arm® Limited

Bits 23:20 **VARIANT[3:0]**: Variant (major revision number)
0x0: r0pn

Bits 19:16 **ARCH[3:0]**: Architecture
0xF: Arm® v7

Bits 15:4 **PART[11:0]**: Primary part number
0xC07: Cortex-A7 MPCore

Bits 3:0 **REVISION[3:0]**: Revision (minor revision number)
0x5: rnp5

### Debug processor cache type register (DBG_CTR)

Address offset: 0xD04

Reset value: 0x8444 8003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FORMAT[2:0] | | | Res. | CWG[3:0] | | | | ERG[3:0] | | | | DMINLINE[3:0] | | | |
| r | r | r | | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| L1IP[1:0] | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | IMINLINE[3:0] | | | |
| r | r | | | | | | | | | | | r | r | r | r |

Bits 31:29 **FORMAT[2:0]**: CTR format
0x4: Arm®v7 format

Bit 28 Reserved, must be kept at reset value.

Bits 27:24 **CWG[3:0]**: Cache write-back granule
Number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.
0x4: 16 words

Bits 23:20 **ERG[3:0]**: Exclusives reservation granule.
Number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.
0x4: 16 words

Bits 19:16 **DMINLINE[3:0]**: Minimum data cache line.
Number of words in the smallest cache line of all the data and unified caches that the processor controls.
0x4: 16 words

Bits 15:14 **L1IP[1:0]**: L1 instruction cache policy
Indicates the indexing and tagging policy for the L1 instruction cache.
0x2: Virtually Indexed Physically Tagged (VIPT)

Bits 13:4 Reserved, must be kept at reset value.

Bits 3:0 **IMINLINE[3:0]**: Minimum instruction cache line.
Number of words in the smallest cache line of all the instruction caches that the processor controls.
0x3: 8 words

### Debug processor TLB type register (DBG_TLBTR)

Address offset: 0xD0C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | NU |
| | | | | | | | | | | | | | | | r |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **NU**: Unified TLB.
0: Processor has a unified TLB

### Debug processor multi-processor affinity register (DBG_MPIDR)

Address offset: 0xD14

Reset value: 0x8000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | U | Res. | Res. | Res. | Res. | Res. | MT | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | r | | | | | | r | | | | | | | | |

| Res. | Res. | Res. | Res. | CLUSTERID[3:0] | | | | Res. | Res. | Res. | Res. | Res. | Res. | CPUID[1:0] | |
| | | | | r | r | r | r | | | | | | | r | r |

Bit 31 Reserved, must be kept at reset value.

Bit 30 **U**: Uniprocessor system
0: Processor is part of a multi-processor system

Bits 29:25 Reserved, must be kept at reset value.

Bit 24 **MT**: Multi-threading.
Indicates whether the lowest level of affinity consists of logical processors that are implemented using a multi-threading type approach.
0: Processor is part of a multi-processor system

Bits 23:12 Reserved, must be kept at reset value.

Bits 11:8 **CLUSTERID[3:0]**: CLUSTERID configuration.
Indicates the value read in the CLUSTERID configuration pin. It identifies each Cortex-A7 MPCore processor in a system with more than one processor present.

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **CPUID[1:0]**: Processor number.
For two processors, the CPU IDs are 0x0 and 0x1.

### Debug revision ID register (DBG_REVIDR)

Address offset: 0xD18

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ID[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ID[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **ID[31:0]**: Implementation-specific revision information.

### Debug processor feature 0 register (DBG_PFR0)

Address offset: 0xD20

Reset value: 0x0000 1131

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| STATE3[3:0] | | | | STATE2[3:0] | | | | STATE1[3:0] | | | | STATE0[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **STATE3[3:0]**: Support for Thumb execution environment (ThumbEE) instruction set.
1: ThumbEE instruction set implemented

Bits 11:8 **STATE2[3:0]**: Support for Jazelle extension.
1: Processor supports trivial implementation of Jazelle extension

Bits 7:4 **STATE1[3:0]**: Support for Thumb instruction set.
3: Processor supports Thumb encoding after the introduction of Thumb-2 technology, and for all 16-bit and 32-bit Thumb basic instructions.

Bits 3:0 **STATE0[3:0]**: Support for Arm® instruction set.
1: Processor supports Arm® instruction set

### Debug processor feature 1 register (DBG_PFR1)

Address offset: 0xD24

Reset value: 0x0001 1011

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | GENTIMEXT[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| VIRTEXT[3:0] | | | | MPPM[3:0] | | | | SECEXT[3:0] | | | | PROGMOD[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **GENTIMEXT[3:0]**: Generic timer.
1: Processor supports generic timer

Bits 15:12 **VIRTEXT[3:0]**: Virtualisation extensions.
1: Processor supports virtualisation extensions

Bits 11:8 **MPPM[3:0]**: M profile programmers model.
0: Processor does not support microprocessor programmers model

Bits 7:4 **SECEXT[3:0]**: Security extensions.
1: Processor supports security extensions

Bits 3:0 **PROGMOD[3:0]**: Programmers model.
1: Processor supports the standard programmers model for Arm®v4 and later

### Debug feature 0 register (DBG_DFR0)

Address offset: 0xD28

Reset value: 0x0201 0555

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **PMUEXT[3:0]**: Performance monitor model.
2: Processor supports Performance monitor unit version 2 (PMUv2) architecture

Bits 23:20 **MPDBGMOD[3:0]**: Debug model, M profile.
0: Processor does not support M profile debug architecture

Bits 19:16 **MMTMOD[3:0]**: Memory mapped trace model.
1: Processor supports Arm® trace architecture, with memory mapped access

Bits 15:12 **CTMOD[3:0]**: Coprocessor trace model
0: Processor does not support Arm® trace architecture, with CP14 access

Bits 11:8 **MMDBGMOD[3:0]**: Memory mapped debug model.
5: Processor supports v7.1 debug architecture, with memory mapped access

Bits 7:4 **CSDBGMOD[3:0]**: Coprocessor secure debug model.
1: Processor supports v7.1 debug architecture, with CP14 access

Bits 3:0 **CDBGMOD[3:0]**: Coprocessor debug model.
1: Processor supports v7.1 debug architecture, with CP14 access

### Debug processor memory model feature 0 register (DBG_MMFR0)

Address offset: 0xD30

Reset value: 0x1010 1105

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 **INNERSH[3:0]**: Innermost shareability.
1: Processor implements hardware coherency support

Bits 27:24 **FCSE[3:0]**: Fast context switch extension.
0: Processor does not support FCSE

Bits 23:20 **AUXREGS[3:0]**: Auxiliary registers.
1: Processor supports the auxiliary control register only

Bits 19:16 **TCM[3:0]**: TCM and associated DMA.
0: Processor does not support TCM

Bits 15:12 **SHLVLS[3:0]**: Shareability levels
1: Processor implements two levels of shareability

Bits 11:8 **OUTERSH[3:0]**: Outermost shareability
1: Processor supports hardware coherency

Bits 7:4 **PMSA[3:0]**: Protected memory system architecture.
1: Processor does not support PMSA

Bits 3:0 **VMSA[3:0]**: Virtual memory system architecture.
1: Processor supports: VMSAv7 with support for remapping and the access flag; Privileged execute never (PXN) within the first level descriptors; 64-bit address translation descriptors

### Debug processor memory model feature 1 register (DBG_MMFR1)

Address offset: 0xD34

Reset value: 0x4000 0000

Bits 31:28 **BCHPRED[3:0]**: Branch predictor management requirements.
4: Branch predictor requires no flushing at any time

Bits 27:24 **L1CTSTCLN[3:0]**: L1 cache test and clean operations supported.
0: Not supported

Bits 23:20 **L1UNIC[3:0]**: L1 unified cache maintenance operations.
0: Not supported

Bits 19:16 **L1HVDC[3:0]**: L1 Harvard cache maintenance operations.
0: Not supported

Bits 15:12 **L1UNICSW[3:0]**: L1 unified cache set/way line maintenance operations.
0: Not supported

Bits 11:8 **L1HVDCSW[3:0]**: L1 Harvard cache set/way line maintenance operations.
0: Not supported

Bits 7:4 **L1UNICVA[3:0]**: L1 unified cache line maintenance operations by MVA
0: Not supported

Bits 3:0 **L1HVDCVA[3:0]**: L1 Harvard cache line maintenance operations by MVA
0: Not supported

Bits 31:28 **HWACFLG[3:0]**: Hardware access flag.
0: Not supported

Bits 27:24 **WFISTALL[3:0]**: Wait for interrupt stalling.
1: Processor supports WFI stalling

Bits 23:20 **MEMBARR[3:0]**: Memory barrier.
2: Processor supports: Data synchronisation barrier (DSB); Instruction syncronisation barrier (ISB); Data memory barrier (DMB)

Bits 19:16 **UNIFTLB[3:0]**: Unified TLB maintenance operations.
4: Processor supports: Invalidate all entries in TLB; Invalidate TLB entry by MVA; Invalidate TLB entries by ASID match; Invalidate TLB entries by MVA all ASID; Invalidate unified hyp TLB entry by MVA; Invalidate entire non-secure non-hyp unified TLB; Invalidate entire hyp unified TLB

Bits 15:12 **HVDTLB[3:0]**: Harvard TLB maintenance operations.
0: Not supported

Bits 11:8 **L1HRANGE[3:0]**: L1 Harvard cache maintenance operation range
0: Not supported

Bits 7:4 **L1HBGFTCH[3:0]**: L1 Harvard cache background prefetch operations
0: Not supported

Bits 3:0 **L1HFGFTCH[3:0]**: L1 Harvard cache foreground prefetch operations

### Debug processor memory model feature 3 register (DBG_MMFR3)

Address offset: 0xD3C

Reset value: 0x0210 2211

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 **SUPERSECT[3:0]**: Supersection support.
0: Processor supports supersections

Bits 27:24 **CMEMSIZE[3:0]**: Cache physical memory size.
2: Caches support 40-bit memory address

Bits 23:20 **COHWALK[3:0]**: Coherent walk.
1: Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.

Bits 19:16 Reserved, must be kept at reset value.

Bits 15:12 **MAINTBCST[3:0]**: Maintenance broadcast
2: Cache, TLB and branch predictor operations affect structures according to shareability and defined behavior of instructions.

Bits 11:8 **BPMAINT[3:0]**: Branch predictor maintenance.
2: Processor supports: Invalidate entire branch predictor array; Invalidate branch predictor by MVA.

Bits 7:4 **CMAINTSW[3:0]**: Cache maintenance by set/way.
1: Processor supports: Invalidate data cache by set/way; Clean data cache by set/way; Clean and invalidate data cache by set/way.

Bits 3:0 **CMAINTMVA[3:0]**: Cache maintenance by MVA
1: Processor supports: Invalidate data cache by MVA; Clean data cache by MVA; Clean and invalidate data cache by MVA; Invalidate instruction cache by MVA; Invalidate all instruction cache entries.

### Debug processor instruction set attribute 0 register (DBG_ISAR0)

Address offset: 0xD40

Reset value: 0x0210 1110

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **DIVINST[3:0]**: Divide instructions.

2: Processor supports: SDIV and UDIV in the Thumb instruction set; SDIV and UDIV in the Arm® instruction set.

Bits 23:20 **DBGINST[3:0]**: Debug instructions.

1: Processor supports BKPT instruction

Bits 19:16 **COPROINST[3:0]**: Coprocessor instructions.

0: None supported, except for separately attributed architectures including CP15, CP14, and Advanced SIMD and VFP.

Bits 15:12 **CMPBRINST[3:0]**: Combined compare and branch instructions.

1: Processor supports CBNZ and CBZ instructions

Bits 11:8 **BITFLDINST[3:0]**: Bit field instructions.

1: Processor supports BFC, BFI, SBFX and UBFX instructions

Bits 7:4 **BITCNTINST[3:0]**: Bit count instructions.

1: Processor supports CLZ instruction

Bits 3:0 **SWAPINST[3:0]**: Swap instructions.

0: SWP and SWPB instructions supported fractionally

### Debug processor instruction set attribute 1 register (DBG_ISAR1)

Address offset: 0xD44

Reset value: 0x1311 2111

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| EXTNDINST[3:0] | | | | EXCARINST[3:0] | | | | EXCINST[3:0] | | | | ENDIANINST[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 **JAZINST[3:0]**: Jazelle extension instructions.
1: Processor supports: BXJ instruction, and the J bit in the PSR

Bits 27:24 **INTWKINST[3:0]**: Interworking instructions.
3: Processor supports: BX instruction, and the T bit in the PSR; BLX instruction, and PC loads have BX-like behavior; Data-processing instructions in the Arm® instruction set with the PC as the destination and the S bit cleared to 0, have BX-like behavior

Bits 23:20 **IMMINST[3:0]**: Immediate instructions.
1: Processor supports: MOVT instruction; MOV instruction encodings with zero-extended 16-bit immediates; Thumb ADD and SUB instruction encodings with zero-extended 12-bit immediates, and other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

Bits 19:16 **IFTHENINST[3:0]**: Thumb If-then instructions.
1: Processor supports the IT instructions, and the IT bits in the PSRs

Bits 15:12 **EXTNDINST[3:0]**: Extend instructions.
2: Processor supports: SXTB, SXTH, UXTB, and UXTH instructions; SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions

Bits 11:8 **EXCARINST[3:0]**: A and R profile exception-handling instructions.
1: Processor supports SRS, RFE and CPS instructions

Bits 7:4 **EXCINST[3:0]**: Exception-handling instructions.
1: Processor supports LDM (exception return), LDM (user registers), and STM (user registers) instructions

Bits 3:0 **ENDIANINST[3:0]**: Endian instructions.
1: Processor supports SETEND instruction, and the E bit in the PSRs

### Debug processor instruction set attribute 2 register (DBG_ISAR2)

Address offset: 0xD48

Reset value: 0x2123 2041

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| REVSALINST[3:0] | | | | PSRINST[3:0] | | | | MULTUINST[3:0] | | | | MULTSINST[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MULTINST[3:0] | | | | MULACINST[3:0] | | | | MEMHTINST[3:0] | | | | LDSTRINST[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 **REVSALINST[3:0]**: Reversal instructions.
2: Processor supports REV, REV16, REVSH and RBIT instructions

Bits 27:24 **PSRINST[3:0]**: PSR instructions.
1: Processor supports MRS and MSR instructions, and the exception return forms of data-processing instructions

Bits 23:20 **MULTUINST[3:0]**: Advanced unsigned multiply instructions.
2: Processor supports UMULL, UMLAL, and UMAAL instructions

Bits 19:16 **MULTSINST[3:0]**: Advanced signed multiply instructions.
3: Processor supports: SMULL and SMLAL instructions; SMLABB, SMLABT, SMLALBB,SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, SMULWT instructions, and the Q bit in the PSRs; SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions

Bits 15:12 **MULTINST[3:0]**: Additional multiply instructions.
2: Processor supports MUL, MLA and MLS instructions

Bits 11:8 **MULACINST[3:0]**: Interruptible multi-access instructions.
0: None supported. This means that the processor does not support interruptible LDM and STM instructions

Bits 7:4 **MEMHTINST[3:0]**: Memory hint instructions.
4: Processor supports PLD, PLI (NOP), and PLDW instructions

Bits 3:0 **LDSTRINST[3:0]**: Additional load/store instructions.
1: Processor supports LDRD and STRD instructions

### Debug processor instruction set attribute 3 register (DBG_ISAR3)

Address offset: 0xD4C

Reset value: 0x1111 2131

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| TEEXTINST[3:0] | | | | TRNOPINST[3:0] | | | | THCPYINST[3:0] | | | | TABBRINST[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SYNPRIINST[3:0] | | | | SVCINST[3:0] | | | | SIMDINST[3:0] | | | | SATINST[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 **TEEXTINST[3:0]**: Thumb Execution Environment (ThumbEE) instructions.
1: Processor supports ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking

Bits 27:24 **TRNOPINST[3:0]**: True NOP instructions.
1: Processor supports true NOP instructions in both the Arm® and Thumb instruction sets, and the capability for additional NOP-compatible hints

Bits 23:20 **THCPYINST[3:0]**: Thumb copy instructions.
1: Processor supports Thumb instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register

Bits 19:16 **TABBRINST[3:0]**: Table branch instructions.
1: Processor supports TBB and TBH instructions

Bits 15:12 **SYNPRIINST[3:0]**: Synchronisation primitive instructions.
2: Processor supports: LDREX and STREX instructions; CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions; LDREXD and STREXD instructions

Bits 11:8 **SVCINST[3:0]**: SVC instructions.
1: Processor supports SVC instruction

Bits 7:4 **SIMDINST[3:0]**: Single instruction multiple data (SIMD) instructions.
3: Processor supports: SSAT and USAT instructions, and the Q bit in the PSRs; PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, UXTB16 instructions, and the GE[3:0] bits in the PSRs

Bits 3:0 **SATINST[3:0]**: Saturate instructions.
1: Processor supports QADD, QDADD, QDSUB, QSUB and the Q bit in the PSRs

### Debug processor instruction set attribute 4 register (DBG_ISAR4)

Address offset: 0xD50

Reset value: 0x1001 1142

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| SWPFRAC[3:0] | | | | PSRMINST[3:0] | | | | SPINSFRAC[3:0] | | | | BARRINST[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SMCINST[3:0] | | | | WRBKINST[3:0] | | | | WSHFTINST[3:0] | | | | UNPRIVINST[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 **SWPFRAC[3:0]**: Support for the memory system locking the bus for SWP or SWPB instructions:.
1: Processor supports SWP and SWPB instruction but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB instruction

Bits 27:24 **PSRMINST[3:0]**: M profile instructions to modify the PSRs.
0: None supported

Bits 23:20 **SPINSFRAC[3:0]**: Synchronisation primitive instructions.
0: Processor supports: LDREX and STREX instructions; CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions; LDREXD and STREXD instructions

Bits 19:16 **BARRINST[3:0]**: Barrier instructions.
1: Processor supports DMB, DSB and ISB instructions

Bits 15:12 **SMCINST[3:0]**: SMC instructions.
1: Processor supports SMC instruction

Bits 11:8 **WRBKINST[3:0]**: Write-back addressing modes.
1: Processor supports all Write-Back addressing modes defined in Arm®v7 architecture

Bits 7:4 **WSHFTINST[3:0]**: Instructions with shifts.
4: Processor supports: Shifts of loads and stores over the range LSL 0-3; Constant shift options, both on load/store and other instructions; Register-controlled shift options.

Bits 3:0 **UNPRIVINST[3:0]**: Unprivileged instructions.
2: Processor supports: LDRBT, LDRT, STRBT, and STRT instructions; LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CLR[7:0]**: Reset claim tag bits
Write:
00000000: No effect
xxxxxxx1: Clear bit 0
xxxxxx1x: Clear bit 1
xxxxx1xx: Clear bit 2
xxxx1xxx: Clear bit 3
...etc.
Read: Returns current value of claim tag

### DBG lock access register (DBG_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| KEY[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| KEY[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **KEY[31:0]**: DBG register write access
Enables write access to some DBG registers by processor cores (debuggers do not need to unlock the component)
0xC5ACCE55: Enable write access
Other values: Disable write access

### DBG lock status register (DBG_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | NTT | SLK | SLI |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **NTT**: Size of the DBG_LAR register
0: 32-bit

Bit 1 **SLK**: Current status of lock
This bit always returns zero when read by an external debugger.
0: Write access is permitted
1: Write access is blocked. Only read access is permitted.

Bit 0 **SLI**: Existence of lock control mechanism
The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.
0: No lock control mechanism exists
1: Lock control mechanism is implemented

### DBG authentication status register (DBG_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNI | SNE | SI | SE | NSNI | NSNE | NSI | NSE |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **SNI**: Secure non-invasive debug
1: Secure non-invasive debug features implemented

Bit 6 **SNE**: Secure non-invasive debug enabled
0: Non-invasive debug is not permitted in secure PL1 modes
1: Non-invasive debug is permitted in secure PL1 modes

Bit 5 **SI**: Secure invasive debug
1: Secure invasive debug features implemented

Bit 4 **SE**: Secure invasive debug enabled
0: Invasive halting debug is not permitted in secure PL1 modes
1: Invasive halting debug is permitted in secure PL1 modes

Bit 3 **NSNI**: Non-secure non-invasive debug
1: Non-secure non-invasive debug features implemented

Bit 2 **NSNE**: Non-secure non-invasive debug enabled
0: Non-secure non-invasive debug is not permitted
1: Non-secure non-invasive debug is permitted

Bit 1 **NSI**: Non-secure invasive debug
1: Non-secure invasive debug features implemented

Bit 0 **NSE**: Non-secure invasive debug enabled
0: Non-secure invasive debug is not permitted
1: Non-secure invasive debug is permitted

### DBG CoreSight device ID 1 register (DBG_DEVID1)

Address offset: 0xFC4

Reset value: 0x0000 0001

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PCSROFFSET[7:0]**: DBGPCSR offset
0x1: No offset applied

### DBG Coresight device configuration register (DBG_DEVID)

Address offset: 0xFC8

Reset value: 0x0111 0F13

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CIDMASK[3:0] | | | | AUXREGS[3:0] | | | | DOUBLELOCK[3:0] | | | | VIREXTNS[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VECTORCATCH[3:0] | | | | BPADDRMASK[3:0] | | | | WPADDRMASK[3:0] | | | | PCSAMPLE[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:28 **CIDMASK[3:0]**: Context ID matching breakpoint masking
0x0: Not implemented

Bits 27:24 **AUXREGS[3:0]**: Debug external auxiliary control register.
0x1: The processor supports debug external auxiliary control register

Bits 23:20 **DOUBLELOCK[3:0]**: Debug OS double lock register.
0x1: The processor supports debug OS double lock register

Bits 19:16 **VIREXTNS[3:0]**: Virtualisation extensions.
0x1: The processor implements the Virtualization Extensions to the Debug architecture

Bits 15:12 **VECTORCATCH[3:0]**: Vector catch event.
0x0: The processor implements address matching form of vector catch

Bits 11:8 **BPADDRMASK[3:0]**: Immediate Virtual Address (IVA) matching breakpoint masking.
0xF: Not implemented

Bits 7:4 **WPADDRMASK[3:0]**: DVA matching watchpoint masking.
0x1: Watchpoint address mask implemented

Bits 3:0 **PCSAMPLE[3:0]**: Program Counter sampling using debug registers 40, 41, and 42.
0x3: DBGPCSR, DBGCIDSR and DBGVIDSR are implemented as debug registers 40, 41 and 42

### DBG CoreSight device type register (DBG_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0015

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: Register file size
0x0: Register file occupies a single 4 Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code
0x4: Arm® JEDEC code

### DBG CoreSight peripheral identity register 0 (DBG_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0007

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

For the debug unit register descriptions, refer to the *Cortex®-A7 MPCore Technical Reference Manual [9]*.

## 66.11.2 Cortex®-A7 performance monitoring unit (PMU)

The Performance Monitoring Unit contains four 32-bit event counters, and one processor clock cycle counter. The event counters can be configured to increment every time a specified event occurs. Examples of events that can be counted include:

- Cache hit/miss
- Data load/store
- Bus access
- Interrupt exception
- ETM external trigger output
- Snoop transaction
- Software increment

When a counter wraps, it can generate an interrupt on PMUIRQ. This interrupt is connected to the CTI so can halt the processor(s), start or stop trace, etc.

Most of the events are connected to the ETM via the PMUEVENTS bus. This allows the resources of the ETM to be used to filter the events. The filtered events are returned to the PMU via the two EXTOUT outputs of the ETM.

For a list of PMU events and the corresponding line of the PMUEVENTS bus, refer to the *Cortex®-A7 MPCore Technical Reference Manual [9]*.

### Performance monitoring unit registers

The Performance Monitoring Unit registers are accessed by the debugger via the debug APB, at address 0xE00D 1000 to 0xE00D 1FFC for the CA7-CPU1 PMU, and 0xE00D 3000 to 0xE00D 3FFC for the CA7-CPU2. The same registers are accessible by software at addresses 0x500D 1000 to 0x500D 1FFC and 0x500D 3000 to 0x500D 3FFC respectively.

Each CPU can also access the registers of its own PMU via CP15 registers.

For the PMU register descriptions, refer to the *Cortex®-A7 MPCore Technical Reference Manual [9]*.

### PMU event count x register (PM_XEVCNTRx)

Address offset: 0x000 + 0x4 *x, (x = 0 to 3)

Reset value: 0xXXXX XXXX

Read or write the value of the selected event counter, PMNn, where n = 0..3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PMN[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PMN[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **PMN[31:0]**: Event counter value.

### PMU cycle count register (PM_CCNTR)

Address offset: 0x07C

Reset value: 0x0000 0000

Holds the value of the processor cycle counter.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| CCNT[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **CCNT[31:0]**: Cycle count.

Cycle count. Depending on the value of PM_CR.D, this field increments either once every processor clock cycle or once every 64 processor clock cycles.

### PMU event type select x register (PM_XEVTYPERx)

Address offset: 0x400 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0XXX XXXX

Controls which events increment the corresponding event counter, and in which modes.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **P**: Privileged execution filtering.

0: Count events when executing at PL1

1: Do not count events when executing at PL1

Bit 30 **U**: Unprivileged execution filtering.

0: Count events when executing at PL0

1: Do not count events when executing at PL0

Bit 29 **NSK**: Non-secure PL1 control bit.

Controls counting when executing in Non-secure state at PL1. The behavior depends on the combined values of the P and NSK bits:

P=NSK: In Non-secure state, count events when executing at PL1

P!=NSK: In Non-secure state, do not count events when executing at PL1

Bit 28 **NSU**: Non-secure unprivileged control bit.
Controls counting in when executing in Non-secure at PL0. The behavior depends on the combined values of the U and NSU bits:
U=NSU: In Non-secure state, count events when executing at PL0
U!=NSU: In Non-secure state, do not count events when executing at PL0

Bit 27 **NSH**: Non-secure PL2 enable.
0: In Non-secure state, do not count events when executing at PL2
1: In Non-secure state, count events when executing at PL2

Bits 26:8 Reserved, must be kept at reset value.

Bits 7:0 **EVTCOUNT[7:0]**: Event to count.
The event number of the event that is counted by the corresponding event counter, PMNn where n = 0..3

### PMU event type select 31 register (PM_XEVTYPER31)

Address offset: 0x47C

Reset value: 0x0XXX XXXX

Controls in which modes the cycle counter increments.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| P | U | NSK | NSU | NSH | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | | | | | | |

Bit 31 **P**: Privileged execution filtering.
0: Count cycles when executing at PL1
1: Do not count cycles when executing at PL1

Bit 30 **U**: Unprivileged execution filtering.
0: Count cycles when executing at PL0
1: Do not count cycles when executing at PL0

Bit 29 **NSK**: Non-secure PL1 control bit.
Controls counting when executing in Non-secure state at PL1. The behavior depends on the combined values of the P and NSK bits:
P=NSK: In Non-secure state, count cycles when executing at PL1
P!=NSK: In Non-secure state, do not count cycles when executing at PL1

Bit 28 **NSU**: Non-secure unprivileged control bit.
Controls counting in when executing in Non-secure at PL0. The behavior depends on the combined values of the U and NSU bits:
U=NSU: In Non-secure state, count cycles when executing at PL0
U!=NSU: In Non-secure state, do not count cycles when executing at PL0

Bit 27 **NSH**: Non-secure PL2 enable.
0: In Non-secure state, do not count cycles when executing at PL2
1: In Non-secure state, count cycles when executing at PL2

Bits 26:0 Reserved, must be kept at reset value.

### PMU count enable set register (PM_CNTENSET)

Address offset: 0xC00

Reset value: 0xXXXX XXXX

Enables the cycle counter and event counters, PMN0..3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 **C**: Cycle counter enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable cycle counter

Bits 30:4 Reserved, must be kept at reset value.

Bit 3 **P3**: Event counter 3 enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable event counter

Bit 2 **P2**: Event counter 2 enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable event counter

Bit 1 **P1**: Event counter 1 enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable event counter

Bit 0 **P0**: Event counter 0 enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable event counter

### PMU count enable clear register (PM_CNTENCLR)

Address offset: 0xC20

Reset value: 0xXXXX XXXX

Disables the cycle counter and event counters, PMN0..3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 **C**: Cycle counter disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable cycle counter

Bits 30:4 Reserved, must be kept at reset value.

Bit 3 **P3**: Event counter 3 disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable event counter

Bit 2 **P2**: Event counter 2 disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable event counter

Bit 1 **P1**: Event counter 1 disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable event counter

Bit 0 **P0**: Event counter 0 disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable event counter

### PMU interrupt enable set register (PM_INTENSET)

Address offset: 0xC40

Reset value: 0xXXXX XXXX

Enables generation of interrupt request by the cycle counter and event counters, PMN0..3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| C | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | | | | | | | | | | | | rw | rw | rw | rw |

Bit 31 **C**: Cycle counter interrupt request enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable interrupt request on cycle counter overflow

Bits 30:4 Reserved, must be kept at reset value.

Bit 3 **P3**: Event counter 3 interrupt request enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable interrupt request on event counter overflow

Bit 2 **P2**: Event counter 2 interrupt request enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable interrupt request on event counter overflow

Bit 1 **P1**: Event counter 1 interrupt request enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable interrupt request on event counter overflow

Bit 0 **P0**: Event counter 0 interrupt request enable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Enable interrupt request on event counter overflow

### PMU interrupt enable clear register (PM_INTENCLR)

Address offset: 0xC60

Reset value: 0xXXXX XXXX

Disables generation of interrupt requests by the cycle counter and event counters, PMN0..3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| C | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | P3 | P2 | P1 | P0 |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bit 31 **C**: Cycle counter interrupt disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable interrupt request on cycle counter overflow

Bits 30:4 Reserved, must be kept at reset value.

Bit 3 **P3**: Event counter 3 interrupt disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable interrupt request on event counter overflow

Bit 2 **P2**: Event counter 2 interrupt disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable interrupt request on event counter overflow

Bit 1 **P1**: Event counter 1 interrupt disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable interrupt request on event counter overflow

Bit 0 **P0**: Event counter 0 interrupt disable.
Read:
0: Disabled
1: Enabled
Write:
0: No effect
1: Disable interrupt request on event counter overflow

### PMU overflow flag status register (PM_OVSR)

Address offset: 0xC80

Reset value: 0xXXXX XXXX

Holds the status of the overflow bits for the cycle counter and event counters, PMN0..3.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| C | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | P3 | P2 | P1 | P0 |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bit 31 **C**: Cycle counter overflow.
Read:
0: No overflow occurred
1: Overflow occurred
Write:
0: No effect
1: Reset overflow bit

Bits 30:4 Reserved, must be kept at reset value.

Bit 3 **P3**: Event counter 3 overflow.
Read:
0: No overflow occurred
1: Overflow occurred
Write:
0: No effect
1: Reset overflow bit

Bit 2 **P2**: Event counter 2 overflow.
Read:
0: No overflow occurred
1: Overflow occurred
Write:
0: No effect
1: Reset overflow bit

Bit 1 **P1**: Event counter 1 overflow.
Read:
0: No overflow occurred
1: Overflow occurred
Write:
0: No effect
1: Reset overflow bit

Bit 0 **P0**: Event counter 0 overflow.
Read:
0: No overflow occurred
1: Overflow occurred
Write:
0: No effect
1: Reset overflow bit

### PMU software increment register (PM_SWINC)

Address offset: 0xCA0

Reset value: 0xXXXX XXXX

Increments a counter that is configured to count the software increment event, event 0x00.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | P3 | P2 | P1 | P0 |
| | | | | | | | | | | | | w | w | w | w |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **P3**: Event counter 3 increment.
- 0: No effect
- 1: Increment counter by 1

Bit 2 **P2**: Event counter 2 increment.
- 0: No effect
- 1: Increment counter by 1

Bit 1 **P1**: Event counter 1 increment.
- 0: No effect
- 1: Increment counter by 1

Bit 0 **P0**: Event counter 0 increment.
- 0: No effect
- 1: Increment counter by 1

### PMU configuration register (PM_CFGR)

Address offset: 0xE00

Reset value: 0xXXX9 DF04

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | UEN | Res. | Res. | EX |
| | | | | | | | | | | | | r | | | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CCD | CC | SIZE[5:0] | | | | | | N[7:0] | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **UEN**: User-mode enable register.
- 1: User-mode enable register implemented

Bits 18:17 Reserved, must be kept at reset value.

Bit 16 **EX**: Export.
1: Export is supported

Bit 15 **CCD**: Cycle counter divider.
1: Cycle counter divider implemented

Bit 14 **CC**: Cycle counter.
1: Cycle counter implemented

Bits 13:8 **SIZE[5:0]**: Counter size.
0x1F: 32-bit counters

Bits 7:0 **N[7:0]**: Number of event counters.
0x04: Four event counters

### PMU control register (PM_CR)

Address offset: 0xE04

Reset value: 0x4107 2000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| IMP[7:0] | | | | | | | | IDCODE[7:0] | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N[4:0] | | | | | Res. | Res. | Res. | Res. | Res. | DP | X | D | C | P | E |
| r | r | r | r | r | | | | | | rw | rw | rw | w | w | rw |

Bits 31:24 **IMP[7:0]**: Implementer code.
0x41: Arm®

Bits 23:16 **IDCODE[7:0]**: Identification code.
0x07: Cortex-A7 MP core

Bits 15:11 **N[4:0]**: Number of event counters.
In Secure state and Hyp mode, this field returns 0x4 that indicates the number of counters implemented.
In Non-secure modes other than Hyp mode, this field reads the value of the processor HDCR.HPMN register field.

Bits 10:6 Reserved, must be kept at reset value.

Bit 5 **DP**: Disable cycle counter in prohibited regions.
0: Counter is enabled in prohibited regions
1: Counter is disabled in prohibited regions

Bit 4 **X**: Export enable.
This bit permits events to be exported to another debug device, such as a trace macrocell, over an event bus:
0: Export of events is disabled
1: Export of events is enabled

Bit 3 **D**: Clock divider.
0: Cycle counter counts every clock cycle
1: Cycle counter counts once every 64 clock cycles

Bit 2 **C**: Clock counter reset.
0: No effect
1: Reset cycle counter to 0

Bit 1 **P**: Event counter reset.
0: No effect
1: Reset all event counters to 0

Bit 0 **E**: Enable.
0: All counters, including the cycle counter, are disabled
1: All counters are enabled

### PMU user enable register (PM_USERENR)

Address offset: 0xE08

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EN |
| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **EN**: User mode access enable.
0: User mode access is disabled
1: User mode access is enabled

### PMU common event ID 0 register (PM_CEID0)

Address offset: 0xE20

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | EVENTID29 | EVENTID28 | EVENTID27 | EVENTID26 | EVENTID25 | EVENTID24 | EVENTID23 | EVENTID22 | EVENTID21 | EVENTID20 | EVENTID19 | EVENTID18 | EVENTID17 | EVENTID16 |
| | | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EVENTID15 | EVENTID14 | EVENTID13 | EVENTID12 | EVENTID11 | EVENTID10 | EVENTID9 | EVENTID8 | EVENTID7 | EVENTID6 | EVENTID5 | EVENTID4 | EVENTID3 | EVENTID2 | EVENTID1 | EVENTID0 |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **EVENTID29**: Event ID 0x1D user mode access enable
Event number 0x1D corresponds to event:
“Bus cycle”.
0: Event implemented
1: Event not implemented

Bit 28 **EVENTID28**: Event ID 0x1C user mode access enable
Event number 0x1C corresponds to event:
“Instruction architecturally executed, condition code check pass, write to TTBR”.
0: Event implemented
1: Event not implemented

Bit 27 **EVENTID27**: Event ID 0x1B user mode access enable
Event number 0x1B corresponds to event:
“Instruction speculatively executed”.
0: Event implemented
1: Event not implemented

Bit 26 **EVENTID26**: Event ID 0x1A user mode access enable
Event number 0x1A corresponds to event
“Local memory error”.
0: Event implemented
1: Event not implemented

Bit 25 **EVENTID25**: Event ID 0x19 user mode access enable
Event number 0x19 corresponds to event:
“Bus access”.
0: Event implemented
1: Event not implemented

Bit 24 **EVENTID24**: Event ID 0x18 user mode access enable
Event number 0x18 corresponds to event:
“Level 2 data cache write-back”.
0: Event implemented
1: Event not implemented

Bit 23 **EVENTID23**: Event ID 0x17 user mode access enable
Event number 0x17 corresponds to event:
“Level 2 data cache refill”.
0: Event implemented
1: Event not implemented

Bit 22 **EVENTID22**: Event ID 0x16 user mode access enable
Event number 0x16 corresponds to event:
“Level 2 data cache access”.
0: Event implemented
1: Event not implemented

Bit 21 **EVENTID21**: Event ID 0x15 user mode access enable
Event number 0x15 corresponds to event:
“Level 1 data cache write-back”.
0: Event implemented
1: Event not implemented

Bit 20 **EVENTID20**: Event ID 0x14 user mode access enable
Event number 0x14 corresponds to event:
“Level 1 instruction cache access”.
0: Event implemented
1: Event not implemented

Bit 19 **EVENTID19**: Event ID 0x13 user mode access enable
Event number 0x13 corresponds to event:
“Data memory access”.
0: Event implemented
1: Event not implemented

Bit 18 **EVENTID18**: Event ID 0x12 user mode access enable
Event number 0x12 corresponds to event:
“Predictable branch speculatively executed”.
0: Event implemented
1: Event not implemented

Bit 17 **EVENTID17**: Event ID 0x11 user mode access enable
Event number 0x11 corresponds to event:
“Cycle”.
0: Event implemented
1: Event not implemented

Bit 16 **EVENTID16**: Event ID 0x10 user mode access enable
Event number 0x10 corresponds to event:
“Mispredicted or not predicted branch speculatively executed”.
0: Event implemented
1: Event not implemented

Bit 15 **EVENTID15**: Event ID 0xF user mode access enable
Event number 0xF corresponds to event
“Instruction architecturally executed, condition code check pass, unaligned load or store”.
0: Event implemented
1: Event not implemented

Bit 14 **EVENTID14**: Event ID 0xE user mode access enable
Event number 0xE corresponds to event:
“Instruction architecturally executed, condition code check pass, procedure return”.
0: Event implemented
1: Event not implemented

Bit 13 **EVENTID13**: Event ID 0xD user mode access enable
Event number 0xD corresponds to event:
“Instruction architecturally executed, immediate branch”.
0: Event implemented
1: Event not implemented

Bit 12 **EVENTID12**: Event ID 0xC user mode access enable
Event number 0xC corresponds to event:
“Instruction architecturally executed, condition code check pass, software change of the PC”.
0: Event implemented
1: Event not implemented

Bit 11 **EVENTID11**: Event ID 0xB user mode access enable
Event number 0xB corresponds to event:
“Instruction architecturally executed, condition code check pass, write to CONTEXTIDR”.
0: Event implemented
1: Event not implemented

Bit 10 **EVENTID10**: Event ID 0xA user mode access enable
Event number 0xA corresponds to event:
“Instruction architecturally executed, condition code check pass, exception return”.
0: Event implemented
1: Event not implemented

Bit 9 **EVENTID9**: Event ID 0x9 user mode access enable
Event number 0x9 corresponds to event:
“Exception taken”.
0: Event implemented
1: Event not implemented

Bit 8 **EVENTID8**: Event ID 0x8 user mode access enable
Event number 0x8 corresponds to event:
“Instruction architecturally executed”.
0: Event implemented
1: Event not implemented

Bit 7 **EVENTID7**: Event ID 0x7 user mode access enable
Event number 0x7 corresponds to event:
“Instruction architecturally executed, condition code check pass, store”.
0: Event implemented
1: Event not implemented

Bit 6 **EVENTID6**: Event ID 0x6 user mode access enable
Event number 0x6 corresponds to event:
“Instruction architecturally executed, condition code check pass, load”.
0: Event implemented
1: Event not implemented

Bit 5 **EVENTID5**: Event ID 0x5 user mode access enable
Event number 0x5 corresponds to event:
“Level 1 data TLB refill”.
0: Event implemented
1: Event not implemented

Bit 4 **EVENTID4**: Event ID 0x4 user mode access enable
Event number 0x4 corresponds to event:
“Level 1 data cache access”.
0: Event implemented
1: Event not implemented

Bit 3 **EVENTID3**: Event ID 0x3 user mode access enable
Event number 0x3 corresponds to event:
“Level 1 data cache refill”.
0: Event implemented
1: Event not implemented

Bit 2 **EVENTID2**: Event ID 0x2 user mode access enable
Event number 0x2 corresponds to event:
“Level 1 instruction TLB refill”.
0: Event implemented
1: Event not implemented

Bit 1 **EVENTID1**: Event ID 0x1 user mode access enable
Event number 0x1 corresponds to event:
“Level 1 instruction cache refill”.
0: Event implemented
1: Event not implemented

Bit 0 **EVENTID0**: Event ID 0x0 user mode access enable
Event number 0x0 corresponds to event:
“Instruction architecturally executed, condition code check pass, software increment”.
0: Event implemented
1: Event not implemented

### PMU lock access register (PM_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| KEY[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| KEY[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **KEY[31:0]:** PMU register write access
Enables write access to some PMU registers by processor cores
0xC5ACCE55: Enable write access
Other values: Disable write access

### PMU lock status register (PM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | NTT | SLK | SLI |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **NTT:** Size of the PM_LAR register
0: 32-bit

Bit 1 SLK: Current status of lock
0: Write access is permitted
1: Write access is blocked. Only read access is permitted.

Bit 0 SLI: Existence of lock control mechanism
The bit indicates whether a lock control mechanism exists.
0: No lock control mechanism exists
1: Lock control mechanism is implemented

### PMU authentication status register (PM_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNI | SNE | SI | SE | NSNI | NSNE | NSI | NSE |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **SNI:** Secure non-invasive debug
1: Secure non-invasive debug features implemented

Bit 6 **SNE:** Secure non-invasive debug enabled
0: Non-invasive debug is not permitted in secure PL1 modes
1: Non-invasive debug is permitted in secure PL1 modes

Bit 5 SI: Secure invasive debug
0: Secure invasive debug features not implemented

Bit 4 SE: Secure invasive debug enabled
0: Invasive halting debug is not permitted in secure PL1 modes

Bit 3 **NSNI:** Non-secure non-invasive debug
1: Non-secure non-invasive debug features implemented

Bit 2 **NSNE:** Non-secure non-invasive debug enabled
0: Non-secure non-invasive debug is not permitted
1: Non-secure non-invasive debug is permitted

Bit 1 NSI: Non-secure invasive debug
0: Non-secure invasive debug features not implemented

Bit 0 NSE: Non-secure invasive debug enabled
0: Non-secure invasive debug is not permitted

### PMU CoreSight device type register (PM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0016

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.11.3 Embedded trace macrocell (ETM)

The Cortex®-A7 ETM is a CoreSight™ component closely coupled to the CPU. There are two ETM units, one for each CA7 core. The ETM generates trace packets that allow the execution of the Cortex®-A7 core to be traced. Both instruction execution and data accesses can be traced.

The ETM receives information from the CPU over the processor trace interface, including:

- The number of instructions executed in the same cycle
- Changes in program flow
- The current processor instruction state
- The addresses of memory locations accessed by load and store instructions
- The type, direction and size of a transfer
- Condition code information
- Exception information
- Wait for interrupt state information

For more information, refer to the *Arm® CoreSight™ ETM™-A7 technical reference manual [6]*.

### Embedded trace macrocell registers

The ETM registers are accessed by the debugger via the debug APB, at address range 0xE00D C000 to 0xE00D CFFC. They are accessible by software at address range 0x500D C000 to 0x500D CFFC.

For the ETM register descriptions, refer to the *Arm® CoreSight™ ETM™-A7 technical reference manual [6]*.

### ETM control register (ETM_CR)

Address offset: 0x000

Reset value: 0x0000 0461

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | VMIDTRCEN | Res. | TSEN | PROCSEL[2:0] | | | Res. | Res. | Res. | PORTSIZE[3] | DATAONLY | FILTERCPRT | SUPPDATA | PORTMODE[1:0] | |
| | rw | | rw | rw | rw | rw | | | | r | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CONTXTIDSIZE[1:0] | | PORTMODE[2] | CYCLEACC | ETMPORTSEL | ETMPROG | DBGRQCTL | BRANCHOUTPUT | Res. | PORTSIZE[2:0] | | | DATAACC[1:0] | | MONITORCPRT | ETMPDN |
| rw | rw | rw | rw | rw | rw | rw | rw | | r | r | r | rw | rw | rw | rw |

Bit 31 Reserved, must be kept at reset value.

Bit 30 **VMIDTRCEN**: VMID trace enable
0: VMID tracing disabled
1: VMID tracing enabled

Bit 29 Reserved, must be kept at reset value.

Bit 28 **TSEN**: Timestamping enable
0: Timestamping disabled
1: Timestamping enabled

Bits 27:25 **PROCSEL[2:0]**: Processor select.
0: Select CPU0 to trace
1: Select CPU1 to traceReserved
2: Reserved
3: Reserved

Bits 24:22 Reserved, must be kept at reset value.

Bit 20 **DATAONLY**: Data-only mode
0: Instruction trace enabled
1: Data-only tracing enabled

Bit 19 **FILTERCPRT**: Filter co-processor register transfers
If MONITORCPRT = 0, this bit should be set to 0.
If MONITORCPRT = 1, this bit has the following effect:
0: All CPRT's traced
1: CPRT's only traced when ViewData is active.

Bit 18 **SUPPDATA**: Enable data suppression
0: Do not suppress data
1: Suppress data when FIFO empty count < ETMFFLR.FIFOFULLLVL

Bits 15:14 **CONTXTIDSIZE[1:0]**: Context ID size.
0: No context ID tracing
1: Context ID bits [7:0] traced
2: Context ID bits [15:0] traced
3: Context ID bits [31:0] traced

Bits 13, 17:16 **PORTMODE[2:0]**: Set trace port clocking mode
Setting PORTMODE[2:0] to any value selects dynamic mode.

Bit 12 **CYCLEACC**: Cycle accurate tracing
0: Disabled
1: Enabled. Include a precise cycle count of executed instructions

Bit 11 **ETMPORTSEL**: Control state of ETMEN output
0: ETMEN is low
1: ETMEN is high
This bit must be set to 1 to enable trace output

Bit 10 **ETMPROG**: ETM programming
This bit must be set to 1 before programming the ETM. Tracing is prevented while this bit is set to 1.
0: ETM operational
1: ETM in programming state

Bit 9 **DBGRQCTL**: Debug request control**.**
0: DBGRQ output is not set on a trigger event.
1: DBGRQ output is set on a trigger event to force the processor into debug state

Bit 8 **BRANCHOUTPUT**: Branch output
0: Branch addresses not traced
1: All branch addresses are output, even if the branch was because of a direct branch instruction. Setting this bit enables reconstruction of the program flow without having access to the memory image of the code being executed

Bit 7 Reserved, must be kept at reset value.

Bits 21, 6:4 **PORTSIZE[3:0]**: Port size
Setting PORTSIZE[3:0] to any value selects 64-bit port size.

Bits 3:2 **DATAACC[1:0]**: Data access tracing mode.
0: No data tracing
1: Trace only the data portion of the access
2: Trace only the address portion of the access
3: Trace both the address and data of the access

Bit 1 **MONITORCPRT**: Monitor co-processor register transfers
0: CPRT's not traced
1: CPRT's traced. If FILTERCPRT = 1, CPRT's are only traced when ViewData is active.

Bit 0 **ETMPDN**: ETM power down
0: ETM tracing is enabled
1: ETM tracing is disabled, and ETM is in low power mode

### ETM configuration code register (ETM_CCR)

Address offset: 0x004

Reset value: 0x8D29 4024

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 **IDREG**: ETM ID register present
1: ETMIDR register is present and defines the ETM architecture version in use

Bits 30:28 Reserved, must be kept at reset value.

Bit 27 **SWACC**: Co-processor and memory access
1: Memory-mapped access to registers is supported

Bit 26 **STARTSTOP**: Trace start/stop block present
1: Trace start/stop block is present

Bits 25:24 **CONTXTIDCMP[1:0]**: Number of context ID comparators
0x1: One context ID comparator implemented

Bit 23 **FIFOFULL**: FIFOFULL logic present
0: FIFOFULL logic is not present in the ETM

Bit 22 Reserved, must be kept at reset value.

Bits 21:20 **EXTOUTPUTS[1:0]**: Number of external outputs
0x2: Two external outputs are supported

Bits 19:17 **EXTINPUTS[2:0]**: Number of external inputs
0x4: Four external inputs are supported

Bit 16 **SEQUENCER**: Sequencer present
1: The sequencer is present in the ETM.

Bits 15:13 **COUNTERS[2:0]**: Number of counters
0x2: Two counters are implemented

Bits 12:8 **MMAPDECS[4:0]**: Number of memory map decoders
0x0: No memory map decoder inputs are implemented.

Bits 7:4 **DATACOMPS[3:0]**: Number of data value comparators
0x2: Two data value comparators are implemented.

Bits 3:0 **ADCOMPPRS[3:0]**: Number of address comparator pairs
0x4: Four address comparator pairs are implemented.

### ETM trigger register (ETM_TRIGGER)

Address offset: 0x008

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
...
0x0F: Single address comparator 16
0x10: Address range comparator 1
...
0x17: Address range comparator 8
0x18: Instrumentation resource 1
0x19: Instrumentation resource 2
0x1A: Instrumentation resource 3
0x1B: Instrumentation resource 4
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
...
0x27: Embedded-ICE watchpoint comparators 8 (from DWT)
0x40: Counter 1 at zero
0x41: Counter 2 at zero
0x42: Counter 3 at zero
0x43: Counter 4 at zero
0x50: Sequencer in states 1
0x51: Sequencer in states 2
0x52: Sequencer in states 3
0x58: Context ID comparator 1
0x5B: VMID comparator
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x62: External inputs 3
0x63: External inputs 4
0x6D: Processor is in non-secure state
0x6E: Trace prohibited by processor
0x6F: Hard-wired input, always true
Others: Reserved

### ETM status register (ETM_SR)

| | | | | | | | | | | | | rw | rw | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **TRIG**: Trigger flag

Set when the trigger occurs, and prevents the trigger from being output until the ETM is programmed again.

Bit 2 **STSTPRESSTAT**: Trigger start/stop resource status

Holds the current status of the trace start/stop resource. If set to 1, it indicates that a trace on address has been matched, without a corresponding trace off address match.

Bit 1 **PROGBIT**: Programming bit value (read-only)

The current effective value of the ETM Programming bit, bit [10] of the ETM_CR. Set the programming bit to 1 and wait for this bit to go to 1 before programming the ETM.
This bit remains at 0 until the FIFO is empty, or if OS lock is set in the ETM_OSLSR register.

Bit 0 **UNTRCDOVFL**: Untraced overflow (read-only)

If set to 1, there is an overflow that has not yet been traced. This bit is cleared to 0 when trace is restarted, or when the ETM power-down bit (bit [0] of the ETM_CR register) is set to 1.

### ETM configuration register (ETM_SCR)

Address offset: 0x014

Reset value: 0x0002 0D09

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | r | r | r | r | r | r | r | | | | | | r | r | r |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **NOFTCHCOMP**: No fetch comparisons

1: Fetch comparisons are not implemented

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:12 **SUPPROC[2:0]**: Number of supported processors
0x0: One processor supported

Bit 11 **PMSUPP**: Port mode support
0: Current selected port mode is not supported
1: Current selected port mode is supported

Bit 10 **PSSUPP**: Port size support
0: Current selected port size is not supported
1: Current selected port size is supported

Bit 8 **FFSUPP**: FIFOFULL support
0: FIFOFULL is not supported

Bits 7:3 Reserved, must be kept at reset value.

Bits 9, 2, 1, 0 **MAXPS[3:0]**: Maximum ETM port size field
These bits indicate the maximum ETM port size supported.
0x4: Maximum port size = 4
Others: Reserved

### ETM trace enable start/stop control register (ETM_SSCR)

Address offset: 0x018

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| STARTADDRCOMPSEL[16:1] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **STOPADDRCOMPSEL[16:1]**: Stop address comparator select bits
When bit n is set to 1, it selects single address comparator n as stop address.

Bits 15:0 **STARTADDRCOMPSEL[16:1]**: Start address comparator select bits
When bit n is set to 1, it selects single address comparator n as start address.

### ETM trace enable control 2 register (ETM_TECR2)

Address offset: 0x01C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| FCN[1:0] | | RESOURCEB[6:0] | | | | | | | RESOURCEA[6:0] | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function
If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
...
0x0F: Single address comparator 16
0x10: Address range comparator 1
...
0x17: Address range comparator 8
0x18: Instrumentation resource 1
0x19: Instrumentation resource 2
0x1A: Instrumentation resource 3
0x1B: Instrumentation resource 4
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
...
0x27: Embedded-ICE watchpoint comparators 8 (from DWT)
0x40: Counter 1 at zero
0x41: Counter 2 at zero
0x42: Counter 3 at zero
0x43: Counter 4 at zero
0x50: Sequencer in states 1
0x51: Sequencer in states 2
0x52: Sequencer in states 3
0x58: Context ID comparator 1
0x5B: VMID comparator
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x62: External inputs 3
0x63: External inputs 4
0x6D: Processor is in non-secure state
0x6E: Trace prohibited by processor
0x6F: Hard-wired input, always true
Others: Reserved

### ETM trace enable control 1 register (ETM_TECR1)

Address offset: 0x024

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | TSSEN | INCEXCCTL | INCEXCMMDSEL[16:9] | | | | | | | |
| | | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| INCEXCMMDSEL[8:1] | | | | | | | | INCEXCADCOMPSEL[8:1] | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **TSSEN**: Trace start/stop trace enable control

0: Trace start/stop block does not control trace enable

1: Trace enable is controlled by the trace start/stop block

Bit 24 **INCEXCCTL**: Trace start/stop trace enable control

0: Include. The specified resources indicate the regions where tracing can occur. When outside this region tracing is prevented

1: Exclude. The resources specified in bits 23:0 and in the ETMTECR2 register indicate regions to be excluded from the trace. When outside an exclude region, tracing can occur.

Bits 23:8 **INCEXCMMDSEL[16:1]**: Memory map decode select bits for include/exclude control.

Not used, there are no memory map decoders

Bits 7:0 **INCEXCADCOMPSEL[8:1]**: Address comparator select bits for include/exclude control.

When bit n is set to 1, it selects address range comparator n for include/exclude control

### ETM FIFOFULL level register (ETM_FFLR)

Address offset: 0x028

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FIFOFULLLVL[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **FIFOFULLLVL[7:0]**: Threshold for FIFOFULL signal

The number of bytes left in the FIFO, below which the SuppressData signal is asserted. For example, setting this value to 15 causes data trace suppression, if enabled, when there are less than 15 free bytes in the FIFO.

### ETM view data event register (ETM_VDEVR)

Address offset: 0x030

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
...
0x0F: Single address comparator 16
0x10: Address range comparator 1
...
0x17: Address range comparator 8
0x18: Instrumentation resource 1
0x19: Instrumentation resource 2
0x1A: Instrumentation resource 3
0x1B: Instrumentation resource 4
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)

0x42: Counter 3 at zero
0x43: Counter 4 at zero
0x50: Sequencer in states 1
0x51: Sequencer in states 2
0x52: Sequencer in states 3
0x58: Context ID comparator 1
0x5B: VMID comparator
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x62: External inputs 3
0x63: External inputs 4
0x6D: Processor is in non-secure state
0x6E: Trace prohibited by processor
0x6F: Hard-wired input, always true
Others: Reserved

### ETM view data control 1 register (ETM_VDCR1)

Address offset: 0x034

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| VDEXSADCOMPSEL[16:1] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VDINCSADCOMPSEL[16:1] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **VDEXSADCOMPSEL[16:1]**: Single address comparator select bits for ViewData exclude control

When bit n is set to 1, it selects single address comparator n for exclude control.

Bits 15:0 **VDINCSADCOMPSEL[16:1]**: Single address comparator select bits for ViewData include control

When bit n is set to 1, it selects single address comparator n for include control.

### ETM view data control 3 register (ETM_VDCR3)

Address offset: 0x03C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EXCONLY |
| | | | | | | | | | | | | | | | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VDEXCADCOMPSEL[8:1] | | | | | | | | VDINCADCOMPSEL[8:1] | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **EXCONLY**: Exclude only

0: Mixed mode. ViewData operates in a mixed mode, and both include and exclude resources can be programmed

1: Exclude-only mode. ViewData is programmed onlry in an excluding mode. If none of the excluding resources match, tracing can occur

Bits 15:8 **VDEXCADCOMPSEL[8:1]**: Address range comparator select bits for ViewData exclude control

When bit n is set to 1, it selects address range comparator n for exclude control.

Bits 7:0 **VDINCADCOMPSEL[8:1]**: Address range comparator select bits for ViewData include control

When bit n is set to 1, it selects single address comparator n for include control.

### ETM address comparator value x register (ETM_ACVRx)

Address offset: 0x040 + 0x4 * (x - 1), (x = 1 to 8)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ADDRESS[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| ADDRESS[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ADDRESS[31:0]**: Address for comparison

### ETM address comparator type x register (ETM_ACTRx)

Address offset: 0x080 + 0x4 * (x - 1), (x = 1 to 8)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VMID COMP | HYP MODE | STMODE[3:0] | | | | CTXTIDCOMP [1:0] | | EXACT MATCH | DCOMP[1:0] | | COMPACCSIZE [1:0] | | ACCTYPE[2:0] | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **VMIDCOMP**: Virtual machine ID (VMID) comparison enable

A value of 1 means that the address comparator matches only if the current VMID matches the value stored in the ETM_VMIDCVR register

Bit 14 **HYPMODE**: Hyp mode comparison enable

A value of 1 means that the address comparator also matches if the processor is operating in Hyp mode

Bits 13:10 **STMODE[3:0]**: State and mode comparison control

Bits [3,1] control non-secure state comparison. Bits [2,0] control secure state comparison.
X0X0: Match in all modes in secure state
X0X1: Do not match in any modes in secure state
X1X0: Match in all modes except User mode in secure state
X1X1: Match only in User mode in secure state
0X0X: Match in all modes in non-secure state
0X1X: Do not match in any modes in non-secure state
1X0X: Match in all modes except User mode in non-secure state
1X1X: Match only in User mode in non-secure state

Bits 9:8 **CTXTIDCOMP[1:0]**: Context ID comparator control.
- 0: Ignore context ID comparator
- 1: Address comparator matches only if context ID comparator value 1 matches
- 2: Address comparator matches only if context ID comparator value 2 matches
- 3: Address comparator matches only if context ID comparator value 3 matches

Bit 7 **EXACTMATCH**: Exact match
- 0: Comparator matches even for cancelled instructions, data transfer aborts or failed stores
- 1: Comparator does not match for cancelled instructions, data transfer aborts or failed stores

Bits 6:5 **DCOMP[1:0]**: Data value comparison control.
- 0: No data value comparison is made
- 1: Comparator can match only if data value matches
- 2: Reserved
- 3: Comparator can match only if data value does not match

Bits 4:3 **COMPACCSIZE[1:0]**: Comparison access size.
- 0: Java instruction or byte data
- 1: Thumb instruction or halfword data
- 2: Reserved
- 3: Arm instruction or word data

Bits 2:0 **ACCTYPE[2:0]**: Access type
- 0: Instruction fetch (not supported)
- 1: Instruction execute
- 2: Instruction executed and passed condition code test
- 3: Instruction executed and failed condition code test
- 4: Data load or store
- 5: Data load
- 6: Data store
- 7: Reserved

### ETM data comparator value x register (ETM_DCVRx)

Address offset: 0x0C0 + 0x4 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DATA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: Data value for comparison

### ETM data comparator mask x register (ETM_DCMRx)

Address offset: 0x100 + 0x4 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| MASK[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MASK[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MASK[31:0]**: Data mask

When a data mask bit is set to 1, the corresponding bit in the ETM_DCVRn register is disregarded in the comparison and must be set to zero

### ETM counter reload value x register (ETM_CNTRLDVRx)

Address offset: 0x140 + 0x4 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| INITIALCOUNT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INITIALCOUNT[15:0]**: Initial count

Specifies the counter reload value.

### ETM counter enable x register (ETM_CNTENRx)

Address offset: 0x150 + 0x4 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FCN[2] |
| | | | | | | | | | | | | | | | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| FCN[1:0] | | RESOURCEB[6:0] | | | | | | | RESOURCEA[6:0] | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
...
0x0F: Single address comparator 16
0x10: Address range comparator 1
...
0x17: Address range comparator 8
0x18: Instrumentation resource 1
0x19: Instrumentation resource 2
0x1A: Instrumentation resource 3
0x1B: Instrumentation resource 4
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
...
0x27: Embedded-ICE watchpoint comparators 8 (from DWT)
0x40: Counter 1 at zero
0x41: Counter 2 at zero
0x42: Counter 3 at zero
0x43: Counter 4 at zero
0x50: Sequencer in states 1
0x51: Sequencer in states 2
0x52: Sequencer in states 3
0x58: Context ID comparator 1
0x5B: VMID comparator
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x62: External inputs 3
0x63: External inputs 4
0x6D: Processor is in non-secure state
0x6E: Trace prohibited by processor
0x6F: Hard-wired input, always true
Others: Reserved

### ETM counter reload event x register (ETM_CNTRLDEVRx)

Address offset: 0x160 + 0x4 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

0x63: External inputs 4
0x6D: Processor is in non-secure state
0x6E: Trace prohibited by processor
0x6F: Hard-wired input, always true
Others: Reserved

### ETM current sequencer state register (ETM_SQR)

Address offset: 0x19C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SQSTATE[1:0] | |
| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **SQSTATE[1:0]**: Current sequencer state
0: state 1
1: state 2
2: state 3
3: Reserved

### ETM external output event x register (ETM_EXTOUTEVRx)

Address offset: 0x1A0 + 0x4 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FCN[2] |
| | | | | | | | | | | | | | | | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| FCN[1:0] | | RESOURCEB[6:0] | | | | | | | RESOURCEA[6:0] | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function
If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier
See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
...
0x0F: Single address comparator 16
0x10: Address range comparator 1
...
0x17: Address range comparator 8
0x18: Instrumentation resource 1
0x19: Instrumentation resource 2
0x1A: Instrumentation resource 3
0x1B: Instrumentation resource 4
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
...
0x27: Embedded-ICE watchpoint comparators 8 (from DWT)
0x40: Counter 1 at zero
0x41: Counter 2 at zero
0x42: Counter 3 at zero
0x43: Counter 4 at zero
0x50: Sequencer in states 1
0x51: Sequencer in states 2
0x52: Sequencer in states 3
0x58: Context ID comparator 1
0x5B: VMID comparator
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x62: External inputs 3
0x63: External inputs 4
0x6D: Processor is in non-secure state
0x6E: Trace prohibited by processor
0x6F: Hard-wired input, always true
Others: Reserved

### ETM context ID comparator value 1 register (ETM_CIDCVR1)

Address offset: 0x1B0

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CONTEXTID[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CONTEXTID[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **CONTEXTID[31:0]**: Context ID value for comparison

### ETM context ID comparator mask register (ETM_CIDCMR)

Address offset: 0x1BC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| MASK[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MASK[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MASK[31:0]**: Context ID mask

When a mask bit is set to 1, the corresponding bit in the ETM_CIDCVR1 register is disregarded in the comparison and must be set to zero

### ETM synchronization frequency register (ETM_SYNCFR)

Address offset: 0x1E0

Reset value: 0x0000 0400

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | FREQUENCY[11:0] | | | | | | | | | | | |
| | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **FREQUENCY[11:0]**: Synchronisation frequency.

This value is the time in bytes between synchronization points in the trace, used by ETM (the tools can start decompressing only at synchronization points).

### ETM ID register (ETM_IDR)

Address offset: 0x1E4

Reset value: 0x410C F250

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| IMPLEMENTER[7:0] | | | | | | | | Res. | Res. | Res. | BPENC | SECEXT | T32 | Res. | LDPC1ST |
| r | r | r | r | r | r | r | r | | | | r | r | r | | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PROCFAM[3:0] | | | | ARCHVMAJ[3:0] | | | | ARCHVMIN[3:0] | | | | REVISION[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:24 **IMPLEMENTER[7:0]**: Implementer code
0x41: Arm®

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **BPENC**: Branch packet encoding support
0: Supports the original branch packet encoding

Bit 19 **SECEXT**: Security extensions support
1: Supports security extensions

Bit 18 **T32:** 32-bit Thumb instruction tracing
1: Supports 32-bit Thumb instructions

Bit 17 Reserved, must be kept at reset value.

Bit 16 **LDPC1ST**: Load PC first
0: If an LSM load operation with the PC, PC is not loaded first in the list

Bits 15:12 **PROCFAM[3:0]**: Processor family
0xF: Processor family is not identified in this register

Bits 11:8 **ARCHVMAJ[3:0]**: Major ETM architecture version
0x2: Version 3.x

Bits 7:4 **ARCHVMIN[3:0]**: Minor ETM architecture version
0x5: Version x.5

Bits 3:0 **REVISION[3:0]**: Implementation revision
0x0: Revision r0p0

### ETM configuration code extension register (ETM_CCER)

Address offset: 0x1E8

Reset value: 0x3440 08F2

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| INSTRES[2:0] | | | DACOMPS | ARR | PMUEVENTREGS[7:0] | | | | | | | | EEISELS[2:0] | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **TSSIZE**: Timestamp size
1: 64 bits.

Bit 28 **TSENC**: Timestamp encoding
1: Timestamp is encoded as a natural binary number

Bit 27 **CNTFNC**: Counter function
0: Counter is a full function counter

Bit 26 **VIRTEXT**: Virtual extensions
1: Virtual extensions supported

Bits 25:23 Reserved, must be kept at reset value.

Bit 22 **TIMSTMP**: Timestamping
1: Timestamping supported

Bit 21 **ETMEIBCR**: EmbeddedICE behavior control implemented
0: Not implemented

Bit 20 **TSSUWP**: Trace start/stop uses Embedded ICE watchpoint inputs
0: No embeddedICE watchpoint inputs supported

Bits 19:16 **EMBICEWPS[3:0]**: Embedded ICE watchpoint inputs
0: No embeddedICE watchpoint inputs supported

Bits 15:13 **INSTRES[2:0]**: Instrumentation resources
0: None

Bit 12 **DACOMPS**: Data address comparison support
0: No data address comparisons are supported

Bit 11 **ARR**: Readable registers
1: All registers are readable

Bits 10:3 **PMUEVENTREGS[7:0]**: Number of PMU event registers available
0x1E: 30 registers

Bits 2:0 **EEISELS[2:0]**: Number of extended external input selectors
0x2: 2 selectors

### ETM extended external input selection register (ETM_EXTINSELR)

Address offset: 0x1EC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| FCN[1:0] | | RESOURCEB[6:0] | | | | | | | RESOURCEA[6:0] | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x00: Single address comparator 1
...
0x0F: Single address comparator 16
0x10: Address range comparator 1
...
0x17: Address range comparator 8
0x18: Instrumentation resource 1
0x19: Instrumentation resource 2
0x1A: Instrumentation resource 3
0x1B: Instrumentation resource 4
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
...
0x27: Embedded-ICE watchpoint comparators 8 (from DWT)
0x40: Counter 1 at zero
0x41: Counter 2 at zero
0x42: Counter 3 at zero
0x43: Counter 4 at zero
0x50: Sequencer in states 1
0x51: Sequencer in states 2
0x52: Sequencer in states 3
0x58: Context ID comparator 1
0x5B: VMID comparator
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x62: External inputs 3
0x63: External inputs 4
0x6D: Processor is in non-secure state
0x6E: Trace prohibited by processor
0x6F: Hard-wired input, always true
Others: Reserved

### ETM auxiliary control register (ETM_AUXCR)

Address offset: 0x1FC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DPKTTRCDIS | TSPKTGENSUP | DNFOVFL |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DPKTTRCDIS**: Disable tracing of data packets
0: Not disabled
1: Disabled

Bit 1 **TSPKTGENSUP**: Suppress generation of timestamp packets
0: Do not suppress
1: Suppress generation of timestamp packets as the result of executing an ISB instruction

Bit 0 **DNFOVFL**: Do not force FIFO overflow
0: Force FIFO overflow if a periodic synchronisation has not been output for two full synchronisation periods
1: Do not force FIFO overflow

### ETM trace ID register (ETM_TRACEIDR)

Address offset: 0x200

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRACEID[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRACEID[7:0]**: Trace ID to output onto the trace bus
This should be programmed with a unique value to differentiate it from other trace sources in the system.

### ETM ID 2 register (ETM_IDR2)

Address offset: 0x208

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SWPTO | RFETO |
| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SWPTO**: SWP or SWPB instruction order
Identifies the order for a SWP or SWPB instruction.
0: The Load transfer is traced before the Store transfer

Bit 0 **RFETO**: RFE instruction order
Identifies the order for a RFE instruction.
0: The PC transfer is traced before the CPSR transfer

### ETM VMID comparator value register (ETM_VMIDCVR)

Address offset: 0x240

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VMID[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **VMID[7:0]**: Virtual machine ID for comparison with current one

### ETM OS lock access register (ETM_OSLAR)

Address offset: 0x300

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| KEYVALUE[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| KEYVALUE[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **KEYVALUE[31:0]**: ETM register lock access
0xC5ACCE55: Disable access
Other values: Enable access

### ETM OS lock status register (ETM_OSLSR)

Address offset: 0x304

Reset value: 0x0000 000A

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ETMOSLAR | NTT | DBGRLKED | DBGRLKSUP |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ETMOSLAR**: ETM OS lock access register implemented
1: Implemented

Bit 2 **NTT**: 32-bit access required
0: 32-bit accesses are required to operate the ETM_OSLAR

Bit 1 **DBGRLKED**: Registers locked
0: ETM registers are not locked
1: ETM registers are locked. Any access will return a slave-generated error response

Bit 0 **DBGRLKSUP**: ETM power down support
0: Full support

### ETM OS save & restore register (ETM_OSSRR)

Address offset: 0x308

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| VALUE[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VALUE[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **VALUE[31:0]**: OS save/restore register value
On first read after locking the registers, this register contains the number of additional accesses required to save or restore the ETM registers.
Subsequent reads during an OS save return the contents of each register for storing in memory. During an OS restore, subsequent writes load the written value to each register in turn.

### ETM device power-down control register (ETM_PDCR)

Address offset: 0x310

Reset value: 0x0000 0008

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | rw | | | |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **TRCPWREN**: Trace power enable

1: Power to the domain containing the trace registers must be provided.

Bits 2:0 Reserved, must be kept at reset value.

### ETM device power-down status register (ETM_PDSR)

Address offset: 0x314

Reset value: 0x0000 0023

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OSLOC KST | Res. | Res. | Res. | STKYR EGST | ETMP WRD |
| | | | | | | | | | | r | | | | r | r |

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **OSLOCKST**: OS lock status

The value of this bit is the same as the value of bit[1] of the ETM_OSLSR.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **STKYREGST**: Sticky register state

0: Indicates this register has been read after a reset

1: Indicates this register has never been read after a reset

Bit 0 **ETMPWRD**: ETM powered

1: ETM powered; trace registers can be accessed.

### ETM claim tag set register (ETM_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 00FF

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CLAIMSET[7:0]**: Set claim tag bits

Write:
00000000: No effect
xxxxxxx1: Set bit 0
xxxxxx1x: Set bit 1
xxxxx1xx: Set bit 2
...etc.
Read:
0xFF: Indicates there are eight bits in claim tag

### ETM claim tag clear register (ETM_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CLAIMCLR[7:0]**: Reset claim tag bits

Write:
00000000: No effect
xxxxxxx1: Clear bit 0
xxxxxx1x: Clear bit 1
xxxxx1xx: Clear bit 2
xxxx1xxx: Clear bit 3
...etc.
Read: Returns current value of claim tag

### ETM lock access register (ETM_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: ETM register write access

Enables write access to some ETM registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

### ETM lock status register (ETM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCK TYPE | LOCK GRANT | LOCK EXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the ETM_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted

1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism

The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists

1: Lock control mechanism is implemented

### ETM authentication status register (ETM_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
- 0x: Unused
- 10: Secure non-invasive debug disabled
- 11: Secure non-invasive debug enabled

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
- 00: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
- 0x: Unused
- 10: Non-secure non-invasive debug disabled
- 11: Non-secure non-invasive debug enabled

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
- 00: Not implemented

### ETM Coresight device configuration register (ETM_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DEVICEID[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DEVICEID[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **DEVICEID[31:0]**: Device configuration
- 0x0: No configuration information

### ETM CoreSight device type register (ETM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0013

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SUBTYPE[3:0] | | | | MAJORTYPE[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: Device sub-type identifier
0x1: Processor trace

Bits 3:0 **MAJORTYPE[3:0]**: Device main type identifier
0x3: Trace source

### ETM CoreSight peripheral identity register 4 (ETM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SIZE[3:0] | | | | JEP106CON[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: Register file size
0x0: Register file occupies a single 4 Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code
0x4: Arm® JEDEC code

### ETM CoreSight peripheral identity register 0 (ETM_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0056

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PARTNUM[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PARTNUM[7:0]**: Part number field, bits [7:0]
0x56: ETM part number

### ETM CoreSight peripheral identity register 1 (ETM_PIDR1)

Address offset: 0xFE4

Reset value: 0x0000 00B9

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 66.11.4 Cross trigger interface (CTI)

See *Section 66.10.3*.

## 66.12 Cortex®-M4 debug features

The Cortex®-M4 subsystem integrates the following CoreSight™ components:

- CM4 ROM table
- CM4 System Control Space (SCS)
- Breakpoint Unit (FPB)
- Data Watchpoint and Trace Unit (DWT)
- Instrumentation Trace Macrocell (ITM)
- Embedded Trace Macrocell (ETM)
- Cross Trigger Interface (CTI)

These components are accessible by the debugger via the Cortex®-M4 AHB-AP.

### 66.12.1 ROM tables

The ROM table is a CoreSight™ component that contains the base addresses of all the CoreSight™ debug components accessible via the AHB-AP. These tables allow a debugger to discover the topology of the CoreSight™ system automatically.

There is one ROM table in the Cortex®-M4 subsystem. This table is pointed to by the BASE register in the Cortex®-M4 AHB-AP. It contains the base address pointer for the System Control Space registers, which allow the debugger to identify the CPU core, as well as for the FPB, DWT, ITM, ETM and CTI.

The Cortex®-M4 CPU ROM table described in *Table 579* occupies a 4-Kbyte, 32-bit wide chunk of address space, from 0xE00F F000 to 0xE00F FFFC.

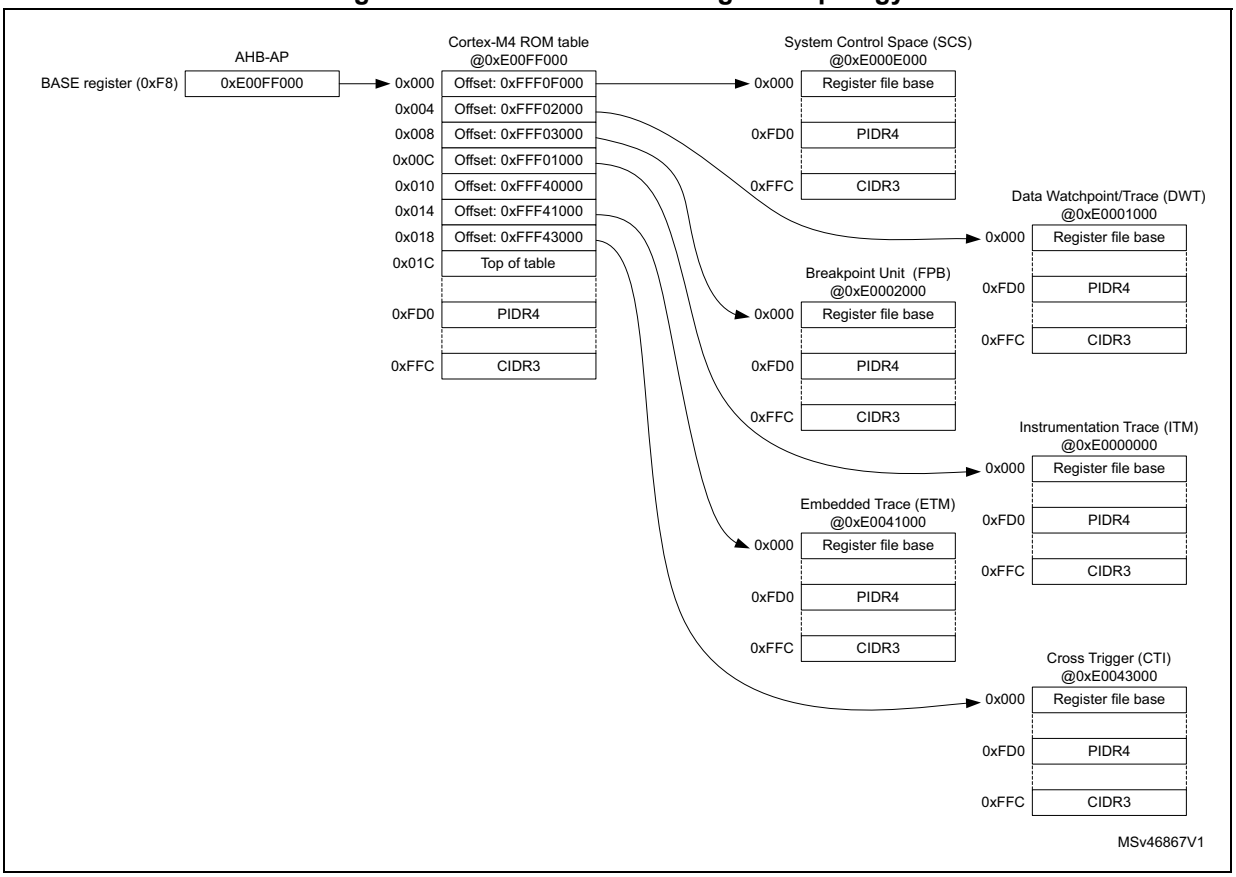
**Table 579. Cortex®-M4 CPU ROM table**

| Address in ROM table | Component name | Component base address | Component address offset | Size | Entry |
|---|---|---|---|---|---|
| 0xE00F F000 | SCS | 0xE000 E000 | 0xFFF0 F000 | 4 Kbyte | 0xFFF0 F003 |
| 0xE00F F004 | DWT | 0xE000 1000 | 0xFFF0 2000 | 4 Kbyte | 0xFFF0 2003 |
| 0xE00F F008 | FPB | 0xE000 2000 | 0xFFF0 3000 | 4 Kbyte | 0xFFF0 3003 |
| 0xE00F F00C | ITM | 0xE000 0000 | 0xFFF0 1000 | 4 Kbyte | 0xFFF01 003 |
| 0xE00F F010 | TPIU(1) | 0xE004 0000 | 0xFFF4 1000 | 4 Kbyte | 0xFFF4 1002 |
| 0xE00F F014 | ETM | 0xE004 1000 | 0xFFF4 2000 | 4 Kbyte | 0xFFF4 2003 |
| 0xE00F E018 | CTI | 0xE004 3000 | 0xFFF4 5000 | 4 Kbyte | 0xFFF4 5003 |
| 0xE00F F01C | Top of table | - | - | - | 0x0000 0000 |
| 0xE00F F020 to 0xE00F FFC8 | Reserved | - | - | - | 0x0000 0000 |
| 0xE00F FFCC to 0xE00F FFFC | ROM table registers | - | - | - | See *Table 580* |

1. The TPIU is included in this table by default, but bit 0 is reset to indicate that it is not present.

The topology for the CoreSight™ components in the Cortex®-M4 subsystem is shown in *Figure 823*.

**Figure 823. Cortex®-M4 CoreSight™ topology**



## Cortex®-M4 ROM registers

### CM4ROM memory type register (CM4ROM_MEMTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.12.2 Data watchpoint and trace unit (DWT)

The DWT provides four comparators that can be used as:

- Watchpoint
- ETM trigger
- PC sampling trigger
- Data address sampling trigger
- Data comparator (comparator 1 only)
- Clock cycle counter comparator (comparator 0 only)

It also contains counters for:

- Clock cycles
- Folded instructions
- Load Store Unit (LSU) operations
- Sleep cycles
- Number of cycles per instruction
- Interrupt overhead

A DWT comparator compares one of the following with the value held in its DWT_COMP register:

a) a data address
b) an instruction address
c) a data value
d) the cycle count value, for comparator 0 only.

For address matching, the comparator can use a mask, so it matches a range of addresses.

On a successful match, the comparator generates one of the following:

- One or more DWT Data trace packets, containing one or more of:
  a) the address of the instruction that caused a data access
  b) an address offset, bits[15:0] of the data access address
  c) the matched data value
- A watchpoint debug event, on either the PC value or the accessed data address
- A CMPMATCH[N] event, that signals the match outside the DWT unit

A watchpoint debug event either generates a Debug Monitor exception, or causes the processor to halt execution and enter Debug state.

For more details on how to use the DWT, refer to the *Arm®v7-M Architecture Reference Manual [5]*.

### Data watchpoint and trace unit registers

The Cortex®-M4 DWT registers are located at address range 0xE0001000 to 0xE0001FFC.

### DWT control register (DWT_CTRL)

Address offset: 0x000

Reset value: 0x4000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:28 **NUMCOMP[3:0]**: number of comparators implemented
0x4: four comparators

Bit 27 **NOTRCPKT**: trace sampling and exception tracing support
0x0: supported

Bit 26 **NOEXTTRIG**: external match signal, CMPMATCH support
0x0: supported

Bit 25 **NOCYCCNT**: cycle counter support
0x0: supported

Bit 24 **NOPRFCNT**: profiling counter support
0x0: supported

Bit 23 Reserved, must be kept at reset value.

Bit 22 **CYCEVTENA**: enable for POSTCNT underflow event counter packet generation
0x0: disabled
0x1: enabled

Bit 21 **FOLDEVTENA**: enable for folded instruction counter overflow event generation
0x0: disabled
0x1: enabled

Bit 20 **LSUEVTENA**: enable for LSU counter overflow event generation
0x0: disabled
0x1: enabled

Bit 19 **SLEEPEVTENA**: enable for Sleep mode counter overflow event generation
0x0: disabled
0x1: enabled

Bit 18 **EXCEVTENA**: enable for exception overhead counter overflow event generation
0x0: disabled
0x1: enabled

Bit 17 **CPIEVTENA**: enable for CPI counter overflow event generation
0x0: disabled
0x1: enabled

Bit 16 **EXCTRCENA**: enable for exception trace generation
0x0: disabled
0x1: enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PCSAMPLENA**: PC sample enable
Enables the use of the POSTCNT counter as a timer for periodic PC sample packet generation.
0x0: disabled
0x1: enabled

Bits 11:10 **SYNCTAP[1:0]**: synchronization tap position
Selects the position of the synchronization packet counter tap on the CYCCNT counter. This determines the synchronization packet rate.
0x0: disabled. No synchronization packets
0x1: tap at CYCCNT[24]
0x2: tap at CYCCNT[26]
0x3: tap at CYCCNT[28]

Bit 9 **CYCTAP**: CYCCNT tap position
Selects the position of the POSTCNT tap on the CYCCNT counter.
0x0: tap at CYCCNT[6]
0x1: tap at CYCCNT[10]

Bits 8:5 **POSTINIT[3:0]**: POSTCNT counter initial value
Writes to this field are ignored if POSTCNT counter is enabled (meaning that CYCEVTENA or PCSAMPLENA must be reset prior to writing POSTINIT).

Bits 4:1 **POSTPRESET[3:0]**: POSTCNT counter reload value

Bit 0 **CYCCNTENA**: CYCCNT counter enable
0x0: disabled
0x1: enabled

### DWT cycle count register (DWT_CYCCNT)

Address offset: 0x004

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CPICNT[7:0]**: CPI counter

Counts additional cycles required to execute multi-cycle instructions, except those recorded by DWT_LSUCNT, and counts any instruction fetch stalls.

### DWT exception count register (DWT_EXCCNT)

Address offset: 0x00C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EXCCNT[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **EXCCNT[7:0]**: exception overhead cycle counter

Counts the number of cycles spent in exception processing.

### DWT Sleep mode count register (DWT_SLPCNT)

Address offset: 0x010

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SLEEPCNT[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **SLEEPCNT[7:0]**: sleep mode cycle counter

Counts the number of cycles spent in Sleep mode (WFI, WFE, sleep-on-exit).

### DWT LSU count register (DWT_LSUCNT)

Address offset: 0x014

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LSUCNT[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LSUCNT[7:0]**: load store counter
Counts the additional cycles required to execute load and store instructions.

### DWT fold count register (DWT_FOLDCNT)

Address offset: 0x018

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FOLDCNT[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **FOLDCNT[7:0]**: folded instruction counter
Increments on each instruction that takes 0 cycles.

### DWT program counter sample register (DWT_PCSR)

Address offset: 0x01C

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| EIASAMPLE[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EIASAMPLE[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **EIASAMPLE[31:0]**: executed instruction address sample value
Samples the current value of the program counter.

### DWT comparator x registers (DWT_COMPx)

Address offset: 0x020 + 0x010 * x, (x = 0 to 3)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| COMP[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| COMP[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **COMP[31:0]**: reference value for comparison

### DWT comparator mask x registers (DWT_MASKx)

Address offset: 0x024 + 0x010 * x,(x = 0 to 3)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MASK[4:0] | | | | |
| | | | | | | | | | | | rw | rw | rw | rw | rw |

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **MASK[4:0]**: comparator mask size

Provides the size of the ignore mask applied to the access address for address range matching by comparator x. A debugger can write 11111 to this field and then read the register back to determine the maximum mask size supported.

### DWT comparator function x registers (DWT_FUNCTx)

Address offset: 0x028 + 0x010 * x, (x = 0 to 3)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | MATCHED | Res. | Res. | Res. | Res. | DATAVADDR1[3:0] | | | |
| | | | | | | | r | | | | | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DATAVADDR0[3:0] | | | | DATAVSIZE[1:0] | | LNK1ENA | DATAVMATCH | CYCMATCH | Res. | EMITRANGE | Res. | FUNCTION[3:0] | | | |
| rw | rw | rw | rw | rw | rw | r | rw | rw | | rw | | rw | rw | rw | rw |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **MATCHED**: comparator match

Indicates if a comparator match has occurred since the register was last read.
0: no match
1: match occurred

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **DATAVADDR1[3:0]**: second comparator number

When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a second comparator to use for linked address comparison.

Bits 15:12 **DATAVADDR0[3:0]**: comparator number

When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a comparator to use for linked address comparison.

Bits 11:10 **DATAVSIZE[1:0]**: data comparison size

For data value matching, specifies the size of the required data comparison.
0x0: byte
0x1: half word
0x2: word
0x3: reserved

Bit 9 **LNK1ENA**: second linked comparator support

Indicates whether use of a second linked comparator is supported.
0x1: supported

Bit 8 **DATAVMATCH**: cycle comparison enable

0x0: performs address comparison
0x1: performs data value comparison

Bit 7 **CYCMATCH**: cycle count comparison enable

Enables cycle count comparison on comparator 0. This field is reserved for other comparators.
0x0: no cycle count comparison
0x1: compares DWT_COMP0 with the cycle counter, DWT_CYCCNT

Bit 6 Reserved, must be kept at reset value.

Bit 5 **EMITRANGE**: address offset data trace enable

Enables generation of data trace address offset packets (containing data address bits 0 to 15).
0x0: disabled
0x1: enabled

Bit 4 Reserved, must be kept at reset value.

Bits 3:0 **FUNCTION[3:0]**: comparator match action

Selects the action to take on comparator match. The meaning of this bit field depends on the setting of the DATAVMATCH and CYCMATCH fields. See *[5]*.

### DWT CoreSight peripheral identity register 4 (DWT_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SIZE[3:0] | | | | JEP106CON[3:0] | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: register file size
0x0: register file occupies a single 4-Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code
0x4: Arm® JEDEC code

### DWT CoreSight peripheral identity register 0 (DWT_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0002

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **REVISION[3:0]**: component revision number
0x3: r0p4

Bit 3 **JEDEC**: JEDEC assigned value
0x1: designer ID specified by JEDEC

Bits 2:0 **JEP106ID[6:4]**: JEP106 identity code bits [6:4]
0x3: Arm® JEDEC code

### DWT CoreSight peripheral identity register 3 (DWT_PIDR3)

Address offset: 0xFEC

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.12.3 Instrumentation trace macrocell (ITM)

The ITM generates trace information as packets. There are four sources that can generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

1. Software trace.

   Software can write directly to any of 32 x 32-bit ITM stimulus registers to generate packets. The permission level for each port can be programmed. When software writes to an enabled stimulus port, the ITM combines the identity of the port, the size of the write access, and the data written, into a packet that it writes to a FIFO. The ITM outputs packets from the FIFO onto the trace bus. Reading a stimulus port register returns the status of the stimulus register (empty or pending) in bit 0.

2. Hardware trace.

   The DWT generates trace packets in response to a data trace event, a PC sample or a performance profiling counter wraparound. The ITM outputs these packets on the trace bus.

3. Local timestamping.

   The ITM contains a 21-bit counter clocked by the (pre-divided) processor clock. The counter value is output in a timestamp packet on the trace bus. The counter is reset to zero every time a timestamp packet is generated. The timestamps thus indicate the time elapsed since the previous timestamp packet.

4. Global system timestamping.

   Timestamps can also be generated using the system-wide 64-bit count value coming from the Timestamp Generator component.

### Instrumentation trace macrocell registers

The ITM registers are located at address range 0xE0000000 to 0xE0000FFC.

### ITM stimulus x registers (ITM_STIMx)

Address offset: 0x000 + 0x004 *x,(x = 0 to 31)

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| STIMULUS[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **STIMULUS[31:0]**: stimulus port indicator

Write data is output on the trace bus as a software event packet. When reading, bit 0 is a FIFOREADY indicator.

0: stimulus port buffer is full (or port is disabled)

1: stimulus port can accept new write data

### ITM trace enable register (ITM_TER)

Address offset: 0x080

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| STIMENA[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| STIMENA[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **STIMENA[31:0]**: stimulus port enable

Each bit x (0:32) enables the stimulus port associated with the ITM_STIMx register.

0: port disabled

1: port enabled

### ITM trace privilege register (ITM_TPR)

Address offset: 0xE00

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| PRIVMASK[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PRIVMASK[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **PRIVMASK[31:0]**: unprivileged access enable

Enables unprivileged access to ITM stimulus ports. Each bit controls eight stimulus ports.

XXX0: unprivileged access permitted on ports 0 to 7

XXX1: only privileged access permitted on ports 0 to 7

XX0X: unprivileged access permitted on ports 8 to 15

XX1X: only privileged access permitted on ports 8 to 15

X0XX: unprivileged access permitted on ports 16 to 23

X1XX: only privileged access permitted on ports 16 to 23

0XXX: unprivileged access permitted on ports 24 to 31

1XXX: only privileged access permitted on ports 24 to 31

### ITM trace control register (ITM_TCR)

Address offset: 0xE80

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BUSY | TRACEBUSID[6:0] | | | | | | |
| | | | | | | | | r | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | | | | rw | rw | rw | rw | | | | r | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **BUSY**: ITM busy

Indicates whether the ITM is currently processing events.

0: not busy

1: busy

Bits 22:16 **TRACEBUSID[6:0]:** identifier for multi-source trace stream formatting

If multi-source trace is in use, the debugger must write a non-zero value to this field.

Different IDs must be used for each trace source in the system.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:10 **GTSFREQ[1:0]:** global timestamp frequency

Defines how often the ITM generates a global timestamp, based on the global timestamp clock frequency, or disables generation of global timestamps.

The possible values are:

0x0: disable generation of global timestamps

0x1: generate timestamp request whenever the ITM detects a change in global timestamp counter bits [47:7]. This is approximately every 128 cycles.

0x2: generate timestamp request whenever the ITM detects a change in global timestamp counter bits [47:13]. This is approximately every 8192 cycles.

0x3: generate a timestamp after every packet, if the output FIFO is empty.

Bits 9:8 **TSPRESCALE[1:0]**: local timestamp prescaler

This field is used with the trace packet reference clock.

The possible values are:

0x0: no prescaling

0x1: divide by 4

0x2: divide by 16

0x3: divide by 64

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SWOENA**: Enables asynchronous clocking of the timestamp counter

0: timestamp counter uses processor clock

Bit 3 **TXENA**: Enables forwarding of hardware event packets from the DWT unit to the trace port
0: disabled
1: enabled

Bit 2 **SYNCENA**: synchronisation packet transmission enable
If a debugger sets this bit it must also configure the DWT_CTRL register SYNCTAP field in the DWT for the correct synchronisation speed.
0: disabled
1: enabled

Bit 1 **TSENA**: local timestamp generation enable
0: disabled
1: enabled

Bit 0 **ITMENA**: ITM enable
0: disabled
1: enabled

### ITM CoreSight peripheral identity register 4 (ITM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

## 66.12.4 Breakpoint unit (FPB)

The FPB allows hardware breakpoints to be set. It contains six comparators which monitor the instruction fetch address and two literal address comparators. If a match occurs, the address is remapped to an address in system memory, defined by the FPB_REMAP register plus an offset corresponding to the matching comparator. Alternatively, the instruction comparators can be configured to generate a breakpoint instruction.

### Breakpoint unit registers

The Cortex®-M4 FPB registers are located at address range 0xE000 2000 to 0xE000 2FFC.

### FPB control register (FPB_CTRL)

Address offset: 0x000

Reset value: 0x0000 0080

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | r | r | r | r | r | r | r | r | r | r | r | | | rw | rw |

Bits 31:15 Reserved, must be kept at reset value.

Bits 11:8 **NUM_LIT[3:0]**: number of literal address comparators supported
0x2: two literal comparators supported.

Bits 14, 13, 12, 7, 6, 5, 4 **NUM_CODE[6:0]**: number of instruction address comparators supported
0x6: 6 instruction comparators supported

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **KEY**: write protect key
A write to FPB_CTRL register will be ignored if this bit is not set to 1.

Bit 0 **ENABLE**: FPB enable
0x0: disable
0x1: enable

### FPB remap register (FPB_REMAP)

Address offset: 0x004

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | RMPSPT | REMAP[23:11] | | | | | | | | | | | | |
| | | r | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| REMAP[10:0] | | | | | | | | | | | Res. | Res. | Res. | Res. | Res. |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | | | |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **RMPSPT**: flash patch remap support

Indicates whether flash patch remap is supported.

0x1: remapping supported.

Bits 28:5 **REMAP**[23:0]: remap target address

Bits [28:5] of the base address in SRAM to which the FPB remaps the address. The remap base address must be aligned to the number of words required to support the implemented comparators, that is to (NUM_CODE + NUM_LIT) words, with a minimum alignment of 8 words. Because remap is into the SRAM memory region, 0x2000 0000-0x3FFF FFFF, bits [31:29] of the remap address are 001.

Bits 4:0 Reserved, must be kept at reset value.

### FPB comparator x registers (FPB_COMPx)

Address offset: 0x008 + 0x004 * x, (x = 0 to 7)

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| REPLACE[1:0] | | Res. | COMP[26:14] | | | | | | | | | | | | |
| rw | rw | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| COMP[13:0] | | | | | | | | | | | | | | Res. | ENABLE |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw |

Bits 31:30 **REPLACE[1:0]**: behavior at comparison match

Defines the behavior when a match occurs between the COMP field and the instruction fetch/literal address(1).

0x0: remap to address defined in FPB_REMAP register, plus 4n, where n is the comparator number.

0x1: breakpoint on lower half-word, upper half-word is unaffected

0x2: breakpoint on upper half-word, lower half-word is unaffected

0x3: breakpoint on both upper and lower half-words

Bit 29 Reserved, must be kept at reset value.

Bits 28:2 **COMP[26:0]**: value to compare with address bits 28:2 of accesses to instruction code memory (0x0000 0000 to 0x1FFF FFFF). If a match occurs, the action to be taken is defined by the REPLACE field.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: comparator enable

The comparator is only enabled if both this bit and the FPB ENABLE bit in the FPB_CTRL register are set.

0: disabled

1: enabled

1. FPB_COMP(0:5) correspond to the instruction address comparators. FPB_COMP(6:7) correspond to the literal address comparators.

### FPB CoreSight peripheral identity register 4 (FPB_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 66.12.5 Embedded trace macrocell (ETM)

The Cortex®-M4 ETM is a CoreSight™ component closely coupled to the CPU. The ETM generates trace packets that allow the execution of the Cortex®-M4 core to be traced. In STM32MP15, the ETM is configured for instruction trace only, meaning that data accesses are not included in the trace information.

The ETM receives information from the CPU over the processor trace interface, including:

- The number of instructions executed in the same cycle
- Changes in program flow
- The current processor instruction state
- The addresses of memory locations accessed by load and store instructions
- The type, direction and size of a transfer
- Condition code information
- Exception information
- Wait for interrupt state information

For more information, refer to the *Arm® CoreSight™ ETM™-Cortex®-M4 technical reference manual [7]*.

### Embedded trace macrocell registers

The ETM registers are accessed by the debugger via the Cortex®-M4 AHB-AP, at address range 0xE004 1000 to 0xE004 1FFC.

### Cortex-M4 ETM registers

### ETM control register (M4_ETM_CR)

Address offset: 0x000

Reset value: 0x0000 0411

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | TSEN | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | rw | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | ETMEN | PROG | DBRQ | BO | STALL | Res. | Res. | Res. | Res. | Res. | Res. | PDN |
| | | | | rw | rw | rw | rw | rw | | | | | | | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TSEN**: Timestamp enable
0: Timestamping disabled
1: Timestamping enabled

Bits 26:12 Reserved, must be kept at reset value.

Bit 11 **ETMEN**: ETM enable
0: Trace output disabled
1: Trace output enabled

Bit 10 **PROG**: ETM programming
This bit must be set to 1 before programming the ETM. Tracing is prevented while this bit is set to 1.
0: ETM operational
1: ETM in programming state

Bit 9 **DBRQ**: Debug request.

When set to 1 and the trigger event occurs, the ETMDBGRQ output is asserted until HALTED is observed. This enables the Arm® processor to be forced into Debug state.

Bit 8 **BO**: Branch output

When set to 1 all branch addresses are output, even if the branch was because of a direct branch instruction. Setting this bit enables reconstruction of the program flow without having access to the memory image of the code being executed.

When this bit is set to 1, more trace data is generated, and this may affect the performance of the trace system. Information about the execution of a branch is traced regardless of the state of this bit.

Bit 7 **STALL**: Stall processor

The FIFOFULL output can be used to stall the processor to prevent overflow. The FIFOFULL output is only enabled when the stall processor bit is set to 1. When the bit is 0 the FIFOFULL output remains low at all times and the FIFO overflows if there are too many trace packets. Trace resumes without corruption once the FIFO has drained, if overflow does occur.

Bits 6:1 Reserved, must be kept at reset value.

Bit 0 **PDN**: ETM power down

This bit can be used by an implementation to control if the ETM is in a low power state. This bit must be cleared by the trace software tools at the beginning of a debug session.

When this bit is set to 1, writes to some registers and fields might be ignored. The following registers and fields are still write-accessible:

- ETMCR bit [0]
- ETMLAR
- ETMCLAIMSET register
- ETMCLAIMCLR register

When the ETMCR is written with this bit set to 1, bits other than bit [0] might be ignored.

### ETM configuration code register (M4_ETM_CCR)

Address offset: 0x004

Reset value: 0x8C80 2000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bit 31 **IDPRES**: ETM ID register present

1: ETMIDR register is present and defines the ETM architecture version in use

Bits 30:28 Reserved, must be kept at reset value.

Bit 27 **CPMAC**: Co-processor and memory access

1: Memory-mapped access to registers is supported

Bit 26 **TSPRES**: Trace start/stop block present

1: Trace start/stop block is present

Bits 25:24 **CIDCMP[1:0]**: Number of context ID comparators
0x0: Context ID comparators are not implemented.

Bit 23 **FFPRES**: FIFOFULL logic present
To use FIFOFULL the system must also support the function, as indicated by bit[8] of ETMSCR.

1: FIFOFULL logic is present in the ETM

Bits 22:20 **NEXTO[2:0]**: Number of external outputs
0x0: No external outputs are supported

Bits 19:17 **NEXTI[2:0]**: Number of external inputs
0x2: Two external inputs are supported

Bit 16 **SEQPRES**: Sequencer present
0: The sequencer is not present in the ETM.

Bits 15:13 **NCNT[2:0]**: Number of counters
0x1: One counter is implemented

Bits 12:8 **NMMDEC[4:0]**: Number of memory map decoders
0x0: No memory map decoder inputs are implemented.

Bits 7:4 **NDVCMP[3:0]**: Number of data value comparators
0x0: No data value comparators are implemented.

Bits 3:0 **NADCMP[3:0]**: Number of address comparator pairs
0x0: No address comparator pairs are implemented.

### ETM trigger register (M4_ETM_TRIGGER)

Address offset: 0x008

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.

0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
0x21: Embedded-ICE watchpoint comparators 2 (from DWT)
0x22: Embedded-ICE watchpoint comparators 3 (from DWT)
0x23: Embedded-ICE watchpoint comparators 4 (from DWT)
0x40: Counter 1 at zero
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x6F: Hard-wired input, always true
Others: Reserved

### ETM status register (M4_ETM_SR)

Address offset: 0x010

Reset value: 0x0000 0000

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **TRIGFL**: Trigger flag

Set when the trigger occurs, and prevents the trigger from being output until the ETM is programmed again.

Bit 2 **TSSRSTAT**: Trigger start/stop resource status

Holds the current status of the trace start/stop resource. If set to 1, it indicates that a trace on address has been matched, without a corresponding trace off address match.

Bit 1 **PROGVAL**: Programming bit value (read-only)

The current effective value of the ETM Programming bit, bit [10] of the M4_ETM_CR. Set the programming bit to 1 and wait for this bit to go to 1 before programming the ETM.
This bit remains at 0 until the FIFO is empty, or if OS lock is set in the M4_ETM_OSLSR register.

Bit 0 **UOVFL**: Untraced overflow (read-only)

If set to 1, there is an overflow that has not yet been traced. This bit is cleared to 0 when trace is restarted, or when the ETM power-down bit (bit [0] of the M4_ETM_CR register) is set to 1.

### ETM configuration register (M4_ETM_SCR)

Address offset: 0x014

Reset value: 0x0002 0D09

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | r | r | r | r | r | r | r | | | | | | r | r | r |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **NOFTCHCOMP**: No fetch comparisons

1: Fetch comparisons are not implemented

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:12 **NSUPPROC[2:0]**: Number of supported processors

0x0: One processor supported

Bit 11 **PORTMODESUP**: Port mode support

0: Current selected port mode is not supported
1: Current selected port mode is supported

Bit 10 **PORTSIZESUP**: Port size support

0: Current selected port size is not supported
1: Current selected port size is supported

Bit 8 **FFSUP**: FIFOFULL support
1: FIFOFULL is supported

Bits 7:3 Reserved, must be kept at reset value.

Bits 9, 2, 1, 0 **MAXPORTSIZE[3:0]**: Maximum ETM port size field
These bits indicate the maximum ETM port size supported.
0x1: Maximum port size = 1

### ETM trace enable event register (M4_ETM_TEEVR)

Address offset: 0x020

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
0x21: Embedded-ICE watchpoint comparators 2 (from DWT)
0x22: Embedded-ICE watchpoint comparators 3 (from DWT)
0x23: Embedded-ICE watchpoint comparators 4 (from DWT)
0x40: Counter 1 at zero
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x6F: Hard-wired input, always true
Others: Reserved

### ETM trace enable control 1 register (M4_ETM_TECR1)

Address offset: 0x024

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **ENONOFF**: Trace start/stop trace enable control
0: Trace start/stop block does not control trace enable
1: Trace enable is controlled by the trace start/stop block

Bits 24:0 Reserved, must be kept at reset value.

### ETM FIFOFULL level register (M4_ETM_FFLR)

Address offset: 0x028

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LEVEL[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LEVEL[7:0]**: Threshold for FIFOFULL signal

The number of bytes left in the FIFO, below which the FIFOFULL signal is asserted. For example, setting this value to 15 causes processor stalling, if enabled, when there are less than 15 free bytes in the FIFO.

### ETM counter reload value 1 register (M4_ETM_CNTRLDVR1)

Address offset: 0x140

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| INICNT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INICNT[15:0]**: Initial count

Specifies the counter reload value.

### ETM synchronization frequency register (M4_ETM_SYNCFR)

Address offset: 0x1E0

Reset value: 0x0000 0400

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | FREQUENCY[11:0] | | | | | | | | | | | |
| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **FREQUENCY[11:0]**: Distance of synchronization points

This value is the time in bytes between synchronization points in the trace, used by ETM (the tools can start decompressing only at synchronization points).

0x400: fixed synchronization packet generation every 1024 bytes of trace

### ETM ID register (M4_ETM_IDR)

Address offset: 0x1E4

Reset value: 0x4114 F250

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| DESIGNER[7:0] | | | | | | | | Res. | Res. | Res. | ABPE | SXSUPP | T32SUPP | Res. | LDPCF |
| r | r | r | r | r | r | r | r | | | | r | r | r | | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PROCFAM[3:0] | | | | ETMARCHMAJ[3:0] | | | | ETMARCHMIN[3:0] | | | | REVISION[3:0] | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:24 **DESIGNER[7:0]**: Implementer code

0x41: Arm®

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **ABPE**: Alternative ranch packet encoding

1: ABPE is implemented.

Bit 19 **SXSUPP**: Security extensions support

0: ETM behaves as if the processor is in secure mode at all times

Bit 18 **T32SUPP**: 32-bit Thumb instruction tracing

1: 32-bit Thumb instructions are traced as single instructions

Bit 17 Reserved, must be kept at reset value.

Bit 16 **LDPCF**: Load PC first

0: Data tracing is not supported

Bits 15:12 **PROCFAM[3:0]**: Processor family

0xF: Processor family is not identified in this register

Bits 11:8 **ETMARCHMAJ[3:0]**: Major ETM architecture version

0x2: Version 3

Bits 7:4 **ETMARCHMIN[3:0]**: Minor ETM architecture version

0x5: Version 5

Bits 3:0 **REVISION[3:0]**: Implementation revision

0x0: Revision 0

### ETM configuration code extension register (M4_ETM_CCER)

Address offset: 0x1E8

Reset value: 0x1854 1800

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **TSSIZE**: Timestamp size
0: 48 bits.

Bit 28 **TSENC**: Timestamp encoding
1: Timestamp is encoded as a natural binary number

Bit 27 **RFC**: Reduced function counter
1: Counter is a reduced function counter

Bits 26:23 Reserved, must be kept at reset value.

Bit 22 **TSIMP**: Timestamping implemented
1: Timestamping implemented

Bit 21 **EIIMP**: EmbeddedICE behavior control implemented
0: Not implemented

Bit 20 **TSSUWP**: Trace start/stop uses Embedded ICE watchpoint inputs
1: Yes

Bits 19:16 **NUMWPIN[3:0]**: Embedded ICE watchpoint inputs
Number of inputs coming from the DWT.

0x4: Four inputs

Bits 15:13 **NUMIR[2:0]**: Instrumentation resources
0x0: None

Bit 12 **SUPPDAC**: Data address comparison support
1: Not supported

Bit 11 **RR**: Readable registers
1: All registers are readable

Bits 10:3 **XXINBUS[7:0]**: Extended external input bus
0x0: Not implemented

Bits 2:0 **XXINSEL[2:0]**: Extended external input selectors
0x0: Not implemented

### ETM trace enable start/stop embedded ICE control register (M4_ETM_TESSEICR)

Address offset: 0x1F0

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | STOPRS[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | STARTRS[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **STOPRS[3:0]**: Stop resource selection

Setting any of these bits to 1 selects the corresponding EmbeddedICE watchpoint input as a TraceEnable stop resource. Bit [16] corresponds to input 1, bit [17] corresponds to input 2, bit [18] corresponds to input 3, and bit [19] corresponds to input 4.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **STARTRS[3:0]**: Start resource selection

Setting any of these bits to 1 selects the corresponding EmbeddedICE watchpoint input as a TraceEnable start resource. Bit [0] corresponds to input 1, bit [1] corresponds to input 2, bit [2] corresponds to input 3, and bit [3] corresponds to input 4.

### ETM timestamp event register (M4_ETM_TSEVR)

Address offset: 0x1F8

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:14 **FCN[2:0]**: Boolean function

If A is defined as the first resource match and B as the second match, an event is defined as a function of A and B.

0x0: A
0x1: NOT A
0x2: A AND B
0x3: NOT A AND B
0x4: NOT A AND NOT B
0x5: A OR B
0x6: NOT A OR B
0x7: NOT A OR NOT B

Bits 13:7 **RESOURCEB[6:0]**: Second resource identifier

See RESOURCEA[6:0] field for bit description.

Bits 6:0 **RESOURCEA[6:0]**: First resource identifier

Bits [6:4] defines the resource type and bits [3:0] the index. The supported resource identifiers are listed below. Programming any other values may result in unpredictable behavior.
0x20: Embedded-ICE watchpoint comparators 1 (from DWT)
0x21: Embedded-ICE watchpoint comparators 2 (from DWT)
0x22: Embedded-ICE watchpoint comparators 3 (from DWT)
0x23: Embedded-ICE watchpoint comparators 4 (from DWT)
0x40: Counter 1 at zero
0x5F: Trace start/stop resource
0x60: External inputs 1
0x61: External inputs 2
0x6F: Hard-wired input, always true
Others: Reserved

### ETM trace ID register (M4_ETM_TRACEIDR)

Address offset: 0x200

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SWPTO**: SWP or SWPB instruction order
Identifies the order for a SWP or SWPB instruction.

0: The Load transfer is traced before the Store transfer

Bit 0 **RFETO**: RFE instruction order
Identifies the order for a RFE instruction.

0: The PC transfer is traced before the CPSR transfer

### ETM device power-down status register 2 (M4_ETM_PDSR)

Address offset: 0x314

Reset value: 0x0000 0001

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

Write:
0000: No effect
xxx1: Set bit 0
xx1x: Set bit 1
x1xx: Set bit 2
1xxx: Set bit 3

Read:
0xF: Indicates there are four bits in claim tag

### ETM claim tag clear register (M4_ETM_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Reset claim tag bits

Write:
0000: No effect
xxx1: Clear bit 0
xx1x: Clear bit 1
x1xx: Clear bit 2
1xxx: Clear bit 3

Read: Returns current value of claim tag

### ETM lock access register (M4_ETM_LAR)

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: ETM register write access

Enables write access to some ETM registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access
Other values: Disable write access

### ETM lock status register (M4_ETM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCK TYPE | LOCK GRANT | LOCK EXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the ETM_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted
1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism

The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists
1: Lock control mechanism is implemented

### ETM authentication status register (M4_ETM_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
0x0: Not implemented

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
0x0: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
0x0: Not implemented

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
0x0: Not implemented

### ETM CoreSight device identity register (M4_ETM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0013

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: Device sub-type identifier
0x1: Processor trace

Bits 3:0 **MAJORTYPE[3:0]**: Device main type identifier
0x3: Trace source

### ETM CoreSight peripheral identity register 4 (M4_ETM_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SIZE[3:0]**: Register file size
0x0: Register file occupies a single 4 Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code
0x4: Arm® JEDEC code

### ETM CoreSight peripheral identity register 0 (M4_ETM_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0025

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

# 67 Device electronic signature

The device electronic signature are either set in HW and stored in the OTP (visible in BSEC registers) which can be read using the debug interface or by the CPU. It contains factory-programmed identification data that allow the user firmware or other external devices to automatically match the characteristics of the component.

## 67.1 Unique device ID register (96 bits) (UID)

The unique device identifier is ideally suited:

- for use as serial number (USB string serial number, or other end applications)
- for use as part of the security keys, to increase the security of code in Flash memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the memory
- during processes such as secure boot.

The 96-bit unique device identifier provides a reference number, unique for a given device and in any context. These bits cannot be altered by the user.

Base address: 0x5C00 5000 (BSEC base address on APB5)

Address offset: 0x234

Reset value: 0xXXXX XXXX

*Note: X is factory-programmed.*
